# LOCOMOTIVE FIREMEN'S MAGAZINE.

---

JANUARY, 1893.

---

EDITORIAL.

---

EIGHTEEN HUNDRED AND NINETY-THREE.

---

We predict that A. D. 1893, will arrive on time—not a fraction of a second late. Emulating his promptness, the MAGAZINE sends greeting to its army of readers. "A happy New Year to all," or as Burns would state it—

"All ye whom social pleasure charms,  
Whose heart the tide of kindness warms,  
Who hold your being on the terms  
"Each aid the others,"  
Come to my bowl, come to my arms,  
My friends, my brothers,"

It is said that a vast majority of the human family pine for something new—tire of the old. Well, here is a new year. The old year has fled, gone glimmering—like a school boy's tale—and it must be said that a new year is in many regards an exceedingly valuable donation from Old Father Time, but, like the inheritance of an estate, everything depends upon its use. Wisely used it is a blessing, otherwise, a curse. This being a free country men may choose.

The MAGAZINE, while it is the organ of the brotherhood, its editor makes no pretensions to mentorship prerogatives. The time suggests

reflections, and it is in order to print them to be read or discarded upon their merits and without the slightest reference to the author.

The time has arrived in the history of our civilization when merit is the touchstone, the supreme test. True it is that merit does not always win the prize. True it is that villainy often triumphs over virtue, but it is true, nevertheless, that a vast majority of the dazzling prizes the years exhibit to tempt aspiring ambitious men, fall to the lot of men of superior merit. Take what are called the "learned professions"—law, medicine and theology. The colleges are annually grinding out graduates. Shysters, quacks and imbeciles are numerous, only the few, by virtue of their merits achieve eminence, the great majority obtain a precarious livelihood and die in obscurity.

Education, universally commended and valuable to all, is specially advantageous only to those of mental depth and breadth, who, if they have an idea are capable of utilizing it; hence the land is full of feeble minded scholars, who drift, by irrevocable laws into the ranks of cranks and vagarists and deluge society with their impractical whims and crotchets, and visionary theories of life and its duties. With such unfortunates time is without value, and 1893 will simply afford them opportunities to demonstrate the fact.

Fortunately, education is becoming more useful to the world as time speeds on, because it is bringing hand and brain more and more into alliance. For the few, Greek and Latin, and other dead languages may be well enough; and while the MAGAZINE is not interested in deciphering hieroglyphics, caring little for the symbols of the dead past, it is prudently interested in an education which the present demands. We have no disrelish of poets and poetry, and it may be that the song writers of the past and of the present are the world's great benefactors, but it should be remembered that poetry devoid of an idea is not, to use a mining phrase, "paying dirt," and the volume of such trash now offered, were it weighty, would supply cargoes for the merchant marine—sail and steam, of the world.

Tennyson said:

"I hold it truth, with him who sings  
To one clear harp in divers tones,  
That men may rise on stepping-stones  
Of their dead selves to higher things."

But we hold it truth, that he who makes a steam or an electric engine, a sewing machine, a reaper or a mower, who can wind railroad track around mountains, from base to summit, who can build bridges to span chasms and rivers, who can tunnel through mountains and under rivers, who can build ocean greyhounds, are greater than all the poets, from Homer to the sweet singer of Michigan. We think an hour spent in the electric magician's Menlo Park, sees and hears more poetry in an hour—singing, sighing, flashing, scintillating, arousing, captivating and inspiring poetry, than the world has known in a thousand years. Edison sings to the one clear harp of electricity, and as he sings, new lights flash in the darkness and the world grows brighter. The music there is in the ring of the anvil, when the stalwart smith makes it a harp upon which to beat out the nails of civilization, makes every note a stepping-stone to higher achievements. We think in the blended melodies of the whirring spindle and the clicking shuttle, there is poetry, such as the world needs, whatever may be the choice of Patti's votaries. If merit is the standard, if those things are best that lift up the poor—sweep into oblivion the corrupting and debasing distinctions the past has unloaded upon the present, then, that education which enables the hand to respond to the brain is worthy of the palm.

The MAGAZINE has often indulged in reflections relating to the possibilities of success which may be grasped by men born to toil, who, if they climb must hew out the pathways by which to ascend to success—and as we write, an army designated as “men of courage and conviction” come into view. It is a grand procession. In all of the long line there is not one engaged in bottling moonshine, nor tugging at his boot straps to “get on top,” nor to “get even” with any other toiler. There is neither scab, traitor nor conspirator in the ranks. They are men, who, as the years have come to them, permitted no opportunity to pass unimproved. These men, seen with the mind's eye, entered the ranks of labor in their boyhood, and having kept steady step to the drum-beat of duty, have reached higher elevations and won a gratifying measure of success.

The great majority of them were once locomotive firemen—now engineers, master mechanics and other officials of still higher grade in the railroad service of the country. In the beginning of their career, their education was limited—their school days were past, and

they faced the stern future with a limited equipment of book knowledge. But they had clear heads, courage, strength of body, self-reliance, ambition and an iron will. The lessons of their lives, had we space to recite them, would serve as beacon lights to others. They were workers, and they were students of books, men and opportunities. They had no idle hours. Their leisure was devoted to mind culture. Their hours were made stepping stones to higher things. They said, "with me, merit must win; my credentials for promotion are the things I know, the character I have won in the struggle to achieve success." Upon such things they staked their future and reached the goal.

The year 1893 finds the army of young recruits ready to engage in the battle, and every day is to be a battle. The courageous, the *time savers*, the students, will achieve victory. The epitaph of those who pursue a different course can be written now, in one word—"FAILURE."

Young men, in 1893 as in other years will take their choice, and coming years will chronicle their victory or their defeat.

The MAGAZINE expresses the belief that 1893 is to be one of startling developments. We indulge in none of the current vagaries about a conflict between capital and labor. There are capitalists who fight labor; we do not anticipate any diminution of their number, but, we do expect to see them checkmated in their schemes of piracy. As we write there can be heard, all along the line, salvos of cheers, that the Carnegies, Fricks, *et al*, are no longer to be the favorites of unequal laws that they may the better pursue their robberies. The people have awakened to the fact that justice, long since bludgeoned into silence, must be enthroned, and the grand coronation day is approaching.

We anticipate that during 1893, labor, if alert and vigilant, will achieve victories in legislative halls which will redound to its peaceful emancipation from degrading thralldoms, and make it still more potential in shaping the destiny of the nation.

If the year 1892 taught workingmen any lesson worthy of heed, it was that the capitalistic class, like a devil-fish had grasped them with its tentacles and was dragging them down to fathomless depths of degradation. To escape the prehensile clutch of these monsters, constitutes a standing challenge to organized labor for 1893, and de-

mands of workingmen an amount of sentinel duty which must be performed if victory is to perch upon their banners.

Again, if workingmen can be taught by experience, by the admonitions of history, by the shadows of coming events, by trials, conflicts and defeats, they will make 1893 a year distinguished by the severest study of labor problems. They will study the legal and ethical phases of labor problems; they will note what the pulpit and the press are doing to promote justice to labor; they will comprehend the supreme importance of cool heads and honest purposes in the persons of those who assume to be leaders; they will demand that jealousies and rivalries give place to a singleness of purpose which seeks to promote the welfare of all. If such things are done A. D. 1893 will be fruitful of victories for the cause of labor.

Does some one ask, what of the MAGAZINE? We answer, what of its past? Has it been like the barren fig tree in the parable, fruitful only of leaves? Has it borne no fruit for the sustenance of labor, for its brain and brawn? Has it trailed the labor flag in the dirt? or, has it kept the banner high, advanced, and forever floating in the winds of heaven?

The MAGAZINE for 1893, will be the organ of the Brotherhood of Locomotive Firemen, always on duty to guard the interests of the order and to repel attacks without regard to who is behind them. It will expose shams, and treasons to labor, whenever and wherever found, totally regardless of their authors or patrons. The MAGAZINE speaks for organized labor in all of its branches and for the weakest with a declared purpose of helping it to grow and be strong. Proud of its achievements in the past, and now more than ever in its history self-reliant, the MAGAZINE will keep step to the stirring music of progress.

We began this article by sending to each and all, greeting, "a happy new year," and we close by repeating the salutation—a happy new year to all.

---

## EVOLUTION.

---

In writing of evolution there is no purpose to investigate or criticise Darwinism relating to "man's place in nature." We take man's place in nature as it stands to-day regardless of his creation. His remote ancestors may have been apes or tadpoles, or, he may have been created as the Bible proclaims. In any case there has been going forward in processes of evolution a steady unfolding of mental powers, whatever may be said of man's early physical endowments. It is quite possible that in the processes of evolution, man has lost in physical strength and gained in mental vigor. Indeed, investigation, we think, would lead to such a conclusion. This mental energy, it is noticed, exhibits greater development in some men than is found in others and, as a result, the men of the largest brain or mind power manage to rule those of inferior intellectual grasp. To state a general proposition, the evolution of intellectual power is consequent upon education, which is the great unfolding force. Hence, it follows, that those who command the largest educational advantages control those of inferior opportunities. To equalize these opportunities is the great purpose of the American free school system, to secure to all mind evolution, the unfolding of its powers, so that the humblest citizen may become a thinker and be prepared to maintain his independence in all conflicts that may arise between contending classes.

If a man is qualified so much as to read correctly, he, to a certain and to a very large extent, becomes responsible for the progress he makes in mental evolution. Being able to read, he can, if he will, avail himself of the advantages which books confer upon those who read. In that case the processes of evolution go forward with an ever accelerating rapidity. As he reads, his mind expands, unfolds, grasps and solves, and instead of being ruled by others he becomes a force and a factor in government, and in all affairs pertaining to his welfare.

In commerce, in finance, in industries and in labor the processes of evolution are challenging the attention of men of thought. Intelligent workingmen are profoundly interested in these wonderful exhibitions. They behold new forces in operation and are studying with intense concern to ascertain in what regard they contribute

to their well being. In the evolution of business affairs, they behold the concentration of wealth and the power which wealth confers in the hands of the few. They behold the machine everywhere taking the place of men. Unable to counteract such processes of evolution, even if they were desirous of doing so, they inquire with ever increasing solicitude, what must the end be? What, if anything, is evolution contributing to the welfare of those who toil?

If the concentration of wealth in the hands of the few, if trusts, syndicates, corporations and monopolies are the results of evolution on the one hand, it may be affirmed that labor organizations are also the fruits of evolution, and it is just here that comes into view the theory of survival. In evolution as it relates to animals and plants, the strongest survive, the weak go to the wall—disappear—sometimes styled “the survival of the fittest” but always the strongest. It must be granted that when large mind forces are in alliance with wealth, immense strength is developed, and as against ignorance and poverty, the latter must succumb, except incidentally and spasmodically, as in the early days of the French Revolution.

But when the eye surveys the field of organized labor, the fact comes into view that evolution has already accomplished wonders for those who toil. The labor mind as a whole has unfolded to an extent productive of amazement. Grasping every problem that relates to its welfare it is accomplishing results along the line of its active forces, that bear the stamp of practical wisdom, and in the discussion of the fittest, or, the strongest, labor is developing staying qualities which are creating anxiety in the ranks of those who have believed themselves to be the favorites of evolution. They have claimed that their education and their wealth conferred upon them not only the power to rule, but the right to rule, while labor, on the other hand, points to the fact that its mind forces challenge scrutiny; that its skill is more to the world than money. And then, when labor calls the roll of its membership and the men step forth to be counted, the army, the standing army of labor, appalls those who surmise that labor is simply a machine to be operated for their benefit.

We unhesitatingly declare that such are some of the advantages that have come to labor by virtue of evolution, and quite as unhesitatingly do we aver that up to this day labor fails to comprehend,

scarcely in any measure whatever, what emancipating blessings evolution has conferred upon it. It not only does not put forth its hand to grasp and utilize its inheritance of power, but wedded to jealousies and selfishness, courts defeat and prefers degeneracy to independence.

If this debasement were universal, we should say that evolution, going forward during all the centuries, had accomplished nothing whatever for labor—and if we wanted an illustration of the fact, we would point to the condition of labor on the Reading Railroad, where men yield up their independence, and like so many peons or helots, wear the badge of servitude placed upon them by McLeod—men who dare not light a lodge fire and proclaim their emancipation from a slavish condition. For such men, neither evolution nor revolution could lift them in a thousand centuries, one inch above the dead line of their degradation.

But, fortunately, such soul inferiority is not universal, nor yet a distinguishing feature in labor affairs of the period. Evolution has not simply unfolded the intellectual powers of the plutocratic class. It has laid its redeeming hand upon millions who toil and now, by rights divine they are organizing—a movement preceded by thought and carried forward by thought, to be crushed out only when Gabriel or some other commissioned herald proclaims that the pendulum of time has made its last vibration.

But there is a demand for still further evolution in the world of labor. While the armies of labor are divided, and are under the leadership of men who from any base ambition hold their positions to promote selfish ends and aims, plutocrats and their wealth will rule. With such men, evolution has no significance beyond the boundary line of their own mercenary meanness. But they cannot resist the silent, ceaseless operation of evolution. They will die not too soon for labor's emancipation from the thralldom of prejudices they promote. The labor world, if evolution proceeds—and go forward it must, for such is the law—will unify upon all questions where rights are involved. Labor organizations, separate as waves but one as the sea, will mass their tremendous power for self-preservation. It is the law—the trend, we shall hope to see its sublime exhibitions of power. We should like to see it come as comes the dawn, with pencillings of light and rising orb, advancing in a cloud-

less sky to noon-tide glory. We should like to see it come, as comes the vernal season, with its sunshine and shower, buds and flowers and fruits, while all the feathered songsters make the woodlands vocal with their melodies—but, come it must either gently or with exhibitions of wrath and terror. Labor is the subject of evolution and its forward strides arouse the nation. Too great to be intimidated, too resourceful to take a backward step, its future is destined to be the climax in the process of evolution, since man started on his upward march towards the elysian fields of independence.

---

## THE LABOR VIEW OF THE ELECTION.

---

The LOCOMOTIVE FIREMEN'S MAGAZINE is not a politically partisan publication, only to the extent that when a citizen who is an enemy of labor aspires to office, the MAGAZINE would have that aspirant defeated, regardless of party platform, banner or shibboleth.

The country has passed through a presidential election, in which labor was as conspicuously identified as any other interest that was or could have been named, and the question arises, wherefore this interest and solicitude?

In this discussion the MAGAZINE discards all reference to the personnel of tickets, except in so far as such allusions refer to the welfare of organized labor.

Whitelaw Reid, all of the years that he had been in a position to employ men, was distinguished as an inveterate enemy of organized labor. As an owner and publisher of a great newspaper, he had evinced a hostility to organized labor so relentless as to become a public scandal. This the MAGAZINE deemed it its duty to expose in the light of established and notorious facts. Let this suffice.

The Democratic party succeeds the Republican party in the national government and in a number of states hitherto Republican in politics. In this sweeping change are there any comforting lessons to labor? If so, what are the lessons?

The discussions of the campaign were largely economic. Such questions are abstruse and easily mystified. Hence, labor has sought industriously for a few fundamental facts and principles to which it was easy to refer and were impregnable to the attacks of sophistry, calculated to mislead the mind and culminating in erroneous conclusions. Manifestly, the pivotal question of the campaign was that of the tariff, and we doubt, if, within the entire realm of economic questions, there is one upon which there is such a wide and honest disagreement; and yet, in this, as in every other question of national importance, there is a principle involved which, found and embraced, emancipates the mind from the thralldoms of error.

Admitting that the principle of protection is right, the next question is, should it be so warped and distorted as to protect a favored few to the neglect of the many? If a tariff does that, then justice is discarded and wrong triumphs. In a nut-shell, should Carnegie and Frick be protected, whereby millions accrue to them, while their workingmen have their wages reduced and are made to realize that though employed in carrying forward a tariff-protected industry, the same tariff affords them no protection, but even makes their condition worse? Nor is this all. Labor has asked the question, why should certain industries be protected, while others are left to succeed, if they can, without such protection? Various reasons were assigned for this admitted injustice, but it is evident that labor was not satisfied with the arguments adduced; such protection was not, in the first place, fair play. It did not afford all industries the same advantages. It taxed one to support another, and was, therefore, in direct conflict with the genius of American institutions.

Again, it was held, during the campaign, if a high protective tariff protected certain industries against the importation of what is termed "foreign pauper labor products," it furnished labor no protection against the importation of "foreign pauper laborers;" they came by thousands and by tens of thousands, and offered their services for "pauper wages," and as a result, while the hue and cry in favor of protective tariff was loudest, organized labor, as in the case of Homestead, found it impossible to maintain wages, and thousands of workingmen are suffering because they had the independence to resist, not only a reduction in wages, but the murderous policy of a protected industry to introduce scabs, and thus compel unprotected labor to submit to con-

ditions fruitful of poverty and degradation. In all of this, in so far as labor was concerned, strictly speaking, there was no partisanism. It was an economic question; and as a high protective tariff, as we have shown in the case of Homestead, did not protect organized labor, it was pronounced a failure, and the edict has gone forth for the modification of existing tariff laws.

There were other economic questions involved in which labor has a vital interest, as for instance, the free coinage of silver. Here again, comes into view a question in which labor has a right to be heard. First, because mining silver is a great American industry and gives employment to thousands of workingmen. Second, because free coinage affords a market for the product of the mines, and third, because silver coin is honest money, and no man ever failed whose silver dollars were equal to his debts.

Again, free coinage is in direct opposition to the policy of plutocratic millionaires, styled "gold bugs," whose policy has been and now is, by virtue of the single gold standard, to control the financial affairs of the nation, and control values. Labor takes no stock in such a policy, and on a direct vote, would overwhelmingly declare for the free coinage of silver, and the fact that when silver certificates are issued there is a silver dollar behind every certificate, emphasizes the fact that whether a man has the coin or the certificate, he has honest dollars.

We could extend illustrations showing that in the political campaign just closed, labor was everywhere an issue and that all political parties sought to give it prominence. It remains to be seen what the victorious party will do in legislatures and in congress to redeem the pledges made to labor. Much is required to modify present laws, and to enact others which shall give to labor a standing in the courts of the country, equal, in all respects, to that occupied by those who command money, and who, hitherto, when they have wanted a court went out and bought it. As the fruits of the election are gathered into law making bodies, the MAGAZINE will endeavor to outline special requirements.

# CONTRIBUTED.

---

## BE FAIR AND BE HAPPY.

---

BY J. HAMPTON MOORE, OF THE EDITORIAL STAFF OF THE PHILADELPHIA LEDGER.

---

An invitation from the fluent and usually pointed editor of the *LOCOMOTIVE FIREMEN'S MAGAZINE* to write something for that journal, carries with it an attractiveness which it is hard for any well wisher of labor to resist. But it also carries with it the possibility, which, in this instance, the writer would be happy to avoid, of running up against the fine steel of some other contributor, or even the able editor himself, thereby provoking a controversy which might be unfortunate. Not that a little discussion, or even a few pungent digs, are not sometimes productive of good; but in the labor world, especially, where harmony should be the watchword, they tend, as shaft follows shaft, to embitter men and break ranks. This is the kind of business no true friend of the workingman will engage in knowingly, but a great many do engage in it for a momentary advantage, which, while it satisfies one humiliates another, working harm instead of good.

Still, when a man starts out to say something publicly, either in a speech or in print, he should have opinions, and having them, he should express them without fear of the motives that may be attributed to him. But he should express them in such a way as to show that he is sincere, and when he does that, whether others agree with him or not, he should be treated, at least, respectfully. This is what I would hold to be good doctrine anywhere, and I hold it should be particularly observed in the ranks of labor, where the sensibilities of men are so easily aroused and where friends or enemies can be so quickly made. A good temper, a generous disposition and a kindly tongue are excellent attributes of manhood, and they win more battles for labor than all the strikes that were ever concocted. I don't mean an oily tongue nor the tongue of a sycophant, but a tongue that speaks from a heart that is fair and manly, and that reasons for the other side as well as for its own.

I have been closely connected with labor matters for years. My business as a newspaper man has given me acquaintances on all sides; I have none of them to thank for special favors and I have a good many to remember without malice, but for memory's sake, for petty annoyances of various kinds. Apart from all this however, a sense of fairness—due in part to the fact that the paper I represented had no axes to grind, and simply desired to get at the truth and give

the news—has never permitted me to accept a hot-headed story from any side without examining the facts the other side had to present, and it has been demonstrated time and time again that “the tale of woe” has been more than offset by an honest investigation of the merits of the case. These and other incidents have often set me to thinking whether it is altogether wise for labor to draw the line so distinctly between itself and the rest of the world as to have itself stamped as “a class,” in our great American society. Some, I am aware, will say that we are drifting into classes—the aristocrat and the laborer, the rich and the poor, the millionaire and the tramp, and so on—but I do not believe there is anything in the rise or fall of an individual, high or low, for the honest workingman to fear. Unscrupulous men may become rich, indolent and vicious men may become tramps—that would occur, perhaps, under any condition—but that a man has no right to become rich, I am not willing to admit. If we do deny the right to any man, then why are so many of us contending for more than we have of the world's goods? No, it would be better for us all, instead of grumbling because others succeed, to strive to succeed ourselves, following high moral ideas on our own account.

It is the comparing ourselves with others that makes us unhappy. I don't believe in worrying because John Jones has grown rich, and I don't believe in growling because John Smith has been promoted from the position of a brakeman to be the president of the railroad. If Jones was industrious and took advantage of opportunities which I was too blind to see or too lazy to improve, Jones deserves to go ahead. It is not because Jones is rich that I respect him, it is because he has merit. And so it is with the brakeman. If Smith is capable of being president of the road, and can run it profitably enough to pay its employes and stockholders, besides giving me the benefit of good train service, I have no reason to be envious of him, not if he makes ten times as much a day as I do. So, in my humble judgment, workmen ought to deal, not only with each other, but with the outside world. We are all workmen. In fact it is a puzzle to discover wherein the man who wields an axe or pushes a wheelbarrow, is any more entitled to be called a workingman than the fellow who sits on a high stool in the counting house, poring over columns of figures, from dawn till sunset, or than the good housewife who is going all day without (or even with) complaining. We all fill a place in this world, and the worthless are very few indeed. We may be getting a little crowded, but that is no more the fault of the rich than it is of the poor.

Let us be a little more frank. Don't we all get rather tired of hearing so much from labor leaders about “the down-trodden masses” and “capitalistic barons;” about “the horny hands of labor” and “the velvet hand” of wealth? Well, if we don't, all right. My opinion is, that the man who insists on calling himself a slave was cut out for one. He can lay back if he wants to, and refuse to budge, and he may be happier in doing so than if he aspired for a higher place and failed to get it, but I cannot see where he has the right to

stop you, or me, or any other ambitious and progressive man, who don't want to remain behind with him. We all can't have first place; we all can't have what we want. The man does not live, and never did, who got all he wanted out of life. The Great Creator of this universe seems to have ordained that none of us should have. Why, then, should we not learn to be a little better satisfied with the things we have than to be forever making ourselves unhappy because others have what we have not. Of course, there are many issues growing out of this argument that cannot be discussed in an article of the length of this, but the general fact remains, that we could make our own lives and the lives of others pleasanter, if we would. We want to appreciate merit and industry more, and be a little more real and a little less professional in what we say and do ourselves.

It often occurs to me that the tendency to begrudge other men prosperity, leads ardent labor advocates into frequent bursts of unfairness. I am no admirer of Jay Gould, yet I could not conscientiously denounce him, as I have so often seen it done by others. He may be a mean man and an unjust man, but has he done no good? Did Andrew Carnegie do no good? I don't mean charity. I mean have Gould and Carnegie not been of some use to the community? It cannot be successfully denied that they have; that they have made it possible for good to be done that was not done before by anybody who had the opportunity to do it. No matter whether one wrecked railroads or not, he opened up new ones and gave employment in new fields. The other built great iron and steel works, which many of the recent Homestead strikers hailed with loud acclamations. There is all the difference in the world in the feeling you have when you sit idle, wondering what to do, and the feeling you have when you hear that somebody is going to start a works and give you employment. Then is the time you want that "somebody" to succeed, and that is the time that you wouldn't want to be in that "somebody's" shoes for a great deal. I refer to this merely to show how we ought to be fair in handling the names of wealthy men, with whose business management we may not agree. They have had struggles and we should give them credit for holding together the concern from which comes our means of procuring daily bread. Better we should have railroads than not have Jay Goulds; better we should have steel works, including Andrew Carnegie, than not have them at all. Unless men of this stamp take money from circulation and lock it up in a strong box, their riches can do us no harm, for the more castles and yachts they build, and the more banquets and balls they give, the more workmen are employed in the various pursuits necessary to produce the material needed. I have no quarrel with the rich who spend their money; what they consume of themselves is but the measure of an individual capacity. They cannot have more; the rest comes back to the people.

It is not, by far, the active rich man who is happiest. Men who picture him so belie him. With the workingman who has a good home and feels safe against the needs of old age, he stands no comparison. Basing the matter solely upon the tenor of the excellent letters to the

Woman's Department of the LOCOMOTIVE FIREMEN'S MAGAZINE, I would be willing to lay a wager that 1,000 firemen could be easily picked from the ranks of the brotherhood, men with dust-stained faces, who carry dinner pails, who are happier in every fibre of their beings than Jay Gould ever was. And they are happy, not only because God made them so, but because no living monopolist, nor all monopolists combined, could get along without their services or rob them of their freedom or of their home surroundings. And furthermore, let me venture to suggest that if the thing could be brought about, there would not be one in the 1,000, who, if given Carnegie's place to-morrow, would not be homesick inside of six months. Carnegie may be the medium through which vast sums of money pass; his may be the master hand in extensive manufacturing deals, but I warrant he lacks the elements of happiness that characterize a contented fireman in his modest home. To all of which, so hastily presented, I would like to add that life is so short we would all do well to get along with our fellows as smoothly as possible. We can be everlastingly disputing if we want to, not only with employers but among ourselves, and the tendency is neither to prolong life nor to promote happiness. Let us be as fair and as happy as we can.

"Honor and shame from no condition rise;  
Act well your part, there all the honor lies."

---

## "SHALL THE PEOPLE OWN THE RAILROADS, OR---?"

BY CYRUS FIELD WILLARD, LABOR EDITOR BOSTON GLOBE.

---

There are no class of men who are so vitally interested in the answer to the question in our title, as the railroad men.

It comes close to them in their every day life, closer than to any other class of people. It affects the instruments by which they gain their daily bread where in other men it appears a matter of sentimental interest.

It is strange therefore that railroad men have not discussed this matter and pushed it forward as they alone are capable of doing from the knowledge which they have gained from practical experience and which cannot be gainsaid.

Increased wages and less hours of labor? Why in what manner can they be so effectively obtained and so without cost as in the agitation for the whole people owning the railroads instead of the few. If the agitation was only intended as a bluff, what weapon would bring the proudest corporation to terms so quickly as a demand

from their own employes that the state or national government should take possession of its lines and run them in the interest of the people. With the constantly increasing number of the unemployed due to the introduction of labor-saving machinery, strikes are fast becoming inoperative. They would be total failures in most cases were it not for the class feeling now universally felt that impels a man to starve rather than to "scab."

This being the case, it behooves the railroad men in their organized battalions to consider seriously whether or not it is possible to achieve their ends in the shape of better conditions of life and labor, by other means than the old-fashioned strike. The Brotherhood of Locomotive Firemen which stands in my mind as the leader in the railroad men's organizations, by reason of its compactness, aggressiveness, esprit de corps and generalship, should take this matter up and for that reason I write this article for their serious consideration.

In treating this subject I wish to consider it under two heads:

1. As affecting the railroad men as a part.
2. Its effect on the general public as a whole.

The question is "Shall the people own the railroads or shall the railroads own the people?" The question, if such be the alternatives, admits of but one answer. The people must own the railroads. Any one who studies the signs of the time, knows that the alternative has presented itself clearly to the American people from the shameless debaucheries of state and municipal governments and, yes, the national government itself, so that the issue is up for discussion.

But for the strange and peculiar apathy of the railroad men themselves, which I confess I am unable to understand, the matter would have been nearly settled by this time. There is a strong sentiment among the people in favor of taking possession of the railroads and do away with the power that is given them to raise princely revenues which can be and are devoted to purchasing officers who can give them favors. The necessity for such favors and the necessary revenues to do the corrupting would alike be wanting under governmental ownership. If the matter was submitted to popular vote to-day there would be an overwhelming majority in favor of governmental ownership.

On the trade union basis, there could be no better fate befall the railroad men than to have the railroads owned by the government, the organized executive of the people's will. Wages would be higher. It is a well known fact that the government employes' wages to-day are higher than men doing the same class of work in private business. Reason: no necessity to screw down wages to make a profit.

The hours of labor would be less. There would not be so many cases of overworked men going to sleep and their trains being wrecked from too long hours of labor under government ownership. The administration that would permit the great railroad horrors to occur from too long hours of labor would be swept out of office at the next election. In fact the tendency (as it can easily be seen)

would be to reduce the hours of labor down to such a low number as to make the train crews almost pampered from being not permitted to work more than two or three hours a day lest an accident should occur and their superior officers like the present board of directors should be swept out of a fat office.

Another strong, and incontrovertible argument in favor of the people owning the railroads, is that it is the strongest and best agitation for eight hours.

"The government employe only works eight hours. We want to be government employes!" should be the rallying cry from now on for every railroad man in the United States. By an eight hour law, the government has established the eight hour day for its employes, and as soon as the railroads come into its hands the railroad men stand on the same footing as the other employes.

Favoritism in the public employ? Could there be one quarter as much as exists to-day in the private corporations where the nincompoop relative of the president or directors are put in responsible positions so often that there is no comment except from the subordinate who is obliged to do his work, while his superior (?) draws a fat salary with no effort?

Lose your job every four years? Are you sure to keep your present job a year under private corporation rule? Is it not better to have a certainty of four years than no certainty at all? The fear of being "fired" at the expiration of four years does not seem to act as a deterrent on persons applying for government positions. I never knew of any post office being unable to be carried on on account of inability to get clerks. Did you ever hear of any strike among government employes in this country? They simply present their grievances before the proper committee in Congress and it becomes the property as well as the "cause" of the public. The grievance committee is not "bounced" nor its members blacklisted, nor are they obliged to strike because the high and mighty president or directors or superintendent will not receive them. Pinkertons are not hired nor is the militia kept under arms liable to be called out at a minute's notice when any large number of government employes have a grievance.

"Remember Buffalo" is a phrase that would seem to me to be so pregnant with meaning, that to the average railroader further argument would be unnecessary.

If it is true that government ownership means for the railroad man increased wages, eight hour day, lack of favoritism, more security in holding his job, and ability to approach his superior officers without being discharged and blacklisted, is it not worth working for? I defy any one to prove that it does not mean all this. If such can be secured by a peaceful agitation without the necessity of a long and costly and possibly bloody strike, should not steps be taken to immediately secure all these blessings?

Concentration must be the watchword to secure all these blessings as quickly as possible. The firemen are as well equipped to begin this work as any and they have a peculiar incentive so to do, as un-

der the eight hour law there would be more engineers and the firemen would get a chance to become engineers. How is that for a point for the firemen to consider? Let the question be taken up at the next session of the grand lodge and after being discussed there, referred to the local lodges for discussion. The question to be discussed could be phrased as follows: "Is there any method by which the wages of firemen can be raised, their hours reduced and their general condition improved, as easily, as quickly, as peaceably and as bloodlessly as by the government ownership of railroads?" Once decided in the affirmative, let all minor matters be dropped and the whole enginery of the brotherhood utilized to place the facts before the public. Practical railroad men can do this in such a manner as to leave the opponents and paid capitalistic agents, not a leg to stand upon.

One more point or two before closing under this head although the arguments in its favor seem inexhaustible. There would be a better class of men attracted to the railroad service on several accounts. One of these would be the fact of more wages and less hours of labor. Another would be the elimination of the element of danger which makes so many men reckless and devil-may-care in their actions. By the government owning all the railroads it would be possible to secure uniformity in the styles, height and equipment of cars. The automatic coupler would then be an actuality and in use where now it is a theory, a rainbow whose chaser is the organization which believes that the corporations will permit it to be adopted if it interferes with their dividends. The terrible slaughter and maiming of tens of thousands yearly would stop. Few indeed are the men who may read this who have not lost a chum or friend whose life might have been spared if the train had been equipped with the necessary safety appliances as would be the case if the roads were owned by the people.

Grade crossings and varying heights of bridges from tracks are also matters which could be very easily disposed of if the railroads were under one management. These while affecting the trainmen's daily life are also subjects of concern to the general public and will be considered under that head. The possibility of bringing all the roads under one management is an easy question now. East of Chicago it has simplified itself down to the Pennsylvania and the Vanderbilt lines. The Reading is virtually an annex of the Vanderbilts as the Baltimore & Ohio is of the Pennsylvania. West of Chicago, the development of new territories has not permitted so marked a concentration of properties as East but it will come in a few short months.

This is also a point which interests the general public and I will leave the discussion of these matters to the next month's issue.

If there are any statements in this article which can be controverted I should be pleased to have it done. It seems to me that there is no question which so vitally concerns the railroad men as the government ownership of railroads. There is nothing which will benefit them in so great measure as it. It is easy to say it is

"socialistic" and decry it on that account but that is all sentiment and bosh. Calling names is no argument. What we want is something practical and if raising wages and securing the eight hour day with good positions through government ownership of railroads is not a good, sound, practical common sense way of obtaining results, then what is the Brotherhood of Locomotive Firemen organized for?

[To be continued.]

---

## MISS JEAN'S ENGAGEMENT RING.

---

BY BESSIE MORGAN.

---

I don't wonder that you are pleased with that ring, Mary, 'tis pretty. I s'pose the clover leaf's for good luck, an' the diamond dew drop makes it real han'some.

I never see one jest like it afore, an' I've seen all sorts of engagement rings in my time, too. Did I ever tell you 'bout little Jean M'Lean's? I reckon nobody else ever had one quite like hers, an' you'll gree with me when I tell you 'twas a napkin ring—silver filagree, an' delicate as could be, an' she was as choice of it as ef't had been all set round with diamonds. But this was how she came to have it, 'stead o' one o' the reg'lar sort:

I s'pose you don't 'member when the war broke out—the war o' the rebellion, I mean. Course you wouldn't; 'twas all over with 'fore you was born. But it really is kinder strange how few folks you can find, now-a-days, who'll own up to 'memberin' anything 'bout that war.

Well, 'twas the first winter after the war broke out that Miss Jean was teachin' the destrict school.

There'd ben a good deal o' talk 'bout lettin her have it, for she wa'nt but eighteen, an' some o' the boys was oldr'n she was. But they couldn't get nobody with such a good education as she had. Her father hadn't spared no expense; he'd give her a reg'lar seminary course, an' then, jest about the time she come home, all their bad luck set in.

The bank her father had most of his money in failed, an' he had losses in other ways, an' worryin' 'bout it all brought on a *stroke*, an' there he was, most helpless.

Jean an' her mother had a hard time on't. They had a big farm on their hands, an' a farm's an onhandy thing for a woman ter manage, best o' times, an' it takes money ter run 'em.

Well, Jean she took the destrict school for the summer, an' she got on real well. The scholars they all liked her, an' the committee was satisfied with what they learned.

So when winter come round they knew she needed the help bad enough, an' they wanted to do what they could for her, so they jest said let her try it.

Course everybody knows the winter school in the country is a very different thing from the summer school. A good many young men go then that have to work the rest of the year, an' some on 'em are apt to be pretty rough, so 's a gen'ral thing the committee calkerlates to hire a good strong man for that term who's able to tackle 'em.

Jean she knew 'twas goin' to be hard work, but she wan't one to cry 'fore she was hurt, an' she kinder thought the boys would be her friends, so she undertook it.

Don Carter wan't one o' the boys that was after a education. He'd finished his two or three years before, an' ben off skylarkin' round the country ever since, seekin' his fortune, I spose.

He was a wild 'kind of a fellow, though I never heard anybody say he was really bad. He was one o' the sort with more steam on board 'n he knew what to do with—allus runin' inter scrapes 'cause he must be doin' suthin'.

Well, course he was jest crazy to inlist. He was doin' real well up in Maine, in the timber business, but he throwed it all up an' come home to go inter the army.

His father was mad enough with him. He was all for peace, Deacon Carter was, an' he said no son o' his'n should go to fight. He talked so much, an' Mrs. Carter felt so bad 'bout it Don give in, an' then 'twas he took it inter his head he'd go to school fur the winter. Everybody knew 'twas jest 'cause Jean M'Lean was teachin', but he stuck to it. There was a lot o' things he needed to know he'd never learned that would help him no end with his business, when he come to go back to it. His father was glad to have him do anything to take up his 'tention an' keep him to home, so he didn't make no objections.

But, Don, he made Miss Jean a sight o' trouble. He didn't have to do no studyin', for he knew his lessons 'fore he begun, so he had all his time for cuttin' up.

He really didn't have no idea how he was botherin' her, for he was a good hearted boy, with all his faults.

But his folks an' her'n had allus lived side by side, an' he'n Jean had played together when they was little, an' thinks likely it kinder p'voked him the stiff way she treated him now, orderin' him round as grand as if she was forty years old at the very least, an' he one o' the smallest o' her school children.

Well, Jean she reproved him agin and agin for his triffin' ways, but it didn't make no difference; 'peared as ef he was 'bliged ter try an' tease her whenever he could, an' course it didn't have a good effect on the rest of the scholars, an' Miss Jean, she made up her mind she wouldn't have no more on't.

So one night when she come to dismiss the school, she told Don Carter he might keep his seat.

The rest on 'em went out kinder smilin' 'mong themselves, an' one an' 'nother was sayin' they guessed 'twant no great hardship for Donald ter have ter stay'n talk with the teacher.

But Jean she pertended to be correctin' exercises, an' she waited till they had all gone out and the door shut to. Then she raised up her head an' looked at him with all the dignity she could get together.

She was a slim little thing, with the prettiest grey eyes you ever see, an' a color in her cheeks like peach blossoms, an' Don was a great fellow, over six feet, with shoulders like a young giant. He was a good lookin' boy, with a sort o' tawny colored hair, that was allus droppin' down across his forehead, an' he had a dreadful takin' way o' lookin' at anybody, when he pleased. For all his sassiness folks allus liked him.

But Miss Jean wan't in no humor for foolin'.

"Carter," sez she, stern as could be, "I have kept you after the others to-night, to tell you I don't wish you to come to school any more. Since you can not behave with propriety, or treat me with that respect which is due my position, I must decline to give you instruction any longer," sez Miss Jean, very grand an' imposin'. She waited a minute, but Don didn't say anything, an' she went on a little faster this time, with a sort of catch in her voice. "I suppose you think I'm not old enough to teach you, but the school officers who 'pointed me were the ones to judge of that. I shall give them my reasons for dismissing you from the school. I am very sorry—I thought you would be my friend instead of givin' me trouble. Have you anything to say for yourself?" comin' to a stop very sudden.

"No, Miss Jean," sez Carter; "I've nothin' ter say." But he met her eye as steady'n square as ef he'd been the best boy in the school, an' Miss Jean she jest turned her head one side an' wouldn't look at him.

"You may go," sez she. "I shall not expect your attendance to-morrow."

"It's gettin' rather late," sez Don, as he passed her desk, "May I see you get home safe, Miss Jean?"

"Thank you, no, Carter," sez she. "I don't need any escort." So Don went off."

An' then Miss Jean, when she'd made shure he was gone, she laid her head down on the big school dictionary an' cried an' cried. She knew 'twas foolish ter give way so, but she was dreadful tired, an' she had had a hard time all round, an' anybody that's ever tried ter keep a lot o' unruly boys and girls in order for long 't stretch can testify that its tryin' to the nerves.

She couldn't wait an' have her cry out when she got home; that would bother her mother. Here was her only chance, and it did seem like a real luxury. Then all ter once the school room door opened, an' there was Don's voice again. It fairly made her shiver.

"Miss Jean," sez he, "Don't you think it's gettin' rather dark for you to walk home alone?"

Miss Jean she didn't raise her head nor answer, hopin' he'd go, but that wouldn't a ben Don Carter. Course he come up ter see what was the matter, an' the next minute he was on his knees 'side her on the platform, spoken fast, as ef he was half scared an' kinder mad at her, too, an' I reckon that was how he felt—an' a good deal ashamed of himself into the bargain.

"What do you mean by cryin' here all by yourself in the dark?" sez he. "It's never because of my foolishness, Jean? I didn't suppose it really teased you. I'll stand all day long to-morrow with my face to the wall, to make up for it. Stop cryin' Jean!"

"Go away, Carter," sez she, her voice all choked, and not raisin' her head.

"I'll not go away," sez Don gettin' sarsy again 'fore he knew it. "You're spoilin' the school dictionary," sez he. "I can't have the town's property ruined in that way. If you *must* cry, it won't hurt my coat. It's ben wet before."

An', ef you'll believe me, he actually had the impudence ter put his arm around Miss Jean's neck an' lifted her head up 'tween his two hands, whether she would or no, an' laid it down 'gainst his shoulder.

"The dictionary ain't the only place to look for sympathy, Jean," sez he.

'Twas gettin' dusk, but it wan't too dark ter see—ef you was near enough—Jean's wet cheeks lookin' like pink roses in a thunder storm, and her pretty, tremblin' lips.

"Take away your arm, Carter," sez she, "an' leave the room this instant—how dare you kiss me!"

"Tisn't the first time," sez Don, "an' it won't be the last. What is the use o' puttin' on airs all the while, Jean? As ef we hadn't ben like brother an sister ever since we were born!"

"I wish you to understand that I have grown up, if you haven't," sez Jean, "an' I propose to be treated accordingly."

"She shan't be treated like a baby any more," sez Don, pullin' her handkerchief out o' her apron pocket and wipin' the tears off her cheeks. "There, now, she's a respected school ma'am an' everybody's 'fraid as death of her, an' I'll make a public apology to-morrow an' abase myself in the very dust."

"You're not comin' to-morrow," sez Jean, "you've ben expelled."

"I *am* comin'," sez Don, "as an example to the others. Where's your cloak an' hood?"

"Carter," sez Jean, "I do not wish for any o' your assistance. Be so good as to put my things down at once."

"O, *hang* Carter!" sez Don, gettin' out o' patience. "Why can't you speak to me like a man an' a brother? It's not in school hours at present!"

"Well, then, *Mr. Carter*," sez Jean, laughin' in spite o' herself. But she wouldn't let him help her put her cloak on, nor see her home.

She was dreadful mortified 'bout the whole thing whenever she thought of it, but it was a victory all the same.

Don came to school next mornin' as he said he should, but he behaved himself, an' you'd better believe he kep' the other boys straight, too! There'd never ben such order in that school in a winter term before.

An' so it went on till one night Don stopped ter ask Miss Jean if she'd go for a sleigh ride with him that evenin'. She looked up, pleased as could be.

"O, thank you, Carter," sez she. "I'll go with pleasure."

"Carter's not goin'," sez Don, lookin' at her kinder audacious, but she didn't take no notice.

Jean's mother didn't like her goin' with Donald a bit, an' she made a good many objections 'fore she let her start. But Jean had so little chance for pleasure, an' she knew she could trust her.

'Twas a real pleasant evenin'. The snow was deep on the ground, an' in the roads it was beat down firm and smooth as ice, an' the moon was shinin' 'cross the white hills. Long as she lived Jean could never see the moon shinin' 'cross the snow without thinkin' o' that night.

Don had a beautiful horse an' sleigh. His folks was well off an' he'd allus had things 'bout as he wanted 'em. He'd wrapped Jean up in the robes an' furs till she was as warm an' comfortable as ef 'twas summer, an' away they went, on an' on.

Jean was jest beginnin' ter think Don was uncommon quiet for him, when he turned round and begun rather sudden:

"Miss Jean, how far do you think a man ought ter obey his father an' mother?"

"Why—in everything, unless it was a matter of conscience," sez Jean.

"Of course, I know you'd go for discipline," sez Don, "but it *is* a matter of conscience. I'm goin' ter inlist. I came home for that, you know, only they were so against it I gave it up. But it's no use; I *must* go. There's ben a call for more volunteers. I should feel like a coward stayin' here at home."

"I'd go if I was a man," sez Jean, 'fore she thought, for she was a red hot little patriot herself, an' would a fought for her country in a minute ef she could a had the chance. But she dind't mean ter be counselin' him ter go 'gainst his father an' mother.

"I hate to make my mother miserable," Don went on, "but it isn't as ef they didn't have other sons. But, Jean, will you do me a favor 'fore I go? May I give you—a ring to remember me by?"

"A—ring?" says Jean, kinder surprised.

"Yes," sez Don. "Why not?"

"O, I couldn't!" sez Jean. "I can remember you without anything to help me, an' mother wouldn't like me ter keep it, or wear it; people would think—it was queer."

Don give his head a sort o' impatient shake. When folks wouldn't do as he wanted 'em to it allus made him more set 'n ever.

"Well, then," he sez, "I'll give you a ring your mother won't ob-

ject ter—as comin from a grateful pupil—an' nobody else 'll think anything 'bout it, either. You can laugh at it as much as you please, but you can't send it back; you won't know where ter find me, an' it will mean—jest what the other would have—” sorter catchin' his breath, an' goin' on fast, in a different kind o' voice from what Jean or any body else had ever heard sarsy Don Carter speak in a'fore.

“It'll mean I love you, always an' forever an' forever, an' I'll be thinkin' of you wherever I am. On the long marches through the day, by the camp fire at night, an' on the battle field—till a bullet leaves me lying there with my betters.”

“But you'll come back again safe, I know,” sez Jean. “You are just talkin' to make me pity you.”

“No,” sez Don, “I was only tellin' you what the ring would mean. If I come back you'll be the one to be pitied. I shall come straight to you wherever you are, an' I won't say by your leave or anything, I shall take you fast in my arms an' never let you go again as long as I live.”

Well, Jean she knew she ought to tell him he wouldn't be let to do nothin' o' the sort, but she couldn't help hearin' the kind o' shake his voice give over the happy picture, and she hadn't the heart.

She jest turned her head away an' looked at the moonlight on the snow, spreadin' out for miles an' miles. It had a dreadful lonesome look, somehow—an' she'd thought it was so pretty an' pleasant when they started.

“We ought to be goin' home, Don,” sez she. “I promised I wouldn't be late.”

An' then she was sorry she spoke, he answered so quick, as if he was hurt at her bein' in such a hurry.

“We are nearly home now, Miss Jean; our ride will soon be over. I don't doubt you'll take plenty more in the course of the winter, but it may be the last I'll ever have.”

Jean didn't say no more, and when they got home an' she was goin' ter say good night to him, he held out his hand.

“I shan't be in school to-morrow, Miss Jean,” sez he. “I leave my books to you, an' my seat to your next unruly scholar.”

He waited a minute for her to answer, but Jean didn't say anything; she was thinkin' how it 'twould seem to have some other boy in his place at school, an' him lyin' out on a battle field, as he'd said, his face turned up to the sky.

There was a lump in her throat so she couldn't speak, but Don, he thought 'twas cause she didn't care, so he jest give her hand a despairin' kind o' squeeze, and turned away.

I reckon 'twas the only time in his life that he lost anything through not havin' the sarse ter take it. But you see he'd offered the best he had, an' I guess he felt she'd kinder slighted it.

An' Jean, she stood and watched him out o' sight. 'Twas a dreadful onlucky thing ter do, but I spose she didn't think o' that. 'Twas one o' them quiet winter nights when there ain't a sound; an' when Jean couldn't hear the sleigh bells no longer for all her listenin', an'

she was left alone with the snow an' the moonlight, it seemed to her as ef all the world was dead an' buried.

But Don didn't forget to send the ring, and when Jean see what 'twas she didn't know whether to laugh or cry. But her mother was real pleased with it. She said she reckoned Donald thought he'd made extra trouble, an' wanted to kinder compensate.

But Jean, she knew well enough, what Don meant by it, an' when her mother handed it back to her she took it as ef she was half ashamed to touch it. Then she carried it to her room an' put it away. Course, comin' as it did, she had to keep it, but he needn't a ben afraid o' her sendin' it back, even ef she could have. Women are real queer 'bout some things, there ain't many men that understands 'em.

Well, I guess you think it takes me a long time to tell a story, but I've got to the end o' this one at last.

No, Don didn't ever come home. I reckon he must a had a pre-sentiment when he was talkin' to Jean that night. They said he made a splendid soldier, he had one promotion right arter another—till he got his last one from the enemy's guns.

I spose it must a been a comfort to his father an' mother that their wild boy died like a hero, but the old Deacon he wouldn't never own it. He'd ben 'posed to the war from the first.

An' so that was all the engagement ring Miss Jean ever had—not but what she had *chances* enough to a had one o' the reg'lar sort, but I reckon she thought they wouldn't none of 'em mean so much to her as that one did.

## STRISES FOR STRIKERS.

---

BY L. W. ROGERS, EDITOR AGE OF LABOR.

---

The very audacity with which a thing is done sometimes so obscures the public vision that an outrage is being tolerated before the people realize just what has occurred. This has been the case in nearly every great strike where the Pinkertons, conscious of their safety behind the bulwark of a great corporation's millions, have deliberately shot down defenseless strikers for the purpose of intimidating others, and been justified by packed juries before the people grasped the idea of the enormity of the crime committed. This has been the case where the laws of many a state have been deliberately violated to import armed bodies of men for the express purpose of overawing discontented labor and forcing it into submission. This

is the case now in the persecution of the Homestead Advisory Board by indicting them for treason, and in the very evident purpose to boldly twist the statutes of Pennsylvania far enough from their real intent to railroad the thirty-three men into the penitentiary. This charge of treason to the state is so groundless, the indictment so far-fetched, and the whole infamous concoction so brazenly bold, and the approval of the plutocratic press so fiendishly indifferent to every principle of common justice, that the people seem to stand aghast at this legal conspiracy against labor.

But it is not the treason cases I want to discuss. I have merely referred to them to better call attention to a fact which is forcing itself upon every thoughtful laboring man—the fact that the plutocratic capitalists in the United States have so entrenched themselves in the laws of the country, have so bribed and purchased courts and legislatures, that they control both civil and military authorities and are becoming bold and open in their movements for the subjugation of labor and the establishment of absolute wage slavery.

And this purchasing of law is going right merrily along while the people slumber. No sooner does some avenue to greater freedom open up before labor than it is promptly heralded by plutocracy's press and as promptly closed by plutocracy's hired minions. And so bold has the press become that there is no longer the slightest hesitation about demanding of congress or the state legislatures laws for strengthening the mastery of the ruling class, utterly regardless of the right or wrong involved. From the *Railway Review* I clip a paragraph which furnishes a case in point.

The *Review* comments at length upon the wild rumor that the switchmen will strike next summer during the World's Fair. The story is evidently doubted by that journal but it realizes that such a strike would be disastrous to the corporations and proposes to be on the safe side. It says:

But there is a remedy, and now is the time at which that remedy should be applied. Let congress pass a law, in the regulation of interstate commerce, requiring that thirty days' or other sufficient notice shall be given by both the railways and their employes of their intention to terminate existing relations, and making it a highly penal offense for any person or persons to wilfully and premeditatedly do any act, or omit to do any act, which it is their duty to do, in any manner impeding or interfering with interstate commerce. In other words, in so far as a railroad strike is a menace to the public and a source of damage to the people, make every striker amenable to penal legislation.

And so it has finally come to this, that congress is asked to make striking a criminal offense! And to "do any act" or to "omit to do any act" that shall be deemed in the line of "their duty to do," is to be made a "highly penal offense." In heaven's name, can infamy go farther than this without actually bringing out the rack and thumb-screw? Are not the corporations satisfied that when men ask for the same pay that other men get for doing the same work the militia can be called out to enforce the old wages? Have they so soon forgotten the utter helplessness of labor at Buffalo? Is it not a fact that five hundred switchmen, who asked for nothing but the hours established by law and the wages fixed by custom, were surrounded

by eight thousand soldiers and at the bayonet's point driven to submission?

But the corporate Shylock is not satisfied. The money is not enough. The last penny wrrenched from the hand of helpless toil does not appease the Shylock of 1892. There must be retribution, punishment, revenge. These men must be made submissive. They may strike again. Fear—fear of Shylock's revenge—must fill their souls. Slaves must fear or they are not slaves. The soldiers are good so far as they go, but congress can go farther. It can make striking a crime—a “highly penal offense.” Who will strike with the shadow of the penitentiary upon him? Would not the laborer rather pinch along sharing half starvation with his wife and children than leave them to starve altogether while he wore the penal stripes? Yes, if the corporations can but get a law to put a man in the penitentiary for striking, wages will rush downward until they reach the starvation limit and millions upon millions of dollars that now go to fairly paid labor will remain as profit in the hands of the corporations.

Let us look candidly at this proposition of the *Railway Review*. Instead of being dumbfounded at the depths of its infamy let us see just what this proposed law would do if enacted. It is given a semblance of fairness by requiring both employe and company to give “thirty day's notice” of any intention to “terminate existing relations.” This would be of little value to the employe who could not go to look for another place until the time came to leave his present one. But on the other hand it would render ineffectual any attempt to right wages by the strike, for with a short notice the company could assemble a force of scabs sufficient to “reorganize its service,” as was done in the famous Northwestern lockout. But even if the corporations could not promptly find a human being so distressingly impoverished and so contemptibly degraded as to take the places of their employes it would be of no consequence; for by the provisions of this law the employe must work thirty days or be held guilty of a “highly penal offense.” It does not matter what the company has done. It may have decided that the road is unprofitable and reduce wages one-half, but the employe who refused to work for thirty days is liable to punishment.

It may be that the company has decided to discharge its union engineers, one by one, and replace them with non-union men. Any firemen who should refuse to work with one of the scabs would be omitting to do an act “which it is their duty to do” and “interfering with interstate commerce.” Therefore he is guilty of a “penal offense,” and can be sent to the penitentiary. No matter what grievance an employe or class of employes may have it must be borne thirty days and then the only remedy is to quit and leave, for to strike means to wear the stripes of the convict and occupy the cell of the felon.

With a law such as that on the statute books the railroad men would be actual slaves and the corporations their absolute masters. Between the helplessness of the former and the grasping greed of the

latter there would be no barrier. The spirit of independence would be legally strangled. Wages would drop to the sum required to purchase existence and to his serf-like task every employe would be driven by the pitiless lash of hunger. Fear would dwell in every household and upon every cottage would fall the shadow of the penitentiary.

Rebellion against these conditions would be "anarchy," for they would be established by law. But the truth is that whoever threatens the liberty of the people is the real anarchist. The really dangerous classes of the United States are those who, with unlimited wealth and power, are legalizing every crime that they may rob by law, and asking congress to give them greater power for the people's subjugation. If those whose only weapon of defense is what we call the strike would not be caught in plutocracy's legal drag-net they must strengthen their ranks and look well to the issue. Almost every trade and occupation of the nation is far more solidly organized and better prepared for defense than are the railroad men. Unless something is done, and done speedily, to meet this advancing banditti of organized monopoly it is but a question of time when railroad labor will find that stripes for strikers have become lawful.

---

## SHORT STUDIES IN POLITICAL ECONOMY.

---

BY WILLIAM P. BORLAND.

### No. 1.

Political economy is generally represented as an exceedingly dry study; but it is not nearly so dry as it is represented to be, and when the student has once thoroughly entered into the study of the science he will find it of absorbing interest.

There is one circumstance which, more than any other, has given political economy the character of an inexact science, and detracted greatly from the force of its conclusions; it is that the science is restricted, in its use of terms, to words that have a variety of meanings in common use. It must speak of wealth, value, rent, interest, etc.; these terms are used in varying senses, in common speech, and the student, if he expects to derive any satisfaction from the study of the science, must clear these terms of all ambiguity; he must assign to each term a fixed and definite meaning, and use the term in that sense alone; even after he has assigned a fixed meaning to a term, if, in the course of his deductions, he allows himself to lapse into its common meaning he will find his conclusions of little value.

Nevertheless, workingmen, of all others, should cultivate this sci-

ence; they should be able to express clear and definite ideas as to their economic position in the social structure, and they will only be able to do this by cultivating a knowledge of political economy. Political economy is called "The Science of Wealth." Why, then, should not the wealth creators—workingmen—make it a study? I would like to see every labor organization in the land devote one or two meetings each month to the discussion of economic questions; it would broaden the views of individual members to a wonderful extent. It is the purpose of these papers to point out some of the pitfalls in the science, and awaken interest in its study in the minds of workingmen.

Let us begin with a definition of terms: Wealth. Here is a term that is surrounded with much ambiguity; many include all things having the slightest utility for man in the term, others define only those things which possess value as wealth, and there are economists who tell us in one sentence that value is wealth, and in another sentence that labor creates all wealth; which is the same thing as saying that labor creates all value. (We will attend to that when we come to consider value.) At present I want to call attention to that proposition: Labor creates all wealth. It is correct, and if it is kept in mind there need be no ambiguity connected with the term wealth. Just remember that those things which have been acted upon by human labor so as to fit them for the gratification of human wants are wealth, and none others, and you will not go far astray in your deductions. Those persons who include all natural forces, and all utilities of whatever nature, in the term wealth, are merely playing with language; it is impossible for them to arrive at conclusions which are consistent with their definition, as a perusal of their works will show. To a somewhat less extent, also, is this true of those who include all those things which possess exchange value as wealth. There are a great many things which possess exchange value that cannot properly be considered as wealth; a government bond possesses value in exchange, but it is not real wealth; so also do notes, stocks, mortgages, bank bills, bonds and other evidences of debt possess value, but none of these things are wealth, inasmuch as the increase or decrease of these things does not affect the sum of wealth in the slightest. They might all be destroyed without decreasing the wealth of a community by the value of a pin. These things represent, as between individuals or sets of individuals, the power of obtaining wealth already created. It is this power that invests them with value, and not that they possess any of the attributes of real wealth. They might all be destroyed without affecting the aggregate of wealth, because the wealth that would be lost by the owners of these things would be gained by those who were compelled to pay, and the sum of wealth in the country would remain as before. What is true of these things is, in like manner, true of franchises, lands and other natural opportunities; increase in the value of these things enables their owners to command more of the wealth which is existent, but what they gain those who must pay the increased value must lose, and the aggregate of wealth remains unaltered; and

again, now remember this: only such things are wealth the production of which increases and the destruction of which decreases the general sum of wealth. When we come to analyze this idea we shall find that, not only are all such things the product of human exertion, but they are really the only things which are included in the common understanding of wealth. When we speak of a community as having increased in wealth during a certain period, as when we say that New York is a wealthier state now than it was in 1870, we do not mean that there is more land or more people there than formerly; neither do we mean that there are more notes, mortgages, bank bills, etc.; we mean that there has been an increase in certain tangible things, having actual and not merely relative utility; we mean that there are more houses, ships, wagons, food clothing, furniture, machinery—in a word, we mean that there are more “goods” there than formerly.

The common character of all such things is that they consist of natural products or substances that have been adapted, by human labor, to human use. The destruction of such things is a destruction of wealth; their increase is an increase of wealth, and the community which, in proportion to its numbers, has the most of these things is the wealthiest community.

Thus wealth, as alone the term can be used in political economy, consists of natural products that have been moved, altered, separated, combined or in other ways modified by human exertions so as to fit them for the gratification of human wants. Nothing which nature supplies freely to man without his labor is nor can be wealth. Remember it.

[To be continued.]

---

## CONCERNING MONEY.

---

BY A. J. GRAY.

---

We are told by one school of reformers that the present maladjustment in the distribution of wealth, causing the impoverishment of the wealth producer, is caused by the monopoly of money.

They argue that if there was more money the rate of interest would be less, and if the rate of interest was less it would be easy for wealth producers to get capital with which to engage in productive industries.

Hence, they contend, an increase in the volume of money would cause the starting of new enterprises, the reviving of old ones, the employment of a greater number of laborers, an increase in wages, and make “times” much better for everybody. They affirm that

business stagnates because there is not money enough to carry it on. Money is not capital, it is not wealth, it is but a representative of value with which exchanges are facilitated. While money generally facilitates exchanges, it is not essential to the making of them. In fact, by far the greater number of business transactions are now carried on by a system of credits, through banks, and if the people, generally, were educated in the use of banks all the money in the United States, except the fractional currency, could be withdrawn from circulation without the least inconvenience to business. If each individual had credit at his bank for the cash value of his property the check book could take the place of the pocketbook and a system of drafts upon bank credits would take the place of money and credits of the bank, and at the bank, could be loaned and made just as available as money is at the present time. The volume of business transactions in this manner is steadily increasing.

Those who contend that the present depression is caused by the monopoly or scarcity of money can be likened unto one who, if the government should cause forty-four standard gallon measures to be made and one sent to each state to be used in measuring some commodity which it might require in payment of taxes, would contend that the production of that commodity was restricted because there were no more gallon measures provided by the government. If it was made unlawful to measure that commodity in any measure other than those provided by the government its production might be limited to the amount which could be so measured, and so might the amount of money issued limit the volume of business if it was made unlawful to make exchanges without using money, but in no other way could it materially limit the production or exchange of commodities. That we may produce and exchange, we are not obliged to have money, but we are obliged to have labor, and land, and, in most all modern methods of production, capital in some form is required, but all these can be obtained without money if we have credit.

If the volume of money was doubled it would not add a dollar to the wealth of the country, and it would not lessen the effort required to produce a bushel of wheat, a ton of coal, or any other commodity. Neither would the relative value of interest be changed for the value of money is determined by the relative effort required to obtain it, and were it increased to such an extent that it became easier to get, it would cheapen, or the value of labor products and land would appear to increase until the same amount of effort would be required to obtain them that was required before the volume of currency was increased. To illustrate, suppose before the increase in the volume of money a day's labor was worth a dollar, or a bushel of wheat or two hundred pounds of coal, or a square rod of land, and after the increase a day's labor would be worth two dollars, does any one pretend to say that the owners of wheat, coal, or land would then give for one half day's labor that which cost them the labor of a whole day? Or that the laborer could then get two bushels of wheat, four hundred pounds of coal, or two rods of land for a day's work?

L F M 3 JAN 36

It would then require an outlay of two dollars to purchase that which could have been purchased with one dollar before the amount of money was increased. The rate of interest would remain the same, but the amount of interest required to be paid on an investment in land or labor products would be doubled, because it would require twice as large a sum of money to make the investment. This is true because money is but a representative of value, a medium by the use of which we make exchanges. It is not the money which we want, but that for which the money will exchange, and the value of that is determined by the relative amount of effort required to obtain it. If the volume of money was increased to such an extent that it would be as easy to get two dollars as it now is to get one, and the amount of effort required to produce wealth remained the same, the value of money would decrease one-half and the amount of effort required to procure labor products, or land, would remain the same.

This would help only those who had contracted debts before the increase of money, and what it gave to them it would take from their creditors. The wealth of such men as Gould, Vanderbilt and Astor is not in money, so that it would be diminished by an increase in the volume of money, but it consists in those things which would be increased in value by the cheapening of money; and the purchasing power of the incomes of such plutocrats would not be diminished by an increase of money, neither would the conditions be changed under which a constantly increasing ratio of wealth productions flows into the hands of those who are not now able to consume a tithe of their incomes. The wealth produced is now divided between producers, landlords and capitalists, and should the volume of money be increased, the relative portion going to each would not be changed, hence, the wealth producer, the laborer, would not be benefited.

What the wealth producer wants is a change which will give him a relatively larger part of the wealth which he produces, measured by the amount of effort required to be put forth, and this we have seen, cannot be accomplished by increasing the volume of money to such an extent that it would be easier to obtain it, because the value of those things which labor needs in production would then increase until the amount of effort required to secure their use or co-operation in production, would be the same as it was originally.

If money could be used directly, in production, an increase in the amount of money would increase the production of wealth, but it cannot be so used.

Place money to the value of a locomotive before a train and it would not take the place of a locomotive to move the train; neither would money, to the value of a ton of coal, thrown in the fire-box, take the place of the coal in the generation of steam; neither would the wages of a fireman deposited in the cab take the place of a fireman. We ought to readily perceive that money can aid in production only as it is capable of being exchanged for that which can be directly applied to aid production. So, as before stated, it is not

the money which we need in production but those things which will help us produce; and as it is the amount of effort required to obtain those things which determines the amount which we can obtain, their money value is a matter of indifference.

This is not to say that the amount of interest required to be paid for the use of capital is a matter of indifference to producers. It only shows that *the amount of money in circulation* may be a matter of indifference, and that under present conditions an increase in the amount of money would not benefit the producer.

The share which producers are obliged to give for the use of capital depends upon that which capital can command invested in any way in which a valuable return can be had without the employment of labor, and as such a return can only be had by an investment in land, the increase in the value of which private ownership enables individuals to appropriate, the profit arising from investments in land must be the cause of interest, and determine the share of the product which capital can demand of labor for its use in production. Then the adoption of any policy which will make investments in land unprofitable, as investments, would materially diminish that part of wealth which now goes to capitalists, and at the same time it would reduce the part which now goes to landlords, thus it would have a two-fold operation in increasing the part which would go to the producer.

Such a policy is a tax on land values exclusive of improvements.

---

## YES, SCIENTIFIC TAXATION.

---

BY GEORGE C. WARD.

### No. 1.

I notice that in the November number of the MAGAZINE, there appears No. 1, of a series of articles from the pen of our mutual friend, Mr. W. P. Borland, under the same caption used by myself, to-wit: "Scientific Taxation," except that Mr. Borland adds an interrogation point.

Mr. Borland commences his article with the following paragraph:

I have perused the series of essays which have appeared in your valuable MAGAZINE under the above caption, with much interest. The articles are interesting, and, as illustrating the nonchalance with which a certain class of reasoners ignore well known economic laws, instructive.

To which I respond that "well known economic laws" very often prove to be mere bosh, as, for instance, the Gresham law, which states that cheap money will always drive dear money out of circu-

lation, which law France, for a number of years, has proved to be a fallacy. Many, who, in the past, have put their trust in "well known economic laws" have, in the end, been just as completely confounded as will be the single taxers when they try to realize their hopes for free trade and the single tax, as a result of Democratic legislation.

When 14 years of age I left home, a sailor boy, "to plow the ragging deep," and therefore, only obtained the rudiments of an English education, so that I am ashamed to admit that devoid as I am of technical scientific education, I do not understand many of Mr. Borland's scientific and abstruse phrases, as for instance:

In justice to Mr. Ward, it may be said his error lies almost wholly in the premise; so far as I have been able to discover, there is but one logical defect in his entire argument, and that consists in the material fallacy of reasoning "from a statement under a condition, to a statement simply."

But I have a faint glimmering of what he means when he says:

The error lies in the implied assumption that economic rent, as it at present exists, would be in no wise altered under the operation of the single tax; when the indisputable fact is that by reason of the destruction of the speculative margin, what is now termed economic rent, would in all cases be greatly reduced, and with respect to those cases upon which Mr. Ward reasons, it would, to a great extent, be entirely obliterated.

To which I answer that although single taxers are very fond of using the terms "speculative margin" and "economic rent," there are very few of them that have the most remote idea of what the terms really mean.

As for instance: There is no "speculative margin" attached to the *selling price* of a Kansas or Texas farm. The "speculative margin" is all such portion of the price asked for land, by land speculators, above such a price as the actual buyers, for use, are willing to pay. This may not be a scientific but it is a common sense definition. "Economic rent" is the legal, current rate of interest upon the actual, cash, selling price of the land. Single taxers need to master these rudimentary principles before they conclude that they experience no difficulty in discerning the illogical and worthless character of the figures which are paraded with such a show of exactness, and turn their attention to a refutation of the statement that "speculative margin" attaches only to land bought for speculative purposes, and is, in no sense, a part of the actual selling price of land bought for use and occupancy in a farming country, where every tract of land is for sale at some price. What people pay for land in such a country is the "natural price" consequent upon the pressure of population. The margin above what people are willing to pay is the "speculative margin." My figures must stand.

Mr. Borland says he will pay no more attention to this phase of the argument, but proceed at once to the more important one involving the three following contentions:

Economic rent is always expressed in price, and invariably falls on the consumer.

Economic rent is not created by the action of natural law; it is the result solely of non-occupying landlordism.

Being the result of artificial social conditions, economic rent may be abol-

ished by simply abolishing the conditions favorable to its existence, and by so using the taxing prerogative as to do away with non-occupying landlordism, it would entirely disappear.

He then expresses himself as follows:

Now, I think I have stated Mr. Ward's position as fairly as he could have done so himself; I must give him credit for presenting a highly ingenious argument, and one which must appear conclusive to those persons who fail to analyze it. In order to fully expose its weakness, it will be necessary to proceed in rather a roundabout manner, and approach the subject of rent through an analysis of price.

It would appear at first blush, as if Mr. Borland understood and had fairly stated my position, but upon reading further, I find that he does not understand me at all, because, 1st. He branches off into an argument concerning *production* and the *cost* of production. 2nd. He endeavors to spread me out all over God's green earth, in his effort to demolish my position.

It thus becomes necessary for me to explain, or rather call attention to the fact that in the article he is criticising, the language he criticises runs thusly:

My position is this: I claim that it is not individual land ownership, but non-occupying landlordism that is responsible for the existence of the factor, "economic rent." That non-occupying landlordism acts in the nature of a protective tariff in protecting occupying land owners in the absorption of "economic rent." That if "use and occupancy" were made a prerequisite to land ownership the natural law of competition would first wipe out "economic rent" and then cut down profit and interest, while the single tax would perpetuate rent by collecting it as a tax.

And this was the remedy offered:

A tax equal to the full rental valuation, or economic rent, should be levied upon land occupied for business purposes by others than those who own it.

There should be levied a cumulative graduated tax upon all unused and unoccupied lands. No other land should be taxed.

I supposed that any one would remember that land "occupied for business purposes" must be situated in cities and towns. And, as I do not propose to tax unoccupied lands in the country, at all, I tacitly admit that there is no economic rent inhering in occupied farm lands.

But I must insist on not only confining my language to cities, but also on confining the argument in each case, to each city for itself and by itself, and not in competition or comparison with any other city or cities.

And then I must insist on leaving out of the question any discussion as to production or its cost, relatively, in different locations. These terms "margin of production" and "natural price," are very foggy and but poorly understood, besides which, they have reference to a condition of affairs which have nothing to do with rent or the land question, but are the product of an idiotic and unscientific system of transportation. Apply the postal system to freight transportation, and all land will become of the same value, while the margin of production would be obliterated. At the end of any fiscal or calendar year, divide the gross receipts of the railroads, on account of

freight, by the number of tons freight handled, and charge the average rate thus found, for a hundred pounds of freight, whether it be hauled one mile or one thousand miles, and distance is at once annihilated as a factor in the cost of production, and differences in rent per acre must be the result solely, of different degrees of fertility. All lands will become of the same value providing they will produce as much an acre, and locality will not figure in the item of cost.

Mr. Marshall says: "The term price is economically qualified by the terms 'market' and 'natural.' In all forms of industry there is always a point where the price received for the product created is just barely sufficient to pay the necessary cost of its production, which necessary cost is wages when production is carried on by labor alone, and wages plus interest when labor and capital unite in production: the point where price just covers this necessary cost is the economic 'margin of production,' and the necessary cost at this point is what is termed 'natural price.'"

In a small pamphlet by Mr. Henry George, entitled "Taxing land Values," in the thread of an argument advanced to prove that the single tax could not be shifted by being added to the price of commodities, products, wares, etc., I find the following:

Not to multiply authorities, it will be sufficient to quote John Stuart Mill. He says, (section 2, chapter 3, book 5, "Principles of Political Economy"):

A tax on rent falls wholly on the landlord. There are no means by which he can shift the burden upon any one else. It does not affect the value of price of agricultural produce, for this is determined by the cost of production in the most unfavorable circumstances, and in those circumstances as we have so often demonstrated, no rent is paid. A tax on rent, therefore, has no effect other than its obvious one. It merely takes so much from the landlord and transfers it to the state.

Commenting upon the foregoing paragraph, Mr. George says:

The reason of this will be clear to everyone who has grasped the accepted theory of rent—that theory to which the name of Ricardo has been given, and which, as John Stuart Mill says has but to be understood to be proved. And it will be clear to every one who will consider a moment, even if he has never before thought of the cause and nature of rent. The rent of land represents a return to ownership over and above the return which is sufficient to induce use—it is a premium paid for permission to use.

It is of course very presumptuous in me to dare criticize one who, like Mr. Mill, is surrounded with a halo of economic wisdom and exalted upon a pedestal of fame. Perhaps I simply afford an illustration of the adage, "Fools rush in where angels fear to tread." I can't help it, however, for I either do not understand Mr. Mill's proposition, or else I take square issue with him. It is a pity that Mr. Mill did not define his proposition more clearly. Does he mean that the highest cost of production determines the price of products? If yes, then the landlord is not the sole receiver of "economic rent" in the case of land upon which the cost of production is less than the greatest. It is a commonly accepted theory that the price of products is determined by, or equal to the cheapest cost of production which would be the cost in the most favorable circumstances, or where the highest rent is paid.

I must humbly confess that to me it is not clear, but is all a muddle. Let me illustrate. The nearest approximation to free land in a city or town, would be the location suitable for business purposes, which could be obtained for the least rent. This would, at the best, be a poor business site, in the suburbs or outskirts of a city. The tenant or business exploiter upon such a location as this could but expect at the most, "a bare subsistence" from his business, after paying rent. Indeed, Mr. George's argument tends to prove that rent is all above a bare subsistence which can be made upon a tract of land. If, then, any business exploiters, merchants, bankers, professional men, etc., accumulate any wealth, after paying rent and receiving a subsistence or living, Mr. George is at fault and his rule will not hold good. Now it is a well-known fact that many business men and firms, professional men, bankers, loan brokers, saloonists, etc., pay heavy rents and yet manage to accumulate enormous fortunes. This would seem to prove: 1st. That "economic rent" did not absorb all "above the return which is sufficient to induce use." 2d. That "unearned increment" does not consist wholly of rent but partly of interest and profit. Now take agricultural lands. We will assume that the basis of computation, lands for which no rent is paid, will produce 20 bushels of corn to the acre. According to Mr. Mill, the labor necessary to cultivate an acre of ground or to produce 20 bushels of corn on free land determines the price of the entire corn crop. Let us examine this theory. We will introduce three more grades of land, producing respectively 30, 45 and 60 bushels of corn to the acre. Each grade is occupied by a tenant who pays one-third of the corn raised as rent. (This is customary rent.) Of course, it is understood that it takes no more labor to cultivate one acre of corn in one location than in another. Now, then, A raises 30 bushels, pays 10 bushels rent and has 20 bushels per acre left for his labor, or cost of producing the crop. He is upon an exact equality with the man occupying the free land. B raises 45 bushels to the acre, pays 15 bushels rent and has 30 bushels per acre left for his labor or cost of producing the crop. C raises 60 bushels to the acre, pays 20 bushels rent and has 40 bushels per acre left for his labor or cost of production. Now if the value of the labor of the man who tills the free land determines the price of the whole crop of corn, A gets normal wages, B gets 50 per cent. more than normal wages and C gets double normal wages. Either Mr. Mill is wrong or Mr. George is mistaken. If Mr. Mill is right, then B should pay five-ninths of his crop as rent, instead of one-third, while C should pay two-thirds instead of one-third. If Mr. George is right, then price is determined by cost of production under the most favorable circumstances, i. e., where the highest rent is paid.

It must be borne in mind, however, that this cost of production does not figure in a discussion concerning the rent of "valuable lands" in cities. Very little of such land is used for wealth production. They are nearly all used for wealth absorbing business. Interest and profit, and not labor, are the factors through the medium of which users of "valuable lands" in cities amass wealth. The more

interest and profit it is possible to absorb upon any given location or site, the more rental value attaches to such site, and the rent comes not out of the "exploiter" or business man, but is an indirect tax upon the whole people.

It would appear to me that very much of the sophistry and many of the fallacies, connected with what is known as the single tax argument, might be exposed and brushed away by the following simple statement, to-wit: The value and uses of land may be classed under three divisions, as follows:

- 1st. For residence purposes, and held vacant for speculation.
- 2d. For the production of wealth.
- 3d. For the absorption of wealth.

Land embraced in the first division is the only land the value of which can truthfully be said to be the direct result of the efforts of the community or people. The value of lands in the second class depends upon the success and profits attendant upon the production of wealth. The value of the land in the third division is dependent upon the success and profits attaching to the absorption of wealth. Like causes produce like effects. If private ownership of land enriches land owners at the expense of the residue of the people, then all land owners should be rich, especially those who owned good farms twenty years ago. If the economic and financial systems of the nation are just and equitable, tending to give to all equal rights and opportunities, and special privileges to none, then lands will increase in value in about the same proportionate rates, with the preponderance of increase, if any, in favor of land used for the production of wealth. If, on the other hand, class legislation of all kinds has resulted in special privileges to dwellers in cities and towns, while a wretched financial system and sharp commercial practices, cause high interest and abnormal profits, then business properties in cities and towns (single taxers' "valuable lands") will enormously increase in value, at the expense of agricultural lands. Taking a steadily increasing "rental value," or "economic rent" as a tax, will not remove the cause which results in enormous increase in the value of lands in cities and towns. Returning to the argument, we find that upon free land, the title is held by occupation, and not in fee simple by title deeds. The economic definition of the term "rent" is either the annual payment made for the use land, or the capitalization of such annual payment in the form of purchase money. Now, there are two factors which enter into the determination of advantageous and disadvantageous locations, or sites for agricultural purposes. These are relative fertility, or productiveness, and relative cost of transportation to market.

In the foregoing argument I took 20 bushels of corn per acre as the basis or unit of productiveness upon free land, and the labor necessary to cultivate an acre of ground as the unit of labor performed. Then taking the common, average rent of one-third of the crop as the unit of rent, I endeavored to show that A, who raised 30 bushels to the acre, made the same wages as the man upon free land. B, who raised fifty bushels to the acre, made fifty per cent. more wages than

did the occupier of free land, while C, raising 60 bushels per acre, made double the wages of our free land man. That is assuming that the cost, in labor, of raising an acre of corn upon free land, determined the price of the whole crop of corn.

Taking the factor of the cost of transportation, we arrive at the same results. For instance: Put our "free land" man on land that produces 40 bushels to the acre, but 400 miles from a good grain market. Then put three other men at stages of 100 miles apart, on 40-bushels-to-the-acre land each, paying one-third rent. It will be found that as we travel toward the market, each one of our tenants receives relatively higher wages for the cultivation of an acre of land, than did the man 100 miles further away from market; i. e., he produces corn more cheaply. Now, this may not prove Mr. Mill mistaken, but if it does not, it does prove that prices of products are determined, not by the lowest but by the highest cost of production. This explodes all commonly accepted theories and wipes out the argument that "bonanza" farms, by their cheapness of production, are driving the small farmer to the wall. It would also seem to prove that the science of rentals or landlordism is not yet fully developed in the United States, as it would appear as if the tenants received some portion of the "economic rent," which landlords are said to invariably absorb.

Now, returning to the three-fold contention Mr. Borland is trying to refute. Take an example: A occupies his own business site and makes a living, and a surplus income, through the medium of profit on goods sold. B is a tenant upon the adjoining business lot, and out of the same rate of profit realized by A, must pay his rent. I continue to assert that if both men occupied their own lots, competition between them would annihilate the margin now realized by A, as net income, and paid by B, as rent; that is, unless they entered into a trust and continued to charge as much for goods as before, both of them making the margin formerly only made by A. In other words, the non-occupying landlord acts in the nature of a protective tariff to the business man occupying the lot owned by himself. From the fact that both men, likely, buy of the same drummer, at the same price, all Mr. Borland's labored argument about price, falls of its own weight.

Mr. Borland whip-saws as follows:

It is a well understood economic maxim that the same article cannot sell for different prices in the same market. There is a portion of this product of ~~the~~ <sup>which</sup> that must sell for \$2; this leaves no margin whatever for rent, and this being the "natural price," sets the price of the whole product; hence it is impossible for rent to be expressed in price. Now, here is the fallacy: It is not the cost over the whole area of production that sets the price at the margin, but it is the cost of the margin that sets the price for the whole area. If rent were expressed in price, we should have this logical necessity: as rent increased so would price increase, and where rent was the highest there would price be the highest.

\* \* \* \* \*  
It will be noticed that in order to maintain his conclusion, Mr. Ward must advance the proposition: rent regulates price, etc., etc.

Not at all. Suppose Mr. Borland wrestles awhile with this propo-

sition: Rent is a part of, and is included in the price of all goods sold. Were there no landlords to pay rent to, price would be reduced in just the amount now paid as rent to landlords and absorbed as rent by those occupying their own land. Of course, I never meant that destroying non-occupying landlordism in Chicago would abolish rent in Kansas City, but I do assert that it would disappear in Chicago and in Kansas City, were non-occupying landlordism abolished in both cities. Mr. Borland has not only not demolished, but he has not even touched my arguments.

[To be continued.]

## THE COMING CIVILIZATION.

BY JOSÉ GROS.

No. 1.

When we study the general conditions of modern nations, we can hardly doubt that they are in search of some new departure for future developments. We refer to the working masses and to the thinking men and women among the classes more or less at ease. We don't refer to the bulk of the classes at ease. They are still essentially retrograde. They have always been so. We are willing to acknowledge that we have to-day a larger proportion, in those classes, willing and anxious to work along fundamental lines for the upheaval of humanity. We can go no farther than that. The bulk of the well-to-do are still in the rear, taking care of the baggage in the march of civilization, delaying that march as much as possible, constantly creating alarms about supposed attacks in the rear, so that some of the timid advancing forces may fall back to protect that rear and thus weaken the vanguard and its supporting columns.

Now, who are the timid advancing forces and those willing to advance but afraid of it, playing in the hands of the fellows in the rear? They belong to all classes, more or less, from top to bottom in the social structure. But, suppose for a moment that the timid in the upper and lower middle ranks should stop being timid and thus become brave. How long would the ranks below remain timid? Not very long, it seems to me.

For over forty years the writer has had the opportunity of studying on both sides of the Atlantic, the general tendencies of the upper and lower middle classes, including, in the latter, what we may call the pinched and genteel middle classes, often more pinched than the <sup>best</sup> classes in the labor ranks, farmers and wage earners. The pinched and genteel middle classes are often very amusing. Having received a choice education they may possess the aristocratic passion; they may live in aristocratic dreams, always and forever struggling to <sup>be</sup> the aristocrat. It is not altogether their fault. It is also due to that choice education, choice in ornamentals but far from choice in fundamentals, because unsymmetrical and incomplete.

That general timidity, peculiar to all the middle classes, the pinched one, the genteel one, and the one more or less at ease, that timidity must necessarily radiate from that incomplete education so full in ornamentals and so lacking in fundamentals. This seems to be corroborated by what we can notice when we come in contact with the very men and women who, although belonging to such middle classes, have come out as brave reformers in the cause of humanity. Such men and women have generally left behind them the petrified thoughts of their own class, and have decided to think with their own minds, so to speak, to think by themselves, regardless of all class prejudice, eliminating all traditional thoughts resting on narrow conceptions, on petty fears of class antagonisms, on all mean aspirations of aristocratic exclusivism. Such men and women are trying to educate themselves in fundamentals, trying to broaden their sympathies so that to embrace all classes of men in their general views of life.

We all know that Christ exhorted his followers to strive for a new birth. He evidently meant new thoughts, new principles, emotions large and holy, far transcending the petrified thoughts, principles and emotions of that day. We all need a new birth to-day just as much as the men nineteen centuries ago. We all need to rise above the emotions, principles and thoughts petrified by human selfishness, by that narrow class esteem which so dwindles all our tendencies, all our feelings, all our faculties! Yes, from the best educated man and woman down to the most ignorant one; from the fellow with millions of dollars income down to the one with \$2 daily wages or even less; we all need to be born again, we all need to be rocked in the cradle of sound fundamental thoughts embodying universal love, love towards all men, love towards all truth.

Most people will tell you that they love all men and all truth; but you try to enter into a conversation with them, dealing on any of the problems of the day, and it will not be long before you discover that they love but a certain group of men and this or that truth. That that should happen with the struggling classes of society with limited education and poor surroundings is natural and inevitable. But that happens with the bulk of those who have received what we call a good education, with those who live more or less at ease or are constantly hanging around them and crave to form part and parcel of the well-to-do in the high ranks of society. Outside of a small percentage all such people are afraid of a radical improvement embracing the working masses in all human industries. They dread a leveling down, on their part, if the millions below rise too much. Would they dread any leveling down process if they really loved the classes below? Would they even imagine the possibility of any such leveling down if they really loved all God's truth?

When we do love all men and all truth, we are then afraid of nothing in the realm of human progress. We then see the grand solidarity of all truth as we then see the grand solidarity of all men! How could the latter exist without the former? And how could God exist without the two? If all truth comes from God, if all beauty in the physical and moral order radiates from Him, then, how can any

one truth be at war with any other, or how can we have any unsymmetrical developments in the physical or moral order as permanent factors established by God Himself?

No wonder that even many men and women packed full with good intentions are timid about this or that fundamental reform and doubt that any grand results may be brought about through this or that process. They have not yet conceived of a symmetrical Power at the helm of the universe. That is the trouble with them. Hence that education of ours, lacking in fundamentals and permeating yet the bulk of the best classes, or those who by rights should be the best because of greater facilities all through life and less abnormal surroundings than the masses below, hence the scanty number of fundamental reformers as yet. But we should not be discouraged on that account. Ours is the first historical period which has enjoyed the privilege of containing a constantly growing group of such radical reformers, indicating a new departure in the march of civilization. Ours is the first period in the whole history of humanity when numbers of labor papers have been seen, edited with the greatest intelligence of the age, proclaiming the noblest conceptions that have ever been embodied in human language. That is enough to begin with. The rest shall inexorably follow, even if slowly and painfully.

What we all should remember, in the glorious struggles before us, is that strength depends on solid conceptions of life, and therefore on solid conceptions of God, solid because representing high divine ideals to be realized just as soon as men do their best to accomplish what is right for all.

The sluggish civilizations of the past and the present have been the result of human inertia, not of divine inertia, as they have always been trying to teach us. What can we expect of men who, when pressed hard in the solution of human problems, directly or indirectly assume that such and such achievements are too much for us to expect because of the many who shall never be up to the required standards in life? That idea alone destroys all their initial force and builds up that inertia which has so far prevented any radical advances. That alone establishes two groups of men totally apart from each other, one in close contact with God, and the other at war with Him. No solidarity of humanity, and hence no solidarity of God's laws! No symmetry between the physical and the moral world! No principles of general ethics with which to normalize the conditions of all men! No inexorable sequence between healthy physical conditions and healthy spiritual developments! A God of anarchy in the moral order, yonder, in the infinite—not a God of order among men as He is a God of order in the cosmos!

Now let us ask to ourselves the following question: Why have some men forever insisted upon making us believe that the grand sodality of God's universe is a mixture of grand symphonies on one side and great anarchies on the other, for some time, anyhow? Because, if we don't believe that, then we plain people shall set thinking with our own minds, taking nothing for granted from the men above, and we shall then rectify civilization regardless of the fancies

of any set of men. And that thinking process has already commenced! And that rectification may commence before long!

Suppose that now we let our minds rest for a few seconds on the following sublime sentence: "He that believeth on me the works that I do shall he do also, and greater works than these shall he do; because I go into my Father." Men are then promised the power of performing even greater works than the One who was always tender and lovely towards the poor and the oppressed; the One who was only harsh towards the top men controlling the civilization and thoughts of the day, and the very fellows whom Christ evidently considered as the cause of all social iniquities. He could not then refer to those magnates when He promised to men the potentiality of doing greater works than Himself. He referred to the working masses of humanity, to the ones who alone make civilization possible. But, what kind of works can those be, greater than Christ's works? It seems to me that that can only refer to the undertaking of establishing civilization on principles of righteousness, something that the top men have never done, although they have certainly controlled all the civilizations we know something about. Can anybody give us any better suggestion on the subject?

And now think of the finishing touch in that glorious sentence we have mentioned, viz: Because I go into my Father. That seems to mean: I go back into the infinite, back at the helm of the universe, there to see that you men have a gorgeous and rectified civilization, just as soon as you work for it, just as rapidly as you realize the absolute symmetry of my universe and the unbroken symphony of all my laws.

Yes, we can have a correct civilization if we work for it under the impulse of high ideals, always guided by the harmonies of God's truth and the melodies of divine love.

## EPISODES OF 1848.

---

BY MARIE LOUISE.

No. 1.

On the 23d of February, 1848, in Paris, a fierce insurrection had raged during two days. Late in the afternoon news spread all over the capital that King Louis-Phillippe had dismissed the Guizot ministry and summoned Molé to give him the portfolio. Hope was entertained that the revolution was over, and the inhabitants of Paris prepared for a grand illumination.

At six o'clock a large crowd collected in front of a house in the rue Bourg l'Abbé. In the court yard fifty Municipal Guards (a kind of police-soldier) had been shut up to protect the warehouses of the

gunsmith Lepage. The Municipal Guard was specially hostile to the people, and during the insurrection they had behaved in a brutal and even savage manner toward the insurgents.

On beholding these guards, who had acted with so much cruelty, the people began yelling in an ominous way and shouting, "Let them be disarmed!"

Some National Guards came and occupied the doorway to check the rush of the mob against the feeble gate. The yells and shouts of the crowd became terrific, and National Guards ran from all points to reinforce their companions who guarded the doorway. The mob, swelling from the rear, brought the front to press heavily on the frail gate—the only protection of the unfortunate Municipal Guards.

At that time a tall, strong man, his face all black with powder smoke and carrying a musket, rushed out of the crowd and ran towards the rue St. Denis, where a detachment of National Guards occupied the corner of the rue Bourg l'Abbé. Approaching one of the guards, a short, robust looking man, he whispered:—

"Etienne, come with me in all haste; the fifty Municipal Guards at Page's are going to be massacred by the populace; let us save them."

"They deserve to be massacred, Arnold," replied Etienne, "Since two days they have committed all imaginable brutalities, and always on unarmed men."

"I know it, Arago, but let us prevent the people from doing the same horrible deeds; let justice be tempered by mercy," replied Arnold with emotion, whilst tears danced in his eyes.

"I understand, Arnold," replied Etienne Arago, "let us hasten."

"Unbutton your coat, Etienne, and let your cross of July be seen," said Arnold, "the people will give way before that magic sign."

In two or three minutes they reached the scene of the tumult. The National Guards were giving way under the furious onslaught of the populace, and the cooped up Municipal Guards seemed doomed. "Vengeance! vengeance!" roared the mob, waxing more and more frantic as they longer and longer gazed on the hated guards.

Etienne Arago, the brother of the great astronomer of that name, rushed to the door of the fatal house. His name sounded all around and the paroxysm of fury in the throng around him abated perceptibly. He entered the court yard where were also a captain of the National Guard and the Mayor of the sixth arrondissement and a few National Guards.

"A long half-hour passed away, during which E. Arago, sometimes addressing himself to the National Guards, sometimes to the irritated crowd, endeavored to make an appeal to these sentiments of generosity which never lie dormant in the hearts of Frenchmen," says Mr. Percy B. St. John in his *History of the Revolution of 1848*. "At length he obtained pardon for the condemned Municipal Guards; but the people, become judge and sovereign master, imperiously demanded that their vanquished adversaries should retire unarmed, with their heads bare.

"The door having been opened, E. Arago announced to the soldiers the will of the people. The most part hesitated, that thought

their death inevitable; they wished to retain their arms and to die in combat. Their resistance was, at length, conquered by a formal engagement given them by E. Arago and some National Guards who were present, who promised to protect them from the vengeance of the crowd. The detachment was then ranged close by the door of the house.

"Hats off!" cried the crowd on seeing them march along conducted by National Guards.

"Hats off!" repeated Arago, addressing the prisoners.

"The Municipal Guards seemed to hesitate.

"Hats off before the people," again cried E. Arago in a louder voice, "Today, it is the people who command!"

"Officers and soldiers uncovered themselves. A small detachment of cuirassiers who happened by chance to arrive, helped to open the passage for them. The Municipal Guards defiled in single order. Lieutenant Bouvier, who was the last, took the arm of E. Arago. Several National Guards and other citizens marched at the side of the disarmed soldiers. A small number of troops of the line also assisted toward their protection.

"However, at the sight of those men who had scattered so many victims round them, the rage of the people was renewed. In the narrow streets which they traversed, the blouses of the workmen rubbed against the clothes of those men stained with the blood of the martyrs. The contact revived the hatred against them, and, as they passed along, pale and trembling, they received many blows, and thousands of cries were raised, both against them and against M. Arago, their defender.

"They have killed our brothers; let us have vengeance on them!"

"I have promised to save them," replied E. Arago, calmly and collectedly, "and I will save them, or you shall kill me first."

"But are you, then, their friend? Have you also shed the blood of the people?"

"The only answer which Arago made was to mention his name and show his cross of July on which the people who were near ceased from their menaces; but those who stood at a distance still continued their cries of vengeance, and there was some danger that the gallant defender of the Municipal Guards would be sacrificed without being able to save those for whom he risked his life.

"The party walked slowly along the rue Bourg l'Abbé, the rue aux Ours, a portion of the rue Rambuteau, the Marché des Innocents, the rue St. Denis, until the Place du Châtelet where they arrived on the Quay.

"Throw the wretches into the water!" cried the crowd in the most furious accents.

"Lieutenant Bouvier drew close to E. Arago and said to him in a voice of despair,

"To die! to die torn to pieces! And my brother has fallen this same year in Africa. I have a wife and children!"

"Take courage!" answered E. Arago, holding him firmly by the arm, "before they can touch you, they first must kill me!"

"An hour passed away which appeared an age, when by a clever manœuvre of the cavalry the crowd was driven off of the Quay, and Municipal Guards arrived at the Hotel de Ville, which was defended by troops of all kinds.

"They here pressed round E. Arago, and expressed their warmest gratitude for so nobly saving them from the fury of the people.

"Yes," exclaimed the brother of the illustrious astronomer, "I have saved you, but recollect well that you owe your lives to a Republican. To-morrow, perhaps even this evening, the combat will continue in the streets. I count on your honor that you will not again be found in arms against your brothers!"

\* \* \* \* \*

When Etienne Arago left the Hotel de Ville he met Arnold de Verchères on the steps waiting for him.

"Success has crowned our undertaking, Arnold," he said, "but our lives have been in danger several times. As you marched behind me the sound of your footsteps gave me faith and courage to brave that immense danger and terrible responsibility—for, Arnold, had you and I perished in this affair, two lives valuable to the Revolution would have been destroyed and in the great combat which must take place in the streets to-morrow our absence would have been felt. It is a question whether the lives of these fifty Municipal Guards would, in the present struggle, compensate for the loss of our own. To-day Liberty can spare none of her sons, for the combat is decisive. Fifty more soldiers on the side of tyranny and two less on the side of freedom, makes a net difference of one hundred and four in favor of despotism."

"What you say is true, Etienne," replied Arnold, "but how sweet it is to save human lives—to snatch individuals from the hands of a powerful mob—whatsoever mob it may be! Our death might have been detrimental to the success of French liberties, but it would have paved part of the rugged road to the universal brotherhood of men."

Etienne pressed the hand of Arnold de Verchères and said, "This is a lovely dream, comrade, but hark! . . . the fusillade which just now reverberates and shakes the welkin is no dream! Let us run to succour our brothers!"

"The fusillade is in the direction of the Boulevard de la Madeleine," said Arnold.

"I think it is," replied Etienne, listening breathlessly in expectation of another discharge—"Have you plenty of powder and bullets, Arnold?"

"Yes, I have," answered Arnold, "I took a fresh supply just a few minutes before I was told about the fifty Municipal Guards being in the hands of the people."

"Good!" said Etienne, "I am also well provided. Now let us run to the Boulevards—there is trouble over there—I feel it. Arnold,—one—two—three,—*allons au pas de charge.*"

In a few minutes they reached the Boulevards by the rue Montmartre, and lo! as far as their eyes could reach, a terrible scene was enacted there! Thousands of men, women and children were flying

in all directions, shrieking, bawling, cursing, raving! A squadron of cuirassiers were charging the crowd, sword in hand, trampling over a hundred bodies on the ground, lying weltering in their blood.

"This is serious work!" said Etienne, "it is a massacre—the people are all unarmed!"

"They all thought the revolution ended," rejoined Arnold, "see! all the houses are illuminated. The people trusted Louis Phillippe and his new ministry."

"Fools!—fools!" growled Etienne between his clenched teeth, "the people are fools!"

Just then a man, bareheaded, ran frantically down the Boulevards shouting, "To arms! we are betrayed!"

"What has happened?" asked Etienne Arago, stopping the man in his mad flight.

"The troops have fired on the unarmed crowd," replied the man, pointing towards the bodies scattered on the road, "and the cuirassiers have charged, sword in hand, trampling under the horses' feet the dead and wounded!"

"How did the soldiers happen to fire?" again queried Etienne Arago.

"We all thought the revolution was over and we were rejoicing. A column of students, without arms, turned the Boulevard singing, *Mourir pour la patrie*, and instantly the troops levelled their muskets and fired on the unarmed people. My hat was carried off by a bullet. Vengeance!—To arms!" the man shouted as he resumed his wild speed down the Boulevards to carry the news of the massacre.

"The effect was electric," says Mr. St. John in his history, "each man shook his neighbor by the hand, and far and wide the word was given that the whole system must fall."

"The revolution ended!" exclaimed Etienne, with a strange, guttural laugh, and shrugging his shoulders as none but a Frenchman, and especially a southern Frenchman, can do, "why, the revolution is only just begun! To-day and yesterday we have done but skirmishing work. The middle class was all in it. They fought to kick down Guizot and Duchatel. It is done. Now we will fight to kick down Monarchy. It will be done. The Faubourgs must rise to-morrow. Let St. Antoine's flood roll its foaming waves to the Place de la Bastille, and all Paris is deluged! Arnold, let us get a truck, and lay on it as many of these corpses as we can get. With that ghastly load we will traverse the Faubourgs and arouse their anger—the lion's anger!"

A truck was hastily procured and seventeen unclaimed bodies were placed on it. Drawn by eager hands the truck, preceded by a red flag and escorted by hundreds of mourners, descended the Boulevards, traversed the Place de la Bastille, and ascended the Faubourg St. Antoine. Every minute added hundreds of new mourners round the cortege.

On, on, and onwards, moved the dense mass of humanity, growing denser and denser at every step! Sobs, moans, groans and cries of vengeance rose and spread in the air as a herald of the lugubrious

procession, whilst spots of blood on the pavement told where it had passed. Merchants, clerks, artisans, came out of their houses with arms and joined the procession!

Onward and forward rolls the living mass, now become a human sea, waving and roaring and gushing, as it curves on the Place du trône and flows leftwards on the Boulevard Extérieur; advancing with its burden of bleeding and ghastly corpses made still ghastlier by the lurid and flickering light of torches!

The human tide has reached the Faubourg du Temple and Belleville; its arms are thrown towards the Faubourgs Montmartre and Poissonnière, and soon the entire Boulevard de ceinture (belt) is deluged! Paris is girded by the Revolution!!

The hideous funeral pile was then drawn to the center of Paris. On their way they halted at the office of the *Reforme*, the Republican paper. Ferdinand Flocon, the editor, came out and addressed the crowd, promising that justice would be done. The people replied, "To arms!"

The dismal cortege then pulled to the office of the *National* and called for the editor. Armand Marrast was too moved to speak, but Garnier Pages assured the crowd that justice would be done. A boy near the truck on which the dead lay, put his fingers in a gaping wound and holding them up to heaven, he cries—

"See them! I swear to wash away the stains only when they are avenged!"

Before midnight the tocsin was sounding from the top of the building of the *National*.

On the next morning the sun rose on barricades bristling all over Paris. Over two thousand of them had been erected during the night. The red flag waved on each.

A general in full uniform commanding a column of about ten thousand men of the people issued from the Faubourg St. Antoine on the Place de la Bastille, and marched down to the Hotel de Ville, which they attacked. After an obstinate contest the Hotel de Ville (the legislative hall of the revolution) was captured by the people. The officer who had thus carried that most important position was Gen. Pyat, an old soldier of the republic and the empire, who bravely risked his life on the battle field, or, if defeated, on the scaffold. But he ignored all, except his hatred for tyranny and his love for the people.

At five o'clock in the morning informations had been brought to the King that people and National Guards all were flying to arms. The first result of this was the appointment of Gen. Bugeau (a man noted for his bloody repressions in Africa) as commander of the National Guard. But as report upon report arrived,—the people are surging from all the Faubourgs; the insurrection becomes tremendous; the rations have not been distributed to the troops and the people share their crusts with the half starved soldiers; the market women bring them food; the officers cannot rely on their men,—the affrighted King had sent for Thiers and Odillon Barrot to form a liberal ministry.

But the time for concessions was past. Louis Phillippe had awakened too late to the folly of his obstinate refusal to grant electoral reforms. Now the people, fighting behind their barricades on which floated the red flag, were crying, "Vive la Republique!"

Practically, Louis Phillippe had ceased to rule over France.

As the day advanced the troops and National Guards had fraternized with the people nearly everywhere. Early in the morning the force of the insurrection appeared so tremendous that the soldiers soon realized their critical position. The people—systematically distributed on all points—were well organized. No less than twenty thousand men belonging to secret societies, it is estimated, acted as leaders to that vast army of insurgents.

---

## THE UNION MAN IN POLITICS.

---

BY JOSEPH R. BUCHANAN, LABOR EDITOR, AMERICAN PRESS ASSOCIATION.

---

Now that the quadrennial contest in the political arena is concluded, and the free American citizen has recorded his choice of two evils, now that we can leave the affairs of the nation in the hands of those who believe that public office is a private snap, I want to ask the wage-working readers of the MAGAZINE a few questions.

To touch, ever so daintily, upon these things at any time between the nomination of candidates and election day, lays one open to a flaying by the trades unionist, who will have no "interference with his political rights." He will stand it after the election, not before. Strange, isn't it, that a man will take a thumping for doing a thing when the same man would not have tolerated the weight of a finger in caution, before the thing was done? It is like the dog who will fight viciously in defense of the piece of meat he has stolen and is about to devour, but will tuck his tail and slink away at the sight of a switch after he has swallowed the purloined sirloin.

But to my questions. My good friend, do you feel that you have been or will be benefited by the result of the recent election? No juggling now—tote fair—you needn't answer aloud. Keep your seat and mentally look the question square in the face and see if you can find the slightest support for an affirmative reply. I know you cannot, and that's why I don't want you to waste time in hemming and hawing in search for an excuse. An apology is not wanted.

Do you not know that if you and all, who, like you and I, are

wage workers, had been true to the principles laid down in the policy of the great labor movement, of which we are a part, the answer would have been easy and straightforward? Yes, had you voted, as you declare in your "principles" and resolutions, and as you talk when you hear the rumble of mammon's chariot, you could answer that another step towards the emancipation of the white slaves had been taken. Do not attempt to quiet the voice of conscience by saying, "my principles—the principles of the labor movement—were not clearly represented in the late election." Whose fault was it that they were not? You are not in the habit of passing the dish of buzzard put before you by the bosses of the old parties, because it isn't cooked and garnished just as it should be. What right have you to be so con-foundedly fastidious?

I know the old cry of "non-political trades unions." I have heard it until my ears ached, and my heart, too. But you are everlastingly asking for things which can be granted only through legislation, and what under Heaven is that, if not political? The trouble is, too many men in the unions think that politics means candidates instead of "the science of government," as the lexicographers tell us. Those things which unionism desire through legislation—and they are the important things—cannot be obtained until they become a part of the policy of the party in power, and such a party will never be in power until the wage workers unite and place it there. These are truths as plain as a pikestaff, and yet the union men of this country go on declaring, demanding and resolving in the air, while the power to settle the whole thing quickly and effectually, slips through their fingers under the fascination of the old party tom tom. To paraphrase John Hay: You may resolute till the cows come home, but if you don't get sense and courage enough to vote accordingly, you may "ras-tle your hash" in chains.

No offense intended, but don't you think it is about time you did your duty by yourself, your children and your country?

---

### PLANT A HOME.

---

Young beginners in life's morning,  
Don't forget the rainy day;  
Sunshine cannot last forever,  
Or the heart be always gay.  
Save the dime and then the dollar;  
Lay up something as you roam—  
Choose some blooming spot of beauty,  
Some fair lot, and "plant a home."

You, too, who have babes around you,  
Coming up to take your place;  
Give them something to remember,  
Homestead memories let them trace.  
Would you feel the pride of manhood,  
Let the sun your dwelling greet,  
Breathe the blessed air of freedom,  
Own the soil beneath your feet.

You, too, who perhaps have squandered  
Life's fair morn—'tis not too late!  
Start at once to woo bright Fortune,  
Rail no more at so-called Fate.  
Sow the golden seeds of saving  
In the rich and quickening loam,  
Spend your last days not with strangers,  
Enter Heaven's gate from home.

# MECHANICAL.

---

## WITH THE NEW YEAR.

---

BY THOMAS PRAY, JR., AUTHOR OF "TWENTY YEARS WITH THE INDICATOR."

---

The Editor of the LOCOMOTIVE FIREMEN'S MAGAZINE is in some respects as uneasy as the traditional flea, but he does not jump so far nor so erratically; he is now at another idea, and has in his persuasive and convincing way asked the writer of this to start an "idea sprouter" for the "boys," young and old. How to do this is a conundrum to him, and a puzzle to the writer.

It is easy to go ahead and write on any of the old, threadbare, and much written on topics, but they are always interesting no matter if some of them are stale, for the realm is not endless, but when you ask to write on "what the boys want to know," where does it begin? what does it comprise? and where will it end? These "boys," the writer has had some little contact with, and he knows what they want in some respects, and what he does not know as to their wants, is much more than what he does.

Men who have some ambition to get off of the footboard will find a way, and the "old man" who occasionally calls you up on "the carpet" is on the lookout all the time for the class of "discontented" fellows who are not constitutional kickers, but who are all the time uneasy, and looking higher up; this is the reason why we come into contact with the "boys who have climbed" just off the foot-board, and into some other place, and it is in most cases just such fellows who are the most troublesome, not to their detriment, but because they are not willing to carry a dinner pail all their life if they can stow away what is worth cash in their "brain tank" so as to get upstairs.

What a man wills he can be if he has stick-to-it-iveness, and if it were not for that class of men, we would be behind in our improvements; and such men are, as one of our comic writers has so quaintly put it, "the pepper sass" of creation, or men who stir up their friends and neighbors to higher impulses and nobler deeds.

How to do this, is the question that your friend and editor asks; what way is to be followed is not clear to either of us, and as it is a

mutual matter as between the reader and the editor, it seems to the writer that the only way is to open the whole matter to the readers for some expression of opinion, and then to follow the suggestions of the larger number; what may in that line meet with his approval will without any doubt be for the best interests of the greatest numbers.

It has occurred to the writer that it may be a good plan to open a question box, all to be sent to the editor, and such as are of general interest to be taken up and replied to for the benefit of the readers at large. If this is done, it will open to the whole number of the readers of the LOCOMOTIVE FIREMEN'S MAGAZINE a range of inquiry that is only limited by the amount of information that is or may be wanted, and it may not be possible to fulfill the contract, but if it is undertaken, we will try to do as much as can be done.

There are so many different ways to get at a matter and such a difference in the various authorities, that it may at times, and probably will be, difficult to fill the bill, but there is nothing lost in trying. The problems that different men want to solve are as varied almost as the men who are trying to solve them, but there are so many matters of common interest that it seems to be feasible to make it not only interesting, but profitable, to at least consider the way in which we are doing, and the possibilities of some other way of doing the same thing to attain the same result.

The writer trusts that if this shall meet with the full approval of our friend, the editor, that the readers will take up such things as they would like to know of, in the line of how to become more efficient, and how to do those things which are of the most general interest and likely to be of advantage to their work, and the ways of doing it.

The way to do a thing, and the best possible way, are at times far apart, and in kindly conference with each other, in comparison of notes, of experience, and considerately in all respects, with each other, is likely to be of more than passing interest and benefit.

To do this with best results, will call for time and care in getting replies, and will very likely lead to more of notice and consideration than may at first seem possible, but if entered into earnestly, then we are all to get well paid for time spent, for what a man or boy learns, if only good, is not to be taken from him.

The progress in mechanics has in many instances been from some suggestion made on the spur of the moment by some one not perhaps very well acquainted with all the conditions, and afterwards taken up seriously and worked out, to the great advantage of those in the consideration of the points at issue.

Why, then, cannot the readers take into consideration what is to be done for all, and then go at the doing of the job, and in their usual good style?

All of which is submitted to the audience, with the personal best wishes of the writer to each and all, in hope that '93 may bring to each one that tries, many and happy returns of profit on the investment.

## PRACTICAL TALKS TO YOUNG ENGINEERS.

BY L. B. MOORE.

### No. 1.

I sympathize with the engineer who has just been promoted; he stands upon the threshold of a new life, crowded with new responsibilities. For years he has looked forward to the time when he would change to the right side of the engine, and now the hope of years has met its fruition in the attainment of his desires.

I sympathize with him because of the many obstacles with which he will have to contend in the line of his duty. As good service is expected of him as from the more experienced engineer, and any infraction of the rules, or error in judgment that would endanger life or property causes discipline to be meted out to him as freely as though he had the experience of years.

It is true that he receives a less rate of pay on account of his apprenticeship, and which the management of railroads say is to partially defray the expenses of his education, damages to property, etc., but it makes no difference who it is, or what is the disparity in conditions, the consequences are the same.

In the light of my experience, and my observations of the failure of many young engineers, I desire to express my views for the possible benefit of those readers of the MAGAZINE who aspire to the successful management of the locomotive.

It may seem to many of you that I am dealing, to a considerable extent, in homilies, and that you have advanced further than the elementary principles of locomotive practice; but experience confirms me in the belief that special attention should be given to practical running rather than technical matters pertaining to locomotive construction.

After leaving yard service, the young engineer is confronted with the hardest experience in the service—that of an extra runner on extra trains.

Not only is his work made more severe, and taxing to his patience and judgment from being compelled to run a different engine under different conditions each trip, but his responsibility is immeasurably greater than that of one who, having the benefit of experience, is given a regular engine on a scheduled train. A great many persons, especially those outside of train service, carry the impression that the heavier responsibility rests on the shoulders of the engineer of the passenger train, because of "humanity that rides in the coaches behind," not thinking that every inferior train must keep out of the way, and that railroad companies make special provision for public safety by removing even the possibility of any obstacle to the safety of these trains; the work of the one is laid out for him, and is uniform every day, while the work of the other is ever varying, and in addition to keeping clear of danger, he is expected to give dispatch

to the trains under his charge; it is to this latter class of engineers that I desire to allude in these papers.

Before starting out on your run in addition to knowing that your engine is supplied with all necessary tools, fuel, water, etc., go over in your mind the possibilities that are before you; considering safety first; dispatch next; many have met their "Waterloo," by reversing this advice. When you receive your train order, read it thoroughly and give it to the fireman, getting his understanding of the same; *never read an order the second time for fear that you may have misunderstood it at the first reading*; have it thoroughly impressed on your mind at the first reading; continual reference to an order shows that you have no confidence in your memory, and the more it is practiced, the less you will have. So run as to economize in the energy of your engine as much as possible, in relation to the time you are supposed to make. Don't let the supply of water to the boiler exceed the evaporation; the laws of supply and demand apply to locomotive service, in all things, as well as to other economic questions. Let the failures of other engineers be object lessons to teach you to avoid the circumstances which caused them. You will probably notice that such trouble generally results from being in too much of a hurry, and you may also notice the frequency with which engineers get into trouble inside of yard limits. Here is one thing that I wish to especially impress upon your minds. Always have your train under control at stations; it don't matter whether passenger or freight; whether it is obscure or not, the rules of railroads provide for this, and often, instead of protecting the rear end of their trains, trainmen take advantage of the rules governing trains inside of yard limits.

In approaching stations, notice first if the switches are in proper position; next, the position of the order board; instruct your fireman to notice, particularly, these conditions; make your time outside the yard; the control of your train rests principally with you, and a brakeman's work is performed easier by shutting off in season; don't use engine brakes to make stops, reserve them for emergencies; your friends of the brake wheel will probably notice this, and more especially if you do their work for them, and to express their appreciation may hang their badges on the brake lever.

These are only a few of the points to be considered for the safety of trains, and I won't weary you with any more platitudes touching successful operation on the road.

The maxim that "no man lives unto himself alone," has special application to locomotive service; for the work of the engineer affects, possibly, many trains on the road.

Imagine any contingency that is liable to occur to prevent the successful completion of your trip; disaster overtakes the person who is not looking for it. Do your own thinking, and have plenty of it on hand; many lose their positions from thinking instead of acting at critical times. Be self-reliant; your judgment of time, speed, and circumstances, should be paramount to everything else. You will possibly have numerous advisers; always take what advice is offered,

and act on just as much of it as you think consistent with your own judgment of the requirements of the case.

Finally if you are not such a brilliant success as an engineer as to lead you to believe that you are not adapted for the business, don't be discouraged. The idea that one must be specially gifted by nature to be successful in his vocation is wrong; the mental faculties may be cultivated to a high degree by their constant exercise; as the athlete by systematic exercise, develops a particular muscle, so may the mind be developed by forethought and a knowledge of your own requirements. The saying that, "An engineer is born, not made," is a libel on the Creator.

[To be continued.]

---

## HOW TO FIRE A LOCOMOTIVE.

BY WILLIAM P. BORLAND.

---

The following remarks taken from an English work, *Locomotive Engine Driving*, are so nearly the thing that I reproduce them:

"The coal-fire of haycock shape, eminently associated with failures through want of steam, is made by shovelling the coals in the middle of the firebox, a practice about as far behind the times, comparatively speaking, as the use of the flint and tinder-box would be in the year 1875. The characteristics of such a fire are uncertainty as regards making steam, and certainty as regards destruction to firebox and tubes. It generally draws air at the walls of the firebox, and, in consequence, the fire-irons are always in the fire, knocking it about and wasting the fuel. As such fires are formed in the centre of the grate, they weigh down the fire-bars in the middle, and may even cause them to drop off of their bearers or supports. But there are greater evil consequences even than these: the cold air being admitted into the firebox up the sides, instead of in the middle, comes into direct contact with the heated plates and stays, doing them a deal of damage by causing intermittent expansion and contraction.

"That the fire in a locomotive firebox should maintain steam under all circumstances of load and weather, should consume its own smoke, should burn up every particle of good matter in the coal, and, in fine, should be worked to the highest point of economy, it requires to be made in the beginning, and maintained, to a form almost resembling the inside of a tea-saucer, shallow and concave, where the thinnest part of the fire is in the centre. A fire of this form makes

steam when other fires do not, being built on a principle that never yet misled either the driver or the fireman. It has brought a man a good name many a time.

"How to fire? This is a very important question.

"The first shovelful of coal should find a billet in the left-hand front corner; the second shovelful in the right-hand front corner; the third shovelful in the right-hand back corner; the fourth shovelful in the left-hand back corner; the fifth shovelful under the brick arch close to the tube-plate; the sixth and last under the fire-door. To land this one properly, the shovel must enter into the firebox, and should be turned over sharp to prevent the coals falling into the centre of the grate or the fire.

"It will at once be seen that this fire is made close against the walls of the firebox, and in actual contact with the heating surface; also that the principal mass of the coals lies over the bearers which carry the fire-bars. The centre of this kind of fire is self-feeding, for, by the action of the blast and shaking of the engine, the lumps in the corners are caused to roll or fall towards the centre. On this system, the centre is the thinnest part of the fire, quite open and free from dirt; the dirt falls down by the sides of the copper plates, and assists in preventing the cold air from touching the plates. With a fire of this description, the air or oxygen can only get into the firebox and into the neighborhood of the tubes through the centre, through the fire, and, mingling with the flame, it becomes instantly heated to a very high temperature before entering the tubes, which are thereby assisted in maintaining an even pressure in the boiler.

"The secret of first-rate firing is to fire frequently, a little at a time. There are, no doubt, some who will say, 'That may be all right to talk about, but I never could fire my engine that way; she burns her fire a great deal stronger in some parts of the firebox than she does in others, and if I should attempt to carry a fire of that description I would soon come to grief.' To such it will only be necessary to say, the fault is not in the theory, but in your engine. There are appliances for regulating the draft on all locomotives, and if your engine does not burn her fire evenly it shows that they need adjusting. Have it attended to."

Many of the readers of this department will, no doubt, remember the controversy regarding horse power, which about two years ago was carried on by Dr. Wilson, on the one hand, and several other contributors to the department on the other. I was reminded of that controversy a few days ago because of an item I read in the *Engineering News*: "The hub and shaft of the cable-wheel for the new power house of the Broadway cable road weighs about forty tons. It was hauled, this week, by twenty-six horses, from the foot of Thirty-ninth street to its destination." It will be remembered that Dr. Wilson figured out about 10.5 horse power for an 18x24 locomotive. It occurred to me, while reading this item, that if it required twenty-six horses to pull this load of forty tons, two 18x24 locomotives could not budge it. Ah there!

I hope Mr. Lockwood will let us know how that wonderful Shaw

locomotive acts with her new eight inch steel pipe. I see the editor of *The Engineer* has condemned the new pipe already. The Shaw locomotive has four ten inch cylinders, and, following the rule that the steam pipe area should be one-fourth the piston area, the editor of *The Engineer* very properly concludes that the new steel pipe will still be too small—it ought to be ten inches instead of eight. I am a little afraid that the Shaw will soon be consigned to the limbo of exploded fallacies.

I notice that the contributors who did so much to make the Mechanical Department interesting a few years ago, have nearly all stopped writing. I hope all who possibly can—"Eccentric Strap" especially—will form a New Year's resolution to neglect the department no longer. I was once called a bushwhacker and a lot of other hard names because I signed "Vacuum," so I have concluded to drop that, and subscribe my real name to my writings.

---

## STUDYING VALVE MOTION.

---

BY ANGUS SINCLAIR, AUTHOR OF "LOCOMOTIVE RUNNING AND MANAGEMENT."

---

There is no topic of conversation so common among enginemen as valve motion, and there is no popular subject so indifferently understood. The want of thorough comprehension of the complex influences which act on the movement of a slide valve operated by a link motion is not confined to enginemen and workmen. There are few of the men in charge who understand the subject properly. This is not to be wondered at, for a man may be well posted on the methods of keeping valve gear in order and yet know little or nothing of what the results would be of changing the arrangement of the mechanism.

I once personally received a striking lesson on this subject of how little a man may understand the extent of his own ignorance. Since boyhood I had interested myself in valve motion, and had enjoyed considerable experience in the setting of valves and in the manipulations of the motion. I supposed that I was master of the subject so far as link motion and slide valves were concerned. It came to pass, when I was writing the articles on "Locomotive Engine Running," that it was necessary to write a chapter on valve motion. The duty brought no misgiving and appeared to call for no special study. One evening, after spending the greater part of the day manipulating

to improve the port openings of an old Hinkley engine with worn eccentrics, I proceeded to write the article on valve motion. Then I made a startling discovery. The store box of my knowledge concerning valve motion was nearly empty, and contained merely superficial facts which every good valve setter knows. Writing for the instruction of others is an admirable means of self-examination. After finding out how little I knew about valve motion, I set to and devoted all my spare time for four months to the study of the subject, and then I approached the writing on it with much humility.

The most difficult part in the study of valve gears is the relation that the various parts of the engine's mechanism have upon the movements of the valve. This knowledge is essential mostly for designers, but it is very convenient for every one having anything to do with the repairing or setting of valves, and it is a good accomplishment for every engineman to possess.

A man may be a successful engineer and not know how the steam gets in and out of the cylinders. This kind of a man has become skillful by imitation, and his work is not based on knowledge. The policy of railroad employers at the present day is to require both skill and knowledge in the men in charge of locomotives. That being the case, it is the duty of firemen to learn all they can about the construction and design of locomotives.

It used to be the case that a young man trying to learn anything regarding a locomotive, found like a barrier put across his path the sentiment, "The proper way to learn things about a locomotive is to examine the engine itself." The youth who ventured to resort to other sources of information was looked upon as a vain theorist. I was once very much amused with a fireman whose room I visited. There was a book on the table, and on taking it up I found that it was Forney's Catechism. The owner blushed and stammered excuses for having the book. His manner spoke of the influence which the anti-book sentiment had upon a sensible man. He is now a master mechanic.

The prevailing practice of examining firemen before promoting them to the right hand side has done much to dissipate the prejudice against resorting to books, drawings and models for information respecting the locomotive. There are now but few railroads where a fireman need be ashamed to tell that he is using outside aids for acquiring knowledge about the locomotive.

When I first began to study valve motion I used to look at the engine's cylinder, and try to imagine how the valve stood in relation to the ports at the various points of the stroke. Some men have minds that can picture all the necessary details to study valve motion in this way, but mine was not comprehensive enough, and I could not mentally follow the events of the stroke. A draughtsman to whom I mentioned the difficulty of following the valve's movements, suggested that I make a drawing of the cylinder and valve, and put the latter on a separate sheet, so that it could be moved on the valve seat. This proved an excellent means of teaching me the elementary things concerning the movement of the valve and the

admission and release of steam. After a time the mind gets so trained that the events of a stroke can be followed mentally without aid of drawings. The valve motion models that are now in use give much more convenient assistance to study than drawings of valve and cylinder; but those who have not access to a model will find the drawings a great help. Even if a young man has access to a model it is good practice to make drawings of cylinders and valves. Skill as a draftsman is not necessary to make useful drawings of this kind.

After the elementary facts are learned respecting the admission and release of steam and the actions that regulate these operations, the student should, by the use of drawings or engravings, follow the movement of eccentric, link, rocker and valve, and find out how the valve movement is influenced by changed proportions or arrangements of the mechanism. The purpose of a slide valve is to open and close the openings to the cylinder at the right time. Designers do their best to scheme a motion that will open the ports quickly at the beginning of the stroke, cut off the supply early enough to permit the steam to be used expansively, open the ports in time to let the exhaust steam out of the cylinder without causing back pressure against the piston during the return stroke, then to have the cavity edge of the valve cover the port just long enough to imprison within the cylinder sufficient steam to make the piston raise compression to the pressure of the steam chest. These are spoken of as the events of the stroke, and are known as admission, cut-off, release and compression. A good motion will make the events nearly uniform during both strokes. Perfect uniformity is not possible with a link motion, but a skillful designer will make it near enough for practical purposes.

It is a very common thing to find on tramming an engine that the cut-off takes place much earlier on one end than on the other. The thing that influences this more than any other is the position of the saddle pin. When an engine is found in this condition the usual remedy of valve setters is to adjust the cut-off at the expense of the lead. There are other temporary remedies which a good knowledge of the valve motion will suggest. The man who understands the motion thoroughly is much more fertile of resources in cases of emergency than he who merely knows how to divide up to make adjustments.

A thorough knowledge of valve motion cannot be acquired without the study of the geometrical principles relating to the subject. Those who have an inclination in this direction will find the study interesting as well as instructive.

When our older locomotive engineers were young there was good excuse for the men handling engines knowing nothing about valve gear. Knowledge of the principles on which valve motion was designed was confined almost exclusively to the drawing room. Popular acquaintance with valve movements was so limited that the valve setter in a shop was regarded as a man of mysterious knowledge, and he generally guarded his acquirements with jealous care.

This is all changed. Books are everywhere to be found with descriptions of valve motion so simple and so well illustrated that the dullest intellect can readily understand them. What was formerly a labor of difficulty is now an attractive amusement. The valve motion model to be found in so many firemen's lodges has taken away all the mystery from the valve setter's art.

---

## LOCOMOTIVE ENGINEMEN IN EUROPE.

---

BY JOHN A. HILL, EDITOR OF LOCOMOTIVE ENGINEERING.

---

During a ten weeks' trip on the other side of the water this summer, I had a chance to observe the work, condition and wages of the locomotive enginemen of Germany, France and Great Britain, and compare them with those of our craft who shovel coal and handle throttles in the land of the stars and stripes.

In Germany the principal roads belong to the government, and the engineer and fireman are much like soldiers; they wear a military uniform and never wear overclothes. They are practically safe from dismissal during good behavior; their runs are light and their pay small, 1.800 marks (24 cents) the first year, and 2.100 the third and highest pay.

Germany is a protected country, but her workmen, especially mechanics, get very, very small pay. Machinists get  $4\frac{1}{2}$  marks, a little over a dollar. Engineers are paid premiums, so that an extra good man may nearly double his income. This is encouraging.

There is no organization among the men, so far as I could discover, and every tub stands on its own bottom. The strongest brotherhood in the world could do nothing in the shape of controlling the rate of pay established by the government, and the use for an insurance order is nullified, as the men are pensioned in old age or disablement, just the same as a soldier. These men run open engines, without equalizers, seats or cabs, and yet seem to be comparatively happy.

I was unable to see how they lived, but I am assured they live fairly well, because their pay is higher than the average public servant, and almost all men in Germany are public servants. All the railroad men, telegraph men, postal employes, and those in the parcels post (doing a business like express companies do here), are government employes, and all the rest are in the great standing army or on the police force. Berlin, a city of a million and a quarter inhabitants, has 5,000 regular police, 2,000 mounted police, and 20,000 sol-

diers—more men than the standing army of Uncle Sam. The women do the work.

The French enginemen are better paid than the German, and are not under the care of the government—sort of a free moral agent. They have awful ugly engines to run and fire, but are fairly well off; they are not organized but they have some unwritten laws that none of them will break over.

England is a free trade country and I expected to find the enginemen there in bad shape; everybody was talking so much about pauper labor. The English roads are conducted on a different plan than ours; the enginemen run absolutely by signals and are in no sense the "railroaders" they are here, yet they have some virtues hard to find on most American roads. They ride a hard engine but on a good track, stand up to their work, try to be as economical as possible, and are sincerely sorry for fellows who are "cooped up" in a cab and have to run in a country where they haven't got things down fine, like they have at "home."

English roads are owned by private corporations, but a board of trade investigates every accident of any consequence, so that the operating officer is not able to settle matters by blaming and discharging a man; the board of trade fix the responsibility, and as often blame the management as the men. This causes the making and enforcing of rigid rules. The difficulty with their board of trade is, that it is usually composed of retired army officers who know little about railroads—sometimes you can shut their eye. You can't bribe them; there is a patriotic back-bone in the English system that has something admirable about it. Their public officers receive no pay—I am speaking of mayors, aldermen, members of parliament, etc., and are very proud of their records for fearlessly hewing to the line, letting the chips fall on whoever is in the way.

The enginemen get just about half what they do here. Eight shillings is the highest, seven shillings and sixpence, the average engineer's pay by the day; none run on a mileage basis. A shilling is 25 cents of American money. The firemen get three to four and-a-half shillings. They have a good law that prevents the employment of an engineman for more than 12 hours continuously, under any circumstances, and, in ordinary service, if on duty 8 hours or more, he cannot be recalled for duty until he has had 16 hours of rest. They have an association to which both engineers and firemen belong, but it is not well filled at all, on some roads none of the men being members. There seems to be considerable jealousy of each other, and not a little tale bearing, and, as they call it, "besting" each other.

The British engineman is trained to be careful, to prevent smoke, to save fuel, to take care of supplies, to be exceedingly careful about oil and the care of oiling devices, and you see very little reckless waste, with the remark, "Oh, the company can stand it." The reason for this steady practice of economy is three-fold, sometimes all three are at work at once and sometimes only one; they are:

- 1st. On the best roads the men receive a percentage of the saving

of oil and fuel, and premiums for keeping on time for the most miles on the most trips.

2d. Bulletins are posted showing the results and men are fined and posted for neglect of details.

3d. Men are discharged for failure to keep somewhere near the standard.

There is a practice in the country of publishing a performance sheet, not only of their own road, but all the roads in the kingdom, so that comparisons can be drawn.

I visited the homes of some of these engineers and found them living in neat brick cottages of from four to seven rooms, with hot and cold water, in most cases, bath rooms, etc. A house of this kind, with five rooms, rents for four or five shillings a week; you can get a very good and comfortable house for five dollars per month. There are some small taxes that a tenant has to pay besides this, but it is small.

I went with one engineer in England, to the market, where I saw him buy beefsteak from the American "h'ox" for seven pence a pound—14 cents. I can't get it for less than 25 cents. I saw a Scotch engineer buy a barrel of American apples cheaper than they are sold for in New York, and my wife's heart was broken when she saw the twin sister of her Singer sewing machine, for which she gave \$55.00, in a window, marked £5, 8s., or \$26. I don't pretend to say which is best; this is not a political journal, but there are no pauper engineers and firemen in Great Britain. They get only half the pay our men receive, but they can live as well on half as much. I do not believe they do live as well, on an average, but they have more money in their excellent postal savings bank than our men have, and I will bet on it.

These Britishers are good men in their line of work and do good work with what they have to work with, and when they come to America they are not working at the old country rate of pay; they can read English.

Standing in the engine shed at Crewe, my hearty old friend, Ben. Hitchens, who came over with the Webb compound, some years ago, said to me: "There's one thing you boys have the best of us on. While I was at Altoona I never met one of the lads with more than five children; now, there is hardly a man running here, that is 40 or 45, that hasn't ten or more. There's Robinson, he's got 13; Davis, 11; Holdin, 12; why, I've got 11 myself."

There is an underhanded aristocracy scheme, known as students, gentlemen's sons, who go into railroading under instructions and pay high for it, about \$1,500 for three years. These men generally get shoved along into foremanships, etc., to the exclusion of road or shop men of merit and ability. An engineer is seldom, if ever, anything else, and a boy who learns his trade in the shop must hope for nothing higher than journeyman. A man can advance in America, if he tries, and grasps the chance when circumstances hold out the opportunity. Hence, I would far rather go firing in America to-morrow than to take a job at the grindstone crank throttle of the "Flying Anything" there is on wheels in the domain of Her Majesty.

## DISSIMILARITY.

BY S. A. ALEXANDER, AUTHOR OF "READY REFERENCE FOR ENGINEERS AND FIREMEN."

Of all the strange features of nature, one of the most wonderful is that no two objects can be found that are precisely alike in every particular, and that no two things produced by art can be made identical. The attention of the writer has for many years been drawn to this fact by observing the difference in the performance of locomotives. Something over forty years ago a number of engines were built at the Baldwin works for the Philadelphia & Reading R. R. Co. They were six wheel connected engines with flexible trucks, the wheels of the trucks were connected to the driving wheels by crank pins, both truck boxes and side rod brasses were rounding in their pedestals and straps. Of course there was no earthly use of having these engines "built that way," but the object was to have them pass short curves easily and without damage to engines or track. After a number of these engines were placed in service on different roads, some one found out that flat pedestals and flat rod brasses would save the trouble and expense of turning. But to return to the subject of dissimilitude. The varied performance of the engines took us all by surprise, as we found that although they were all built from the same drawings, that the same patterns were used, and that the same mechanics did the work on them, one of the engines was better in every respect than any of the others, while the others varied in their performance in different points; one would steam better, another was faster, another would pick up its train better, and draw a heavier train; and while one engine was best in all respects, one was the poorest of the lot. And the same dissimilitude obtains on engines now being built. With all of our modern skill and facilities, we can only approximately approach the desired object of building engines with their parts apparently arranged exactly alike, that will not vary in their workings. At first it was argued that the difference of performance was the fault of the runners, but a change of engineers produced no difference in the results. As a rule we had good engineers in those days, most of whom had served regular time as machinists, and all had worked in the shops on repairs, having previously served as brakemen, conductors and firemen, which was the practice and order of promotion. The master mechanic employed all brakemen, who, when competent, were raised to be conductors, then they fired awhile, after which they had to work in the shop about a year, then if they could handle the tools pretty well they were given a throttle, providing the shop foreman considered them capable to do such repairs as was then required of a runner. Regular machinists were not required to go through that mill; it being thought in those days that if a man could build an engine, he could surely run one. But this proved to be a delusion, for there are

good engineers now (as runners I mean) who are not even expert at handling a monkey wrench. On the other hand I have known quite a number of machinist engineers who never learned to carry water properly. Indeed I knew one that started out on a freight train and did not get back home before another engineer who was running a passenger train had passed him seven times on a run of only ninety-six miles. So here again we see that not only two engines cannot be found that are alike, but in this case there seems to have been a very striking case of dissimilarity of the two engineers. But it is a still greater mystery to know that no two people see, hear, taste, feel or smell, alike whether we take the individual senses as nouns or verbs. Take the sense of smell for instance: what may be very agreeable to some persons is very obnoxious to others. It is a profound mystery that all persons, no matter how cleanly may be their habits, every person has a peculiar odor of their own, that can be detected by well educated noses. The writer is well acquainted with a lady who can take any piece of clothing that has been in use by any member of her family, even after the clothing has been washed and ironed before being again worn. This lady can tell by the smell without seeing the clothing to which one of the family the piece belongs. King Solomon says that "there is no new thing under the sun," but as we cannot find anything, exactly like any other thing, it would seem only reasonable to think that everything is constantly being renewed, and consequently there is nothing old in the world—unless indeed the theory set forth by Captain Marryatt's Boatswain, Chuckston, is accepted. Chuckston is made to say that there is a recurrence of every event no matter how trifling, and that every atom in the world resumed its identical condition every thirty-three thousand three hundred and thirty-three years. But of this we, I think, can all safely say as Mr. White said at his examination as a witness in the postal Star route trials "I don't remember."

---

### SETTING ECCENTRICS BY THE SPOKES.

---

MR. EDITOR:—"A Mechanic," in the December number says that eccentrics may be set by counting up or down four spokes from the crank pin spoke. But this cannot be accurate, for the wheels differ in the number of spokes, and therefore in their distances apart, and what might be right on a 12 spoke would not be right on a 13 or 14 spoke wheel. Therefore "Mechanic" will have to try again and get it a little closer.

**Compounds.** Walter C. Garaghty, writing on the compounds in the December MAGAZINE, thinks it will be some time before they will replace the ordinary locomotive, because the only superiority they have shown is economy in fuel. If this point is granted,

it establishes all that is claimed for them, and is the reason why they are being introduced so rapidly. A table of the performance of locomotives, compiled from the reports of forty-three of the largest roads in the country, shows that the cost of fuel runs from about four cents up to eighteen cents for each locomotive mile, the average being between seven and eight cents. If, as many of the tests made with the compounds seem to show, the economy is 25 per cent., it would make a difference of two cents per mile, and as the locomotives average about 3,000 miles per month the saving would be about \$60.00 per month on each locomotive, or \$720.00 per year. A road owning 200 engines would thus save \$144,000, or enough to pay 6 per cent. on \$2,400,000 capital. Such an item is certainly worth looking after, as many of these roads use as high as 800 and 900 locomotives. While they are thus an advantage to the companies, they are also a great saving to the "fireboys," for it will make a thousand tons of coal less to handle in every four thousand, and would thus greatly help the health, comfort and longevity of our members. Instead of desiring to retain the old, "Garaghty" had better put in an application for the first compound out on his road, and see whether three out of four will not make it very much easier on his back and arms. If, as is admitted, it takes less steam to do the work, it certainly will take less fuel to make the steam, and if the exhaust is so much lighter and the passage of the gases so much slower, they will yield up more of their heat to the firebox and flues, and cannot help being better all around than the ordinary locomotive, which raises a storm in the fire and is then expected to yield economical results.

***Eccentrics.*** "Thos. P. Knapp" thinks that an eccentric can be defined as a "circle within a circle," and says it "refers to any round or oblong circle, with a moving or round centre around which it is fastened." A circle can be within a circle, and yet have none of the essential features of an eccentric, and in referring to an oblong circle fastened to a moving centre, "Knapp" has certainly made a mistake also, for his oblong would not move if surrounded by a tight fitting oblong eccentric strap.

An eccentric is defined by Webster as "a disk or wheel having its axis out from the centre." This is short and good, but hardly explicit enough to satisfy the student. An eccentric is a round disk, or wheel, turned up to a true circle from its centre, and derives its eccentricity by being fastened to the shaft or axle which moves it, with its centre (the centre on which it was turned up) out from the centre of the shaft or axle on which it is fastened, and the amount of movement depends on the distances between these two centres.

Take "Knapp's" idea of "a circle within a circle," and let the centres coincide, and you would not be able to get any motion at all, for if the inside circle or wheel moved, it would not move the outer circle at all. This ought to suffice to show "Knapp" that a circle within a circle is not a true definition of an eccentric, but that it would be better to simply confine it to a description of the eccentric cam as before given, for, even if no allusion is made in that definition to the

outside circle or strap, it embodies a full idea of an eccentric, and a cam so turned up and afterwards so fastened to an "axis with its centre out," is ready to communicate a reciprocating motion to any mechanism to which it may be connected by rods with straps encircling the cam.

An oblong cam is not used in locomotive practice at all, and could not be used at all if surrounded by straps having a close fitting oblong opening in them, for they would "stick" when the long diameter of the eccentric tried to get through the small diameter of the opening. An oblong eccentric could be used only in a strap having an opening equal in diameter to the longest diameter of the cam, and would then produce an irregular reciprocating motion to its mechanism, for a part of its revolution would be taken up in getting over the lost motion between the oblong cam and the round opening, and the movements would all be made while the cam was at or near each end of the stroke. It may just be possible that such a movement may be in use in some of the many hundreds of thousands of machines in use, but generally an eccentric will be found to be a true circle turning inside of another true circle and obtaining its motion by the differences between the centres.

### ***Light or Heavy Fire.***

"Fireman," of South Orange, is between the horns of a dilemma, for if he fires to suit his engineer he cannot get steam, and when he fires to suit himself, he has steam but his fire does not please the engineer, and the poor fellow asks what he shall do. This is a hard question to answer so as to preserve the peace between the two.

Having put in nearly ten years in shoveling "diamonds"—all hard coal at that,—and run nearly five years—off and on,—I may know a little about hard coal fires and firemen. The first and most desirable thing for an engineer and a fireman is that their locomotive shall make steam to do her work, the next to do it with as little fuel as possible and with the least amount of work for the fireman.

A light fire takes less coal in the firebox at first than a heavy fire, but if it has to be watched and fed very often, and then in spite of all care dies out, and then the dead spots have to be knocked out and refilled with new coal to the detriment of the steam, it is really a question whether it would not be better to put in a heavy fire at once, and the more so as "Fireman" says that he has no trouble in getting steam with a heavy fire. A light fire should, as the engineer says, show good results with an enlarged area of the nozzles secured by cleaning them out, but on very many locomotives a light fire is of no avail to secure steam for a round trip, for it is just as "Fireman" says, after steaming a while the fire dies out, and then comes trouble.

The first locomotive I fired steady was a mogul, who had got herself a very poor reputation as a steamer, and in spite of my best endeavors she would not make steam with a light nor a heavy fire. Much blame was put on me as a new fireman, and I was foolish enough to believe that much of it belonged there, but after "murdering" along in this fashion, cleaning fires as much as seven times a

day, having not much steam or water while on the road, and using the injector to fill her and the blower to get her hot in every passing switch, and sometimes also on the main track, a change came. Another engineer was put on to run for a week, on account of the sickness of the regular man, and seeing how she worked—or rather did not—her fire, he proposed to make her steam. Of course that pleased me, and I watched to see how it was done. We went to the front end and raised the draft pipe, or petticoat pipe as it is sometimes called, a little over three-fourths of an inch. I found that this had made so great an improvement that I did not think that he could make it better, yet, as he said he would, I was very particular to note just how the pipe was, in order to be able to put it there again, in case he failed. The pipe was raised again, this time a scant three-fourths of an inch, and was never moved from that position afterwards, while I remained on her, some seven or eight months more.

I ran that engine's fire for a whole day without cleaning (100 miles) just to prove it could be done, and ran her often eighty miles, and ever had lots of steam, but—strangest of all—it made no difference what kind of a fire I carried in her. If I had time at a tank I could put in a fire to run three or four miles up a heavy grade; if my time was short I could put in a light fire and depend upon her getting hot enough, so that I could feed her whenever she needed any coal.

Perhaps an examination of the draft pipe of "Fireman's" locomotive, or a change in its position, might effect such wonders as to make her steam with a light fire and thus make her work to the satisfaction of both engineer and "Fireman," and recommending experiments in that line, I hope, if tried, will solve the difficulty. \*

---

## LOCOMOTIVE RUNNING.

---

**MR. EDITOR:**—As might have been expected my criticism of the old engineer, who after running an engine for thirty years, did not know what became of the steam after it had done its work, has touched a tender spot in some quarter, and "A Member" from Chicago has plucked up courage to try to give his reasons why he does not like my writing on that point, and after all he gives no reasons, but ventures to make some guesses.

In reply to my statement that said old engineer *blundered along* some way (I thought I could use no other term to so good an advantage, for a man so much in the dark would certainly stagger along). He thinks he has learned some things the young engineer has not learned. I can not give him the credit of this statement, for if he were capable of learning anything at all, he ought during his thirty years or over of service on a locomotive have found out that the exhausts, which have made music to his ear, by day and by night, in summer and in winter, in sunshine or storm, during all these years, is but the exultant shout of the steam, at escaping from the dominion of man, and securing its liberty without having yielded but a portion of its power, to do man's bidding. If thirty years listening to

this song has not taught him that much, I do not think he has learned anything, except probably that if the reverse lever is ahead and steam is given, his engine will move ahead, and that if the lever is back she will move back, and that if steam is shut off she will stop after a while, but these things can be learned by any 10-year old boy in one hour without in any way straining his brain. Many females display far more mechanical "gumption" in the use of their sewing machines, than such "starters and stoppers" show in the management of their locomotives.

"A Member" thinks it takes practice to make a good engineer; I am willing to grant this point, provided there is something to start with. "A Member" will perhaps admit that it takes practice to make a good reader, but if a "fellow" never even learned his A. B. C. how much practice is it going to take to make a good reader? is a question for "A Member" or any other man to answer, and when answered will also serve as an answer to the engineer in question and others like him, who decry book learning and pride themselves on their practice, which often consists in doing as they saw some one else doing, without being able to give any good reason for it. It is men of this class "who sit on long tacks" when they start out as runners, because they feel that at any time something might happen, which would bother them to correct, and which they would not know how to remedy. Now I will venture the assertion (and "A Member" will be able to test its truth in Chicago) that at least eight out of every ten of those old engineers on his road, know better than that *old engineer*, about the working of steam in the cylinder and are thus able to do good work. He may be able to find the mate to that old engineer, and if he does I hope he will search the record, and see how many scrapes he has been in, and how often he has verified the old adage: "The bigger fool—the better luck."

It is indeed true that a great improvement has been made in locomotives and their equipment during the past 15 years, and due credit should be given to those who ran and fired the crude and imperfect machines of years ago, but past achievements will not suffice, and they must keep step in the advance or be left behind in the onward march of progress.

Our boys have to fire 10 or 12 years and they think this is long enough to qualify them for the other side, and they do not favor the hiring of engineers, because according to the rules of arithmetic, if one were hired and one promoted, the natural result would be a doubling of the time of service as firemen to 20 years, which would be too long an apprenticeship, even if firemen are better paid and have less work than in former years. In a spirit of fairness "A Member" should not ask others to do what he did not—and probably would not—do, for as he fired—as we say here—*only seven years*, he should not ask others to do what would be sure to make them fire 20 years. As he admits having run only four years, I suppose he is not calling himself an old engineer, and so I hope that none of my remarks have touched him, and that it was only in defence of a body of men, as he thought unjustly accused, that he wrote his reply.

Wm. Weiler.

## POPPING OR NOT POPPING.

MR. EDITOR:—The law (which in some respects is very exact and particular) never requires impossibilities, and judges have repeatedly decided cases in that way. In regard to the “popping off” of a locomotive the same rule holds good, for it is at times impossible to prevent it, especially when you are firing “hard” coal, which is the only kind I ever fired. I have thus never fired the “Frisco coal” alluded to by “Rastus” from Temple, Texas, who wants information how to do impossible things. When I wrote my former article I used the term *useless* in alluding to much “popping off” which is being done without an effort to prevent it, and I also knew very well that if the fireman did not have the co-operation of his engineer all his efforts would prove futile.

Now, in firing hard coal on a “hilly” road, we have to always have a comparatively heavy body of fire, whether we are using steam or running down a grade, and even when standing still for 10 or 15 minutes. The only way to prevent popping that we have is to cool them off by opening the fire door while the locomotive is still working, or by injecting some water just after steam is shut off. If the engineer insists on having the full quantity of steam right up to shutting off of steam, no fireman can keep her from popping, and the blame must then be put on the engineer. Again, if the engineer comes around and jumps upon his engine, pulls her wide open and leaves a station without saying a word, and then growls because the steam goes back 15 or 20 pounds, he ought to be reminded of the time probably not so very long ago, when he was shovelling coal for some one who had lost his good breeding or never had any, and asked what his opinion used to be of men of that kind. It is now five years since I was promoted, but I have not yet forgotten that firemen are men, and have ever tried to use them as men, and as no train can be run with success and satisfaction, without the full and cheerful co-operation of the engineer and fireman, I have ever made it a point to have a pleasant word for the fireman on coming around, to inquire whether everything appeared all right, to give him such information about the run as I had, or if any changes were made to inform him, and thus have him posted. If I did not do this, I would think I was not doing my duty toward him, and would not expect as good a result from my helper, and would not blame him if she did not stay up to the popping point, nor if she did roar once in a while, and no other sensible man would blame him. There are men however who utterly ignore their firemen, or regard them as necessary nuisances whose presence they must endure, as they cannot entirely dispense with their services, and from such our prayer must be “Lord, deliver us.

I hope “Rastus” will now understand me better and believe me his friend.

Vulcan.

## SOME THINGS TO REMEMBER.

The following questions and answers are from the *American Machinist*:

P. B., Houston, Texas, writes: Kindly enlighten me on the following, through your paper: I am classifying locomotive engines, and among other things I am required to give the tractive power for each class. To do this it is necessary to know the average pressure in the cylinder during the stroke when the throttle is wide open, and the engine carries its full pressure, I suppose. What would be the simplest way of determining this average pressure without the use of the indicator? A.—In computing the mean effective pressure, for the purpose of finding the tractive force of a locomotive, the throttle valve is supposed to be wide open, so as to obtain as near as possible an initial pressure in the cylinder equal to that in the boiler, and the link motion is supposed to be in full gear. Under these conditions, when running, the initial pressure in the cylinder will generally be a little less than the pressure in the boiler, say 5 pounds; this reduction is due to friction in the pipes and passages, and sometimes to a slight condensation. It should also be remembered that, in computing the mean effective pressure, the absolute pressure should always be taken into account; the latter is equal to pressure indicated by the steam gauge plus 14.7 pounds, or, in round figures, 15 pounds. To find the mean absolute pressure, add one to the hyperbolic logarithm of the ratio of expansion, divide the sum by the ratio of expansion, and multiply the quotient by the absolute initial pressure in the cylinder. Thus: Suppose the boiler pressure is 120 pounds, as indicated by the steam gauge, the initial pressure in the cylinder will then be, say  $120 - 5 = 115$  pounds, and the absolute initial pressure will be  $115 + 15 = 130$  pounds. Now we shall assume that steam is cut off at  $\frac{3}{4}$  of the stroke; the ratio of expansion will then be  $4 \div 3 = 1.3$ ; the hyperbolic logarithm of this number—which you can find in tables given in nearly all engineers' pocket-books—is 0.262; adding 1 we have 1.262, and the mean absolute pressure will be:  $\frac{1.262}{1.3} \times 130 = 126.1$  pounds; subtracting from this the absolute back pressure, say 18 pounds, we have  $126.1 - 18 = 108.1$  pounds for the mean effective pressure. This is only a close approximation, because the clearance is not taken into account, but at such a late cut off this will not affect the result much. Many engineers take a shorter course, by simply taking 80 per cent. of the boiler pressure, thus: if the boiler pressure is 120 pounds, then  $120 \times .80 = 96$  pounds mean effective pressure; this is somewhat less than found by the first rule, but agrees better with actual pressure when the engine is running with the links hooked up to a certain extent, and is preferred by some engineers in computing the tractive force. After the mean effective pressure has been decided upon, then the tractive force is found by multiplying the square of the diameter of one cylinder in inches by the mean effective pressure, and by the stroke in inches, and dividing the product by the diameter of the driving wheel in inches, the quotient will be the tractive power; the latter may again be limited by the adhesion of the drivers and rail. The adhesion is generally taken at  $\frac{1}{4}$  of the weight on the drivers, and in well-designed engines this should be numerically equal to the tractive force.

W. E. T., Rutland, Vt., writes: Please give me through your columns, the shortest solution of the following problem: I wish to prepare a table to show the amount of liquid contained in a tank  $24\frac{1}{2}$  feet long and 61 inches diameter inside, at successive quarter inches from the top to the center, so that when a certain amount is drawn out, I can, by measuring from the top of tank to top of liquid, tell just the quantity remaining. A.—Multiply the length of the tank in inches by the area in square inches; the product will be the contents of the tank. Thus, the length is 294 inches, the area is 2,922.5 square inches, and  $2,922.5 \times 294 = 859,215$  cubic inches. There are  $294 \times 4 = 1,176$  quarter inches

in the height of tank, and consequently for each fall of  $\frac{1}{4}$  of an inch there will be  $\frac{859.215}{1.176} = 730.625$  cubic inches of liquid discharged, leaving  $859,215 - 730.625 = 858,484.375$  cubic inches for the fall of  $\frac{1}{4}$  inch;  $859,215 - (730.625 \times 2) = 857,753.75$  for a fall of a  $\frac{1}{2}$  inch and so on. Should you wish to have the result in gallons, proceed as follows. There are 231 cubic inches in the gallon; hence the tank when full contains  $\frac{859.215}{231} = 3,719.545$  gallons. For each quarter of an inch of fall in the liquid  $\frac{730.625}{231} = 3.162$  gallons will be discharged; hence, for the fall of the first quarter of an inch there will remain  $3,719.545 - 3.162 = 3,716.383$  gallons in the tank, and so on, for other depths of fall. If there are braces in the tank, allowance should be made for the space taken up by them.

C. D. B., Springfield, O., writes: I would like to have your opinion in regard to the repair of a boiler, in which we have to put in a set of new flues. The metal between the flue holes in the back head is cracked in two places. The holes near the injured part have been plugged for two years and did not show any leaks. Would you go to the expense of putting in a new head? The boiler is 5 feet diameter, with eighty 3 inch flues. A.—We should put in a new head; under no condition would we allow a broken flue-sheet to remain. Boilers are dangerous things to fool with, and carelessness or stinginess in the repair of boilers should not be permitted.

And here are some from *Locomotive Engineering*:

W. H. T., St. Helen, Mich.: Will you please give me position of locomotive valve with lever in center notch, and why "out of gear." We disagree on that point here and want to settle it. A.—The valve is in position to cover both ports, and is called "out of gear" because the engine will not run in either direction with lever in center notch.

R. Cutter, Alton, Ill., asks: Can you let me know in your paper the proportions of different kinds of metal to make metallic packing for pistons and valve stems? A.—The exact proportion of metals varies with different makers. Many use regular babbit with success. One of the best makers (Jerome) keeps his mixture a secret. The U. S. people use 100 parts of tin, 9 of copper and 6 of antimony. The latter metal is used to harden. Vary it until you get the desired result.

M., Frankfort, Ky., writes: My question and answer (No. 99) was perhaps misunderstood, so I am not quite satisfied. What I wish to know is this: "The travel being found correct and the cut-off out, can the cut-off be made correct and still leave the travel as it was before the cut-off was corrected?" In correcting the cut-off won't it change the travel? A.—The length of travel is fixed by the throw of eccentrics and length of the rocker-arms, its even movement each side of the center of the seat is adjusted by the length of the eccentric blades. The point of cut-off (and all other functions of the valve) can be hurried or retarded by moving the eccentrics on the axle, as this cannot affect the throw of the eccentrics, the length of the arms of the rocker, or the length of the blades, it is plain that the cut-off may be changed without changing the travel.

A. S. S., Kingston, Jamaica, asks: Is not a two-cylinder compound, high-pressure cylinder 18 inches and low-pressure 28 inches, both 24-inch stroke, 180 pounds pressure, supposed to be more powerful than a simple engine with 18-inch by 24-inch cylinders carrying 170 pounds pressure; engines otherwise alike? A.—Hardly. The rule of the Schenectady Works is to make two-cylinder compounds with the high-pressure cylinder 1 inch larger in diameter than a simple engine of similar design and for similar work, the low-pressure cylinder is usually made 2.2 times the area of the high-pressure cylinder. Engines so built have been found to do the same work as simple engines of their class.

## A CORRECTION.

MR. EDITOR:—In the November MAGAZINE there appeared an article on combustion which was marred by an error that the writer, "T. J. H.," unwittingly allowed to creep in, viz: One pound of air, at ordinary pressure and temperature, occupies 13.003 cubic feet; therefore, to furnish the necessary amount of oxygen for the combustion of each pound of coal, we must admit into the fire mixture 35.3003 feet of air.

The mistake is made by confounding air and oxygen and according them the same value in the process of combustion, when, in fact, one pound of air only possesses one-fifth the value of one pound of oxygen for combustion purposes, for the reason that only one-fifth part of air, by weight, is oxygen, which is the only element in the air that is of any value in the combustion of fuel, the other four-fifths being nitrogen and of no use; it is as the chaff in so much wheat. One thousand cubic feet of air weighs 80.728 pounds; 53.85 cubic feet of air contains 1 pound of oxygen and 3.347 pounds of nitrogen; two and two-thirds times 53.85 is 143.6, therefore it would require 143.6 cubic feet of air to properly combine with 1 pound of coal instead of 35.3003 cubic feet; and each square foot of grate surface would require, providing an engine burned 2,500 pounds of coal per hour, 358.5 cubic feet of air per minute, instead of 88.1033.

On page 1,008, "W. J. S." answers his own question, which appeared in July MAGAZINE, on how to stop an engine off the centre when one side is disabled. Some time ago I heard the same question and answer, and memorized it for future use; not long afterwards, while running a 55-ton consolidation engine, I found it necessary to disconnect the l. h. side; I then tried this improved method of stopping a disabled engine and made a complete failure of it. Out of fifteen stops, I only stopped her off the centre twice. I reversed her going fast, I reversed her going slow; I gave her a little steam, I gave her a whole lot of steam, and I didn't give her any steam at all, but it was just the same; with the regularity of an eight-day clock, the steam permitted the piston to stop at the end of the stroke every time.

I have since thought that my failure should not have been altogether attributed to the plan of running the engine and giving her steam; it may have been caused by other reasons, notably, the great weight of the engine, improperly counter-balanced, which would be aggravated by the rods being removed from the disabled side, also the heavy train, which consisted of sixteen refrigerator cars loaded with meat and other perishables, this being the heaviest class of freight that is hauled. The brake was also poor; it was a vacuum brake and I could not graduate it, so I put it on full force, and before I could release it the engine was invariably stuck on the centre.

In the light of my experience, I am rather dubious about the advantages of "W. J. S.'s" plan, but would like to hear from some of the contributors to the Mechanical Department who may have had experience in a similar case. In conclusion, let me point out a wrinkle

to any one who may try the above method. If you plug your engine and she stops on the centre, don't forget to work the steam out of your cylinder with the reverse lever before attempting to pinch her ahead. If you don't do this you will have to overcome the resistance occasioned by the pressure of steam against the piston head, in addition to the weight of your engine.

*James Deegan.*

## THE DIFFICULTIES OF ATTAINING HIGH SPEED WITH THE PRESENT STYLE OF LOCOMOTIVE.

---

**MR. EDITOR:**—High speed seems to engage the attention of our progressive mechanics at present, and, in fact, it is a common thing in the United States to travel at the rate of sixty and seventy miles an hour, that is, for short distances, but to maintain a speed of over seventy miles an hour, I think, becomes impossible with the locomotives we are now using.

According to M. N. Forney, the greatest living authority on the locomotive, to run seventy miles per hour a locomotive with a six foot wheel must complete more than five revolutions per second, and during each revolution each piston and its connections must stop and start twice. As the speed of seventy miles per hour is not maintained regularly, how are we going to travel one hundred miles per hour with our present locomotives, as some of our experts predict?

Another obstacle is wind resistance, which becomes greater at high speeds; and again we must consider the wonderful velocity with which steam must get into the cylinders, exert the requisite power against the pistons and then get out without causing excessive back pressure in front of the pistons.

Too-contracted exhaust nozzles also cause back pressure by obstructing the free flow of exhaust steam; yet they must be more or less contracted so as to produce a blast through the stack to stimulate the fires.

It can be readily seen that when we attempt to remedy one defect we are brought in contact with another. Just how these obstacles will finally be overcome it is too early to predict; but I think that the traveling public will have to be satisfied with the present speed of our locomotives for some time to come.

*Walter C. Garaghty.*

BALTIMORE, MD.

# WOMAN'S DEPARTMENT.

---

EDITED BY IDA A. HARPER, INDIANAPOLIS, IND.

---

## ONE LESSON OF THE CAMPAIGN.

---

A significant feature of the campaign recently ended was the prominent part taken by women. A Woman's Republican Association was organized with headquarters in New York City, under the leadership of Mrs. J. Ellen Foster, a woman of great ability and powerful oratory. Auxiliaries were formed in many states, speakers were sent out and much hard work was done by Republican women in various parts of the country. In Kansas Miss Susan B. Anthony and Mrs. Laura M. Johns made a speaking tour over the entire state. Some work was done for the Democratic party by women, but we have been unable to find anything definite in regard to it. As a party Democracy has not been favorable to the idea of woman suffrage, New York being the only state in which the question has ever received a Democratic majority when brought to a vote in the legislature. When governor of New York Mr. Cleveland signed several bills, giving semi-political rights to women, and David B. Hill, when governor, and the present Governor Flower also have used their influence in favor of women. On the other hand President Harrison is said to look with disfavor upon woman suffrage, although it was granted by the Republican party to women in Kansas and Wyoming, and the latter state owes its admission into the Union with women suffrage as part of its constitution, to the Republican votes of the last congress, so the question cannot be considered as a partisan one.

The work of women in the Prohibition party is so well known as scarcely to need recapitulation. Their national conventions always adopt a woman suffrage plank, and the same is true of all their state conventions except in the South, which takes a conservative position upon this question. It is perhaps not an exaggerated statement to say that there is not a prominent Prohibitionist, either man or woman, who is not in favor of equal political rights. The vast majority of the party is composed of women and its most eloquent speakers belong to this sex. It is sometimes charged that this very fact is detrimental to the cause of universal suffrage, as neither of the old parties will be willing to enfranchise a great body of voters who will declare for prohibition. Be that as it may, it is a fact that the Woman's Christian Temperance Union has been the greatest factor ever known for developing the latent powers of women and showing their capabilities in hitherto untried fields.

The most conspicuous work done by women in the last campaign

was seen in the so-called People's party. No such a political canvass was ever made by a woman as that conducted by Mrs. Mary A. Lease. She spoke in almost all the states in the Union, making a tour from Puget Sound in the far northwest, to Florida, in the extreme southeast. She has been berated by the press of both the old parties and everything possible in the way of ridicule and abuse has been heaped upon her, with the exception that not the worst of her enemies has cast a reproach upon her reputation as a woman, and yet the chief argument of those opposed to women in politics is that their reputation would suffer. In contradiction to this argument the statement may be made that of all the women of all political parties who took a public part in this campaign, not one comes out of it with a blemish upon her personal character. Mrs. Diggs, Mrs. Todd, Mrs. Emery and many other women were prominent in the work of the People's party, which, as an organization, recognizes no political distinctions of sex, although naturally there is individual objection. Their national convention held at Omaha declared for "equal rights and equal privileges for men and women," and many of the state conventions incorporated a woman suffrage plank in their platforms.

In all the large colleges for girls throughout the country there was a deep interest in the political situation. At Vassar the Harrison and Reid club of two hundred young women had a great rally and parade with bands, speeches, &c. At Wellesley all political parties were represented among the girls by debates, speeches, parades, etc., and on election day they set up polls in the chapel and voted by the Australian ballot system. At Bryn Mawr the girls petitioned for lectures on protection and free trade, and distinguished advocates of both theories were invited by the college authorities to address them. These same things were done at girls' colleges throughout the land, showing the tendencies of women toward politics. A part of every university extension course, the members of which are chiefly women, is the lectures on political economy, and in all of our cities we find classes and clubs of women for the purpose of studying this science. The audiences of the political speaking during the campaign were so largely composed of women that it became a question in many places whether it was expedient to permit them to crowd out the voters.

All these straws show the blowing of the wind in one direction, i. e., the preparation of women to exercise political rights and a demand for this privilege, in the near future, that cannot be refused.

---

## THE WOMAN'S DEPARTMENT FOR 1893.

---

There doubtless will be general rejoicing among our readers to know that Mr. Debs will continue in charge of the MAGAZINE. His superior ability as an executive manager and his commanding talent as a writer are universally recognized within the brotherhood and widely known outside of it, but we, of the Woman's Department,

have especial cause for rejoicing. No truer friend to woman ever lived, no man who was readier to concede to them every right and privilege which he himself enjoyed and, in addition, to extend to them all the assistance and protection which a stronger can give to a weaker sex. In conducting this department he has been always in favor of the widest discussion and liberty of speech, and of granting all the space that the interests of the MAGAZINE would permit. It is, therefore, a most fortunate thing for the future growth and success of the Woman's Department, with its far-reaching influence, that our beloved MAGAZINE is still to remain under the control of our best friend, Eugene V. Debs.

We feel sure that all of our correspondents will place the good of the department above all personal considerations and that they will approve of the regulations that have been made for our guidance in the future. In the first place, all communications must be signed with the correct name of the writer, and this name will be published. This course has been decided upon to give more dignity to the MAGAZINE and to place on the contributors more responsibility. One who writes over his own name will be much more careful to do good work, and that is what we want. The MAGAZINE has passed beyond the period of anonymous communications. No exceptions will be made to this rule. We shall also have to be more discriminating, hereafter, in selecting letters for publication. We cannot be governed by personal feelings or by the wish to oblige. The letters must stand solely on their merits and the editor of the Woman's Department will be held to account for the judgment displayed in this selection. Our writers need not feel discouraged, but must make greater effort than before. We do not wish letters, but articles on some subject, with appropriate titles. We trust they will be written with ink upon respectable paper. We fully appreciate the attempts of our correspondents, but the interests of the MAGAZINE will be the first consideration and we shall use only what we believe will add to its value. Considerable leniency has been shown this month, but henceforth these regulations will be strictly observed, and we hope to have the cordial co-operation of both old and new contributors.

---

## OUR CORRESPONDENTS.

---

"Oleander," of Decatur, Ills., answers "Belle," and thinks leisure moments should be spent in writing letters, reading, making calls and discussing ways and means with one's household.—"Shorty," of Renovo, Pa., enjoys the MAGAZINE, and thinks the suggestions in regard to kissing are "immense."—"N. E. S.," of Logansport, Ind., uses too much space in describing her town. She thinks most of the women she knows are as capable of voting as T. W. H., of Sanford, Fla., appears to be, and she compliments highly the article entitled "Unvarnished Truth."—Mrs. O. H. writes from Centralia, Ill., speaking many kind words for firemen, who deserve the highest

praise.—“Maggie,” of Truro, Nova Scotia, has read the *MAGAZINE* five years and compliments Sunbeam Lodge, No. 171, of which her husband is a member.—Mrs. G. T. M. sends a long description of Leavenworth, Kansas, which we have not space for. Her husband is a devoted lodge man.—Mrs. Jones’ poem will appear next month.—Miss B. H., South Butte, Mont.: we cannot use obituary poetry.—“Carrie,” of Baltimore, Md., writes affectionately of absent husbands.—Mrs. L. W. K. of Lafayette, Ind., wants to hear more on the subject of corporal punishment.—“Sister,” of Atlanta, Ga., kindly sends a clipping entitled “Regard for Others,” which we cannot use for want of space.—“Minnie,” of Independence, Kan., is very fond of Mrs. Bloom’s verses and has read the *MAGAZINE* four or five years.—Mrs. George Gray, of Juab Utah, criticises Mrs. Fuller’s letter on Salt Lake City, referring to the public schools. She says the people could much better have afforded to pay tuition than the excessive taxes imposed by the Gentiles.—“Nora,” of Grand Junction, Colo., expresses the pleasure she finds in the *MAGAZINE* and glorifies the railroad boys.—“James,” of Detroit, Mich.: we regret exceedingly to be obliged to decline your article. It is written with much ability but is too long and is not entirely appropriate for the Woman’s Department. We will return it to you to use elsewhere if you will send six cents postage.—Mrs. C. W. L., Dearborn, Mich., we cannot use your article on “The Second Coming of Christ.” We do not consider it advisable to encourage religious controversy in the *MAGAZINE*. Send postage if you wish its return.—Thanks to Kennesaw Lodge, No. 247, for invitation to Thanksgiving ball.

---

## NOTES AND COMMENTS.

---

In a previous number of the *MAGAZINE* we gave an account of the World’s Fair Dormitory Association, formed for the purpose of affording cheap accommodations for women who attend the exposition. The chairman of this association is Mrs. Matilda B. Carse, who originated the idea of the great W. C. T. U. Temple just completed in Chicago, and is a woman of much executive force. She has just made her first report. The plan is to erect five of these dormitories, each large enough to accommodate 1,000 women. The buildings will be two stories high, each bedroom having outside windows and being comfortably furnished. There will be plenty of sitting rooms with open fireplaces. Shares of stock are \$10 each. The rates will be 40 cents for a day and night’s lodging. Thus one share of stock will entitle the holder to remain twenty-five days or two persons twelve and a half days. They can take their meals wherever it suits them. These dormitories are designed especially for women of moderate means, who are thus assured of cheap, comfortable and respectable quarters. Our readers should lose no time in securing shares of this stock. It can be transferred from one per-

son to another or readily sold if not used. The managers are all thoroughly reliable women and the association is incorporated. Address Mrs. Matilda B. Carse, chairman Woman's Dormitory Association, Chicago, Ill.

Among those persons in New York City who are worth a million dollars or more are 181 women. A careful estimate states that not less than five hundred million dollars of property in that city is owned by women. These women, of course, are heavily taxed and yet not one of them is represented. The vicious, the ignorant, the paupers, of the male sex can vote to impose these taxes, but the women who have to pay them have no voice in the matter. How long would men stand such injustice?

This issue of the MAGAZINE will greet our readers at the threshold of a new year. We have laid the almanac and the calendar of 1892 almost reverently upon the fire and watched them blaze up brightly and pass away forever. They are but typical of much that came in with the year and crumbled to ashes at its close, hopes, ambitions, loves, have failed to reach fruition. Cherished ones have passed out of our lives. The close of the year brings always a reckoning that contains the elements of sadness and regret. But the retrospect holds also happy memories and the new year finds us with the realization of many bright dreams and with much to encourage us to hope and work and be of good cheer. Life holds many compensations and, while the joys and sorrows are not evenly distributed, no existence is wholly unhappy and there is often trouble that the world does not know. We will be brave and cheerful and try to make for others a Happy New Year.

At the National W. C. T. U. Convention in Omaha thirty-five of the women delegates occupied the pulpits of that city on Sunday. It was enough to make St. Paul rise right up from his ashes and ask what has become of his famous injunction that "the women should keep silent in the churches." It still exists, Mr. Paul, but the men of to-day do not think of attempting to enforce it. There are yet a number of men like yourself, but there has been a big change in the women.

---

#### HAVE CHARITY.

---

If we could but read aright,

The secret thoughts of heart and brain,  
The earnest longings of the soul,

Our judgment we would oft restrain,  
Would cherish naught but a kindly thought  
For those with lives deep-sorrow wrought.

Could we beneath the surface look

Into each life, and there decry  
The deep, chaotic thoughts that surge

Within the breast would we not try  
To help assuage the heart's keen pain—  
From all reproaches then refrain?

WEST OAKLAND, CAL.

Could we but know of doubts and fears,

Of hopes deferred that fill the soul,  
The silent yearnings of the heart,

O'er which the waves of sorrow roll,  
A friendly hand we would extend—  
With deeds of kindness we'd befriend.

Into each life some hidden grief,

Has found its way with stealthy tread.  
All pleasures are allied with pain,

Our brightest hopes are soonest dead.  
Grief, joy and hope walk hand in hand,  
Throughout our broad and sunny land.

Nettie Bloom.

## LETTER FROM MRS. JONES.

The first snow of the season is falling in beautiful flakes—for the snow flakes are beautiful, notwithstanding so many writers and rhymers speak of them so sarcastically. The campaign is, in a measure, over again, to bloom forth in all its usual bluster and slander in ninety-six. I often wondered if Cleveland or Harrison were one-third as mean as the respective opposing parties made them out to be, why either of them ever got the nomination. If anyone wants to find out all about himself—his good or bad qualities—let him run for office. On the one hand, he will wonder if he deserves one-fifth of the praise his party is heaping on him; on the other, he will lie awake many a long night trying to remember if he really did *one* out of the hundred mean things attributed to him, and if so, was it from the paternal or maternal side of the tree his vices sprung, and he will determine after he is elected he will redeem all the disreputable actions of his ancestors, and while he is thinking over all the good he will do, the election is over and he finds the other fellow has got there. So in all our lives, we spend too much of our valuable time in thinking what we would do if only such a thing or the other thing would only happen, and time rolls on and we near the end of our race, and we look back and wonder at the few things we really have done to any good purpose. As the old song says,

If we only could live our lives over again,  
We would be such wonderful women and men.

It was my intention to have written a letter to the dear MAGAZINE as soon as I returned from my trip to Indianapolis, but sickness in the family prevented my doing so; also prevented my accepting the kind invitation to attend the firemen's convention at Cincinnati. This was a sore disappointment to me, but I was glad to find the convention survived it.

A great many of our readers have enjoyed Mrs. Harper's account of her trip to California, but few of our readers are aware of how suddenly her pleasant trip was brought to a close. Who knows what a day may bring forth? Mrs. Harper, starting on her pleasant trip like many of us have often done, anticipated a happy time and a safe return. Bidding adieu to her loved and loving mother and daughter, with a joyous heart and with the warm kisses of her loved ones lingering on her lips, with their prayers for her safe return sent fervently up to heaven, with a light heart, conscious of deserving her much needed vacation, she boarded the cars headed for the west, but after partly enjoying the beautiful scenery, and while thinking of her duties to our readers, in the midst of her pleasant journey—having just arrived at San Francisco, the message was speeding from Indianapolis on the same wires that have so many times brought a similar message to the wives or families of railroad men, and struck terror to the heart. Yes, dear Mrs. Harper received the sad message that her mother, her loved, her idolized mother, had received the summons to go on another journey from whence there was no hope of her returning to welcome home the fond daughter who was too far away to receive her farewell embrace or blessing. God moves in a mysterious way, so mysterious, indeed, that few of us, no matter how Christian-like we may try to be, we cannot at all times grasp the reason of why should these sorrows happen to us. Mrs. Harper left the party she was traveling with and returned home at once. My meeting with her is one of those great pleasures that occur to us sometimes in life, no matter how little we deserve them, and one which I would not, if I could, forget. Bravely struggling to forget, in a measure, her sorrow by hard work, she resumed her duties as soon as the dear mother had been laid in the city of the dead, and feeling that there is yet the great treasure of a young and promising daughter just budding into womanhood left to care for. Mrs. Harper performs her duties, if possible, in a more conscientious manner than ever, but the depth of feeling betrayed while speaking of her mother, and the love light that came into her eyes while talking of her daughter impressed me so deeply that I can never forget my visit to her. May our Heavenly Father be pleased to spare this loving daughter and mother to each other, I sincerely pray, and

L F M 6 Jan 98

may He who helped her bear that sorrowful return journey guide and keep them safely through life until they clasp again the hands of the mother so loved.

I cannot exactly understand why Mrs. Tewksbury can not put her fine clothes in the first boiler of water, and in this way it would surely do for the rest of the clothes without so much changing; however, as I cannot see exactly as others do always, I may be in much the same kind of a predicament as I was one day last week. I had a kind of a baking fit, or an inspiration for doing a good deal of baking that day. In my mind I could see pies and cakes and cookies and all *sich* coming out of that oven done to a turn. Well, I fixed my fire as usual and felt sure my usually good oven would soon be ready. When I thought the time was up I felt my oven, but it was as cold or nearly so as the proverbial ditch water. I raked and poked and poked and raked, all to no purpose; that oven was as contrary as the contrariest of us poor women are supposed to be. So I gave up in despair, deciding that it was another of fate's disappointments, and when hubby came home that evening I related my tale of woe and my great grievance. He says, in a man's brusque manner: "Must be something wrong in the fixing." I said: "No, sir, I fixed it just as usual." He stood up and looked at it about three seconds (I'll give him credit for just that time), when he remarked: "Does the elbow generally connect with the other top length of pipe, or do you leave an inch or so of space as an air hole, or ventilation or something of the sort? I see it happens this way just now." And would you believe it, my readers? I had been all day worrying with that stove just because I did not hold my head high enough to see my mistake. How many of the weaker sex have failed to hold their heads high enough to avert a far more serious mistake than this?

Well, "Irene," hubby says you are possessed of vastly more common sense than myself (complimentary, isn't he?) just because you advise me to get rid of that little Texas pony. He says I'll come home some day looking like the last rose of summer. Wonder will the pony have sense enough to stay away in the event of such a probability? With love to all,

*Mrs. Henry B. Jones.*

[Mrs. Jones, in her generous sympathy, has touched upon a subject on which I could not and can not speak. I appreciate her kindness.—Ed.]

---

## HOME TOPICS.

I have been an interested reader of the MAGAZINE for several years and enjoy the Woman's Department very much. I think if it improves as much accordingly in the future as it has in the past it will certainly be the peer of any magazine. I have three brothers who are railroad men.

I enjoyed Nora Bull's letter in the November number very much, and hope she will write again, soon. I do not believe in corporal punishment. Any child will obey much more quickly when commanded gently and kindly than when it hates the one in authority, for what other feeling can a child have for any one when in constant fear of punishment from them? Of course I do not believe in allowing a child to have all its own way, but do think a little kindness will do more good than punishment or threats of the same.

"A Fireman's Friend" asks for recipes. I send one for mince meat, which I believe to be excellent: Seed one pound of raisins and chop fine, one pound currants, the same amount of green apples, lean beef and suet, all chopped fine. Add one large nutmeg, one pound sugar, one-half teaspoon cloves, a pint of whisky and one-quarter pound lemon peel candied, and citron mixed. Do not put any water in. It is said this mincemeat will last a long time without becoming sour.

Sincerely wishing the MAGAZINE all prosperity, I am  
SAN ANTONIO, TEX.

*Ida Gregory.*

## CHRISTMAS THOUGHTS.

Christmas is now growing near, and many of our dear friends that were with us last year are gone—never to return to us on earth, and many of us who are well and enjoy life now, may be like them in another year, sleeping the last sleep that knows no waking, sleeping in the cold, cold ground, where the snow drifts and the cold fierce wind blows in winter and the flowers bloom and the little birds sing their sweet songs in the spring. They know or hear it not, for they are beyond all earthly things. Their griefs and sorrows are all past. We can go and stand around their graves which hold all that was dear to us on earth, we can plant flowers and water them with our tears, but it will do those who sleep below no good, but if we had said and done pleasanter things while they lived how much pain and heartache we might have saved them. We ought to think of this and act. Life is uncertain, we have no promise of tomorrow, and we know not what a year may bring forth. We cannot see into the future, but we can look back and see our past. We ought to so live that when we look back we could see no clouds, nothing to be sorry for or regret.

It is near Christmas and how many of us are going home to see our folks and friends. Think of your boyhood days—your schoolhood days, when at home as a boy you learned a mother's love and care; think of the pleasure and happiness you then had at your old home. You would like to go back to those good old days that are gone, would you not? Yes, I think we all would, but that will never be, we have grown older now, many of us have homes and children of our own to care for, and our young days are past never to return, so shall this Christmas be soon. We will have a Christmas once a year till the end of time, but this one will never return, so let us all improve the chance while we have it and go home. Your old mother would be pleased to see you; it would make her old heart glad to see her boy home again. Perhaps as you read these lines the cold wind may be whistling around the corners, the snow may be drifting deep and fast, you can think of that little parlor of your old home, a good warm fire burning, surrounded by father, mother, sister and brother and all the comforts of home. You would enjoy yourself if you were there, talking over old days.

While you would be sitting there you could look back and think of the other poor boys outfacing the storm on the road, with some old, leaky engine trying to make time. You could not sit and enjoy yourself and think of the brother who was out. Perhaps he was not so fortunate as you are, perhaps he has no home to go to. You may not have in another year, so go if you can. We ought to have a little pleasure here on earth, and make others happy at the same time. We are like the leaves of the trees, they come out in the spring, in the fall they drop and decay and in the spring others take their places. So with us we are here only for awhile, and then we will go and others will step in and take our places and the world will go on as before. We may be missed perhaps for a time, but it will soon be forgotten that we ever lived. We would be remembered longer if we had done something to be remembered for. So let us try and make the lives of others pleasanter if we can.

Some of the boys have no homes to go to but many of them have a lady friend or perhaps more than a friend. Go and see her. The little girl would be glad to see you. Let her know that there is one who does not forget her. We have many noble women in the world. Many of them are wives, daughters or sisters of some of the brothers of the B. of L. F. There is nothing like the love of a true woman or girl, one who can appreciate you, one who will work and help you through life. What a fearful world this would be if it was not for the woman's love, and the influence they hold over man. A woman or girl who prizes her honor and virtue, who has a spotless character is to be prized more by men than all else on earth.

I have often heard people say that the railroad men are the hardest class of people that could be got together. I say they are the bravest we can find. Their lives are always in danger but they do not stop for that. They go where duty calls. I have been with and around railroad men for some time. As a

class I find them men of courage, tender-hearted, kind and true, always ready to save the lives of others at the risk of their own. I am a fireman and belong to that noble order the B. of L. F., and I can see and study them and know what they are. If all men were as good as the railroad boys, as a class, they would be better than they are. So, ladies, stick to your fireman true, believe in him. He will respect a lady and treat her as such. When he steps on his engine he does not know whether he will ever get off alive or not but has to trust in Him that rules both land and sea, rules all things well. It is a pleasure to him to think—to know that he has some one in this great world who cares for and trusts in him. What advantage is it to a man to gain the whole world and lose his own soul? And what advantage to a woman to gain position and wealth and lose her own happiness. Look well to the true love and let wealth alone. All of our happiness comes from true love and our homes.

So let us all try to make this Christmas the happiest one of our lives, one that will be remembered by our children when we are gone, and try to make the next year that is about to begin, a little better than the one that is going out, do a little more good than we did in the past. We all had to creep before we could walk, and little things will grow. So as they grow let it be to grow better and greater. I shall bid you one and all good night, wishing you a merry Christmas and a happy New Year. Success to the B. of L. F.

#### A BACHELOR'S VIEWS.

Ft. Madison, Ia., is a very beautiful place of about 1,200 inhabitants, located on the bank of the Mississippi river, with vast lumber yards and mills, a number of manufactories of various kinds and three railroads. Nauvoo Lodge, No. 391, is located here with a membership of over sixty.

In looking over the *MAGAZINE* I see some one asked the question, "What shall we do with our spare moments?" I should consider this a very easy question answered, for there is any amount of good literature and one that is of an improving turn can always find something to occupy his time in some way that will be beneficial to mind, body and soul, and at the same time be no great labor. For instance, we will take the *FIREMEN'S MAGAZINE*, and one can find food for thought in the study of the different views that are presented there on the management of homes and work. Of course, as to the management of homes I have but a limited amount of experience, as I am not a married man and I live at a hotel, but then one does not have to be a very close observer to see how things are going at the right and left.

I must congratulate "Mabel" on her cake receipt that appears in the November number, for it suits my idea exactly, and I think it would be well if many would use it.

In regard to corporal punishment, I would say that we should conduct ourselves in such a way that if children imitate us they would require no punishment of any kind, and they are sure to follow the example set by older persons. I do not altogether agree with Miss Grace B. Cutler in her August letter on "Taxation of Bachelors," for I can say from experience that a so-called bachelor has enough to contend with without an additional tax imposed on him. I would like to hear the opinion of the readers on the subject, "Should a man marry with nothing but a job in view for support?"

I will close hoping that we all will enter the new year with better resolutions and purposes, and with the help of God I hope we may be able to carry them out. With success to the B. of L. F. I am

Yours fraternally,

FT. MADISON, IOWA.

A Bachelor.

## A WORD FROM A STENOGRAPHER.

Although an appreciative reader of the FIREMEN'S MAGAZINE, this is my first attempt at writing to the department. My uncle is a fireman belonging to "Just in Time" Lodge, 149, and it is through him that I owe my first acquaintance with this MAGAZINE. Of course in this large city the periodicals published are too numerous to mention, and although I subscribe for three, besides two stenographic magazines, the Firemen's is always a welcome addition.

I was much interested in reading in the November number a "Fireman's Friend's" description of Oklahoma City, where she resides. I presume she is a stenographer, as she desires to correspond with some lady similarly employed. I am a stenographer and typewriter and have done considerable work for lawyers in this city. I should think, in such a comparatively new city as Oklahoma, where there are "lawyers without limit," that the demand for stenographers would be greater than the supply.

We have not a few first-class magazines published in this city and Philadelphia in the interest of shorthand and typewriting, and one often finds some helpful hints, suggestions and interesting notes that keep one ahead of the times. I have just finished reading one which I found very helpful. I hope you will not think it out of place if I mention it, as I thought a "Fireman's Friend" would, perhaps, like to subscribe. It is the "Stenographer," subscription \$1.00 a year. Office, 38 South Sixth street, Philadelphia.

I was amused in reading of this correspondent's experiments in the culinary art, and am glad to know there is one stenographer who spends the time not occupied in forming hooks and curves or listening to the clickety-click of the machine, in preparing herself to be a real help-mate in her married life. I am afraid few young ladies employed in a similar capacity in this city are capable of making a loaf of bread which would not make their future "Johns" have a hideous nightmare, or could wash his flannels so that after going through the requisite processes they would not be a snug fit for a lad of fourteen. I wish "Fireman's Friend" success in her experiments, and happiness in her future life. I am sure she is going the right way about it, and has evidently found out that "the best way to a man's heart is through his stomach," and will agree with the poet, that—

"We may live without poetry, music and art;

We may live without conscience and live without heart;

We may live without friends; we may live without books:—

But civilized man cannot live without cooks."

NEW YORK, N. Y.

*Fireman Jones' Niece.*

## OUR DEAD HOPES.

Not the beautiful, lifeless clay, not the stilled form, lying so pallid and helpless there, with the waxen hands folded over the pulseless breast, the fair or dark tresses banded above the calm, white brow, the bright eyes whose pale lids are sealed with His sanction, closed forever, the look of great peace, blended with the smile frozen upon those rigid features! Not that.

The weariness is over, the long suffering gone. A whisper is wafted that, for this, there is something better—something beyond! A more full fruition—a completion of that begun; but "our dead" of blighted hopes, faithless trusts, and broken promises; idols we have worshiped at the shrine of our heart's altar. Ah! how poor the clay! The ceaseless toil of years; the labor of love, the dauntless hope, a looking forward to a single ray of light to lift the gloom! Weary eyes uplifted to the faint, far-away glimmer of the silver lining of yon sombre cloud! A passing zephyr, and the gleam is hidden. Stifling the moan, it is again "onward." Success is attained only through failures, persistence accomplisheth much, but again and again do "our dead" lie before us, and for these there is no resurgam. Tenderly, aye, reverently, we

lay them away with fold upon fold of annointed linen, and the ashes of rose leaves is scattered among, as it were.

Again, and now it is with an apathy akin to death that the thorn-pierced feet press on. Almost there, almost achieved; but like Dead Sea apples and the ashes of Sodom, it returns to us. A Barmecide feast! The labor and faith have been for naught. In sacriligious awe, the aching heart cries out: "Oh, Christ, was thy crucifixion more bitter; thy humiliation deeper? Have we not shed tears of blood? Have not thorn and spear pierced our brow and side, and have we not drank to the dregs the bitter cup of the gall of woe? It comes, at length, for the indurating process is a terrible one, and He can but pity, that one grows a little less than hardened. It is thus far and no farther. The limit hath been reached. Hark! "Into each life some rain must fall."

Afar in the interminable, misty distance, where the purple and gold are commingled, where the haze rises up from the summer sea, comes the soft murmur as of silver bells, whose cords are attuned to love and joy.

The cadence rises and falls, a rythmic chime, soothing the worn-out senses, as dew upon the parched plant! Ah! it hath not been all in vain! The discipline may have been needful. Yes, "our dead hopes" forever and ever. A silent clasping of pale hands, an upward glance, a suppressed breath, ending in a sigh. The old impulses quicken, but end in sublime resignation. Then again, with myrrh, rue and rose leaves, we lay them away, gazing down with dry, hot eyes and fevered pulse, and heart ready to burst its bounds with exquisite torture.

The sweet, subtle fragrance of the "might have been" mingles with the bitter aroma of the "never to be." And yet the continuous effort against all environments hath in it the courage of divinity.

It hath not been in vain, and "sometime, somewhere, and somehow," we shall know "the hidden reason of each dark and dreary hour," the whys and wherefores of it all.

There "our dead hopes" shall have no resurrection. The flat hath gone forth, and "we stand without the gateway as the *peri* at Paradise," looking with longing eyes for that we may never have. And ah! we cannot understand.

*Eiste.*

### REASONS FOR EQUAL SUFFRAGE.

It is over a year since I first attempted to write to the MAGAZINE, and seeing the subject of my last letter more fitly discussed and explained by abler writers than I am, I have since had no occasion to avail myself of the kind invitation of the editor to call again, but in reading the letters in the Woman's Department in the November issue, I came across one, signed T. W. H. to which I would like to make a reply, if you will kindly permit me to do so.

T. W. H. made the assertion, that, according to his mind no respectable woman would go to the polls to vote, or would hold public office, but he fails to state any reasons for his assertion. Probably he has none, and he is only repeating the utterance of persons opposed to every political reform, and unable to give any better reasons for their belief in man's superiority, than because Adam was created before Eve. Why should women abstain from voting? Are they not men's equal in intelligence and education? No one with common sense will deny, that the virtues necessary to honest government are developed to the highest degree in the average woman of to-day. Incessant care, comprehensive observation, intelligence, discretion, shrewd modification of details, perpetual deference to the hints of experience, are some of these virtues. If the application of human discoveries and the advance of the comfort and the convenience of modern civilization have been resisted as stoutly, as if they were a pestilence, it is not surprising that every political reform is ridiculed as visionary and denounced as incendiary. The challenge of conservatism to

the spirit of progress has this advantage, that it compels every change to prove its right by showing its reason. Whatever man does, he is more or less inspired to do, by selfish motives. Man had the ruling hand since ages unknown, and it is not much wonder, when, now his scepter is in danger, he tries by all means, right or wrong, to save it. The most popular reason for the objection to woman suffrage seems to be, that women lose their natural charm, by becoming too independent. That this is only a delusion, is conclusively proven, in different states, where woman's rights exist. For instance, take the state of Kansas, where they have municipal suffrage, or Wyoming, where they have full suffrage, and you will find that women there are held in greater respect than ever. Even if physically weaker, by proper cultivation and co-education, and through the ability to earn money by entering in various occupations, women will gain that financial independence; which will enable them to take care of themselves, and it will remove the temptation to marry in order to secure support. Another proof of the fallacy of the theory, that women lose their charm by becoming independent, is this, that men, when looking for a life partner, pass by the helpless and dependent girls, and make their choice from among those, who accomplished and educated, demonstrate their ability to take care of themselves. There is hardly any sound reason men could advance, why women should be denied equal rights with men. There are very few men to-day, who will deny the justice of women's suffrage, but the fear of being ridiculed by some of their friends, and the uncertainty of the final result of this great problem, keep them conservative.

Remembering the warning of the editor to write letters as short as possible, and hoping that abler writers than myself will express their opinion on this subject, I give my best wishes to the Woman's Department and say

*Auf Wiedersehen.*

[We are glad to hear again from our German friend, and from our point of view his arguments are sound. When he writes again he must give the readers the benefit of his name.—ED.]

---

### ONE WOMAN'S EXPERIENCE.

I have just finished reading the MAGAZINE, and having a few spare minutes will enter your social circle. I am alone, as I write, but expect every minute to hear that most welcome sound, the whistle that says to me "you know," and indeed I do know that it is my fire-boy safely returned to me again, and the words spring from my heart, "I thank Thee, O, God." Do all the sisters send a prayer after the dear ones as they leave to go to their dangerous duty? Whenever my boy leaves me, with his cheerful smile and "Good-bye, Dearie," I never fail to send a prayer after him for a safe and speedy return.

Now I hear some one say, "She must be an old, long-faced, sanctimonious woman." But I am not; I will not say just how old I am, but I have been married several years and have a most interesting family, and each day find some good, new quality in my hubby.

I perfectly agree with "A Fireman's Wife," from Ft. Erie, Ont., on this "Employ Help" question. I do every bit of my own work and do it while my boy is out on the road, with the exception of the washing; and as I have a washing machine and wringer, he says he can run them better than I can, so I let him do it, and all I have to do is to put the clothes into the washer and hang them out. I think it perfect laziness for any able-bodied, railroad man's wife, who can eat three hearty meals a day, to keep a servant, and she loaf around in artistic idleness while her husband is out doing such hard work as falls to the lot of firemen. I believe in a wife being a companion and helpmeet to the husband, instead of a dead weight on his hands.

I never had house work to do before I married, but I knew how, and am now very glad I did. We run our house on the cash system and find it much the

better plan; we did not begin that way, we could not, for we had not \$100 to begin on. We went right to housekeeping and bought everything on credit, and by our economy we were soon out of debt, and now have a snug sum laid aside for a rainy day. We did not furnish our house as befits millionaires, but as suited a young couple who had nothing but what they made for themselves.

Now, young people, let me advise you, if you are using the credit system, if you cannot commence paying cash for everything, commence on your meat bill and pay for it as you get it, and you will get better meat and also be served better, and after a while you can pay cash for everything you get.

Besides doing my own work, and tending babies, I find plenty of time for fancy work, reading, music and painting, and will say I am not the only economical one of this firm, for my boy neither drinks, smokes nor chews, and spends every evening at home with his family, and I only wish all girls could get for husbands as good a fire-boy as I did.

I will tell you of a very pretty work basket I made for a young friend of mine. I took a small grape basket, gilded it and then made a padded lining for the bottom and sides, of blue silicia, using plenty of satchel powder. Over the blue lining I put a fullod cover of lace-stripe scrim, and finished the top edge with a fall of cream lace. A blue bow on the handle completed a very useful and ornamental gift. I must not forget to tell I made a cushion and thimble pocket of blue, covered with the scrim, and fastened them in with bows of ribbon. Bidding a kind good-bye to all the B. of L. F. and the MAGAZINE, I am,  
ROODHOUSE, ILLS. Pansy.

[Such prosperity and happiness as are here described are only possible where both make the effort. Neither the husband nor wife alone can create a happy and prosperous home. It must be a joint production. Sign your own name next time, or your letter will not be used.—Ed.]

### CASTLES IN THE AIR.

Last night as I sat down to rest,  
After the day's work was o'er,  
A sweet peace came stealing over me,  
As I'd seldom known before.

I thought of possessions all my own,  
Friend's, a snug bank account,  
A lovely home, and several farms  
Which rent for no small amount.

My mine at Cripple Creek "panned out"  
Beyond my greatest thought,  
And the "Futurity stakes" were won  
By the 2:10 horse I bought.

Every venture that I made,  
It seemed, would turn to gold,  
Until my possessions had increased  
To more than a thousand-fold.

But the greatest blessing of all  
That to any one could be,  
Was the love of her who was dearer  
Than all the wide world to me.

COLORADO CITY, COL.

And sweet little Madge, our first-born,  
As I stroked her sunny head,  
Lisp'd: "Won't papa please tiss me 'dain,  
"Tause I has to do to bed?"

I pondered long the reason why  
That I so blessed should be,  
While those who were more deserving far,  
Had naught but adversity.

Then a rude awakening came,  
My dream was quickly o'er,  
For I heard the caller's gentle voice,  
While he pounded on the door:

"Houlihan! get up right away!!  
You're wanted to go through  
On train thirty-three, at twelve o'clock;  
It's now eleven twenty-two!"

Wife, child, friends and fortune  
Have vanished, all in one.  
Only I am left—a poor, lone fireman,  
On a lonely midnight run.

Pat Houlihan.

# THE MAGAZINE.

PUBLISHED ON THE FIRST DAY OF EACH MONTH,  
AT TERRE HAUTE, INDIANA.

TERMS—ONE DOLLAR PER YEAR IN ADVANCE.

## THE LABOR PRESS.

*The Railroad Trainmen's Journal* for December has an editorial article on "Immigration," in which it advocates shutting the doors of the Republic to immigrants. Speaking of the character of immigrants, the *Journal* says:

The most undesirable class is the one we get. While the Chinese have been excluded there has been very little attention given to the almost barbarous hordes coming from Italy, Poland, Russia and Hungary. They come by the ship load, a vicious, ignorant, pestilential mob, without notions of citizenship, without the first desire to become citizens, but filled with an all absorbing desire for the American dollar and knowing this to be a free country they mistake liberty for license and act accordingly. Their governments are within themselves to a great extent, and a generous percentage of them know no rulers but the leaders of the Mafia and other kindred societies. This is the class that has accepted the invitation to come and dwell among us. They have come and we are the sufferers.

The *Journal* introduces an article from the *Chicago News-Record*, which intimates that Secretary of the Treasury Foster can properly settle the question, as follows:

There will be little regret on this side of the Atlantic over the announcement that Secretary of the Treasury Foster will presently issue an order forbidding the entrance of all immigrants who come as steerage passengers. The conditions of the order leave the way open for the occasional immigrant who may be sorely anxious to enter. If the inducements bringing him are strong enough he can come by paying cabin-passenger rates. For the multitude of others the order will, of course, be virtually prohibitive of entrance.

We think the subject is to be widely discussed and the *MAGAZINE* may take a hand in it; but if Mr. Secretary Foster is clothed with power to shut out steerage passengers and admit only cabin passengers, that ends it for the present. It is certainly a novel idea.

The *Journal* of the National Association of Machinists for December has a ringing article in favor of organization, from which we extract the following:

If there ever was a time in the history of organized labor when it needed thorough organization it is now. Don't wait until it is too late and then try to do what should be done at once. The employers of our country are already talking of reducing wages. The experience of labor in this country, and in fact in all countries, has been that only by close and thorough organization can we hope to get an advance or keep our present wages where they are. The same old story will be preached to us about values as they did about supply and demand, and if we are not alert and able to show a bold front, advantage will be taken of our indecision. The result will be the same old story—organized capital against unorganized labor. The result can be foreseen by the most obtuse. Now is the time, fellow machinists. Attend the meetings of your lodge, pay your dues promptly, and by your good example generally you will induce others who have been backward to come forward and help in the good cause. Every element and force at the command of our employers will be brought to bear to crush our unions. The hope will be entertained that we will prove more subservient to our masters.

Now, brothers, one and all, it becomes our duty to prove to the world that there is sufficient manliness in us to stand up for our organization, as only through it can we ever hope to hold what we have gained or attain future concessions. On the other hand, if we strengthen ourselves and manifest our knowledge of the best course to pursue to protect our rights and have the courage and manliness to proclaim them, we will be shown more respect.

Dan. B. Honin, of the *Railway News Reporter*, writes of Jay Gould, as follows:

By the death of the great railroad king, railway employees of every kind have lost a true and tried friend. On every line which he has controlled the standard of wages has been highest; on those lines encouragement has been given employees and as a result nearly every officer of the entire system of railways owned or operated by Gould capital is a man who has come up from the bottom. It was such treatment toward the great army of men in his employ that endeared him to all of the fraternity. The writer has worked under his management and on his lines, and of all the successful and happy days of his railway life that he recalls, those spent on the Gould roads were the happiest. We believe that the great fraternity of railroaders will exclaim with one accord, "Peace be to his ashes." His death, while not entirely unexpected, was a great shock to all. For and in behalf of the fifty thousand men in the west and south who daily serve in various capacities on the Gould system of roads the *Railway News Reporter* desires to express to the sons and daughters of our honored dead the fullest measure of sympathy in this, their hour of sorrow.

It is most agreeable in the midst of storms of detraction to hear some one who has worked on Gould's railroads, bear testimony that whatever else may be said of Jay Gould, he treated the men in his employment in a way to win their friendship and esteem. Jay Gould was not an angel, and what's more, he never pretended to be. He skinned bulls and bears, he scalped gamblers, but he did not rob workmen.

The *Union Pacific Employees' Magazine* for October has a capital article on bigotry, "mankind's greatest curse," in which it is said:

Bigotry is the most effective weapon the enemies of social advance can use. Set it to work, and it accomplishes the object without any further attention. It seems to be the biggest stock in trade among workmen. It is better than dynamite to the wreckers of labor organizations. All that is necessary is to start a rumor, and at once it is at work. There must be at least two breeds of it, and the parties interested in preparing the explosion will see that they are there represented in fair proportions.

An eminent and eloquent Irish barrister once said:

"But to what end do I argue with a bigot? a wretch, whom no philosophy can humanize, no charity soften, no religion reclaim, no miracle convert; a monster, who, red with the fires of hell, and bending under the crimes of earth, enacts his murderous divinity upon a throne of skulls, and would gladly feed, even with a brother's blood, the cannibal appetite of his rejected altar! His very interest cannot soften him into humanity. Surely if it could, no man would be found mad enough to advocate a system which cankers the very heart of society, and undermines the natural resources of government; which takes away the strongest excitement to our duty and closes up every avenue to laudable ambition.

The *Union Pacific Employees' Magazine*, for December, has a leading editorial captioned, "Labor Interests after the Election." The writer does not seem to be satisfied with the way the land slid, November 8. The trouble seems to be that the New York Chamber of Commerce gave a banquet which was attended by several distinguished (?) gentlemen, among them Grover Cleveland. Whereupon the *U. P. E. M.* says:

Men have got to be educated in what their rights are, and how they can be protected. After an election is always before another election, and it is at an election alone that practical steps are taken. It is during that period that preparations must be made. We should take example from the acts of the privileged classes, be united before, at, and after all elections. Seek the abolishment of those social conditions that overload the banquet table, while the table of a single toiler remains bare. It can never be while the sitters at the banquet table are allowed special privileges, or while the toilers believe they have any political interest in common with them, or can be furthered by delegating political power to them or their agents. We have been fooled long enough by their seeming opposition before election, and their banqueting after election. Let us rally to our mutual interests now before another election.

The *Western Laborer*, published at Omaha, sent forth No. 1, Vol. 1, Nov. 19, 1892, with Mr. Arthur L. Nelson in charge of the editorial faber. Its salutatory is captioned "Our Mission," in which it says:

In placing *The Western Laborer* before the public, we wish to distinctly and emphatically state that it has not now and does not desire to have a political "pull." This paper will always be strictly non-political and non-sectarian. It will devote its whole attention to matters which are of interest to organized workmen, and will ever, to the best of its ability, exert itself to aid their cause in all ways. Wherever and whenever organized labor is making a fight for its rights you may expect to find the *Laborer* doing its level best, and you will not be disappointed.

We congratulate organized labor of Omaha

upon its good fortune in having another champion in the field to promote its welfare and defend its rights. If the "pen is mightier than the sword" the time is at hand to test its superior might. Under plutocratic rule the sword is drawn—labor has no sword, only its pen—and we wish the pen of *The Western Laborer* a succession of brilliant victories.

We take it for granted, from the following, which appears in the *Telegrapher*, that the grand officers of the O. R. T. have their hands full of business and are not likely to be killed by rest and rust. The *Telegrapher* says:

We know that our grand officers, were such a thing possible for them to do, would be only too glad to schedule every line of railway at once, but there must be reason in all things. While it is conceded that all are anxious to see the betterment of their own line, yet they must take into consideration the fact that our grand officers are not made of iron and steel, but, are flesh and blood and will wear out. At this writing there are seventeen calls for our Grand Chief Telegrapher to come at once, and still proposed schedules being presented. At the least calculation it will take him the coming three months to adjust the grievances now approved and on file.

Manifestly, the telegraphers are wide awake and intend bettering their condition, and the *MAGAZINE* wishes them every possible success.

The *Trackmen's Ballast* for December, has an article captioned "Plain Talk" by the editor and Grand Master of the Brotherhood of Railroad Trackmen. Brother Gunn is a marksman and no mistake. He says, addressing trackmen of the brotherhood:

Two years ago next March we quit a job on the Michigan Central railroad that would have paid us \$75 per month. We started this work with \$600 in cash. The printing has cost \$700; traveling expenses, \$500; postage and stationery, \$400; rent and books, \$250; board, \$350; help, \$400; clothes, \$300. Total expenses, \$2,900. We have realized \$300 from the *Ballast*; from initiation fees, \$1,300; Grand Lodge dues, \$700. Total, \$2,300. Stop and consider: Supposing we had remained on the road, loaned our \$600, interest to date would have been \$672. Our salary would have been \$1,500. We could have saved \$36 a month for twenty months, which would have made \$700 and to-day would have had \$1,372. Have we done anything for you or have we tried to? Can you find any man in the whole country who will ever do that much again? If you can, show him to us.

That's it, Bro. Gunn, you are laying up treasures in heaven.

The *Switchmen's Journal* for December refers to the rumor that a great railroad strike would take place during 1893, as having emanated from Joseph Heimerle, of Buffalo, formerly a member of Buffalo Lodge, No. 59, of the S. M. A. A. The *Journal* says Heimerle "has no means of knowing what the organization intends to do and what he claims is the purpose of the organization is at va-

riance with a policy that has guided the S. M. A. A. for years. Even were this not so it is a sorry opinion that people must have of the wisdom of the membership of the S. M. A. A. If they believe that if such a plan was adopted it would be heralded to the world six months in advance, placing the organization in the attitude of the aggressor, whereas it is known to resort to strikes only as a final means of self-defense, and courting defeat by bringing down upon itself the execration of the public."

*The Advance Advocate*, official organ of the International Brotherhood of Railway Track Foremen, in its December issue publishes McLeod's iron clad contract with men who work on the Philadelphia and Reading railway, and remarks that "it is high time that something was being done to put a stop to such requirements being imposed upon the laboring classes of this free America, and when we reflect upon such treatment we cannot refrain from saying it is no wonder that such men as Bergman are not more plentiful in the State of Pennsylvania. For such men as McLeod and Frick would almost drive sensible men to commit acts that nothing less than the gallows would be their penalty." Yes, the McLeods, Fricks, Streators, *et al.*, seek to degrade men, and men made desperate by degradation early become criminals.

*The Age of Labor* refers to an episode in railroad affairs in Chicago, as follows:

The engineers who were discharged from the elevated road for "holding a meeting antagonistic to the company's interest," are now hunting for work. Mr. Arthur was appealed to and came to Chicago to investigate the case, but finding that the men had broken a rule of the company they were left to their fate. It appears that these engineers had called a meeting of the enginemen and trainmen for the purpose of having an understanding about mutual protection in case of any danger threatening them. The company heard of it and hunted up a rule that forbids such meetings. The men responsible for the meetings were summarily discharged and Mr. Arthur apparently approves of it—employees must not break rules. This will not surprise anybody; not a bit more than that corporations should make rules to deprive employees of a right guaranteed by the constitution of the United States.

There is one way to have peace with the plutocrats, and that is to let them have their own way.

*The Brass Worker* for December refers to the "compulsory benefit systems" as follows:

The powers that be in many shops and factories have introduced compulsory benefit systems to counteract the benefits that organizations offer to their employees to join their ranks. It is a good paying scheme for the promoters but a costly one for the men, as the moment a man quits or is discharged from the shop he loses all the money he has paid in. It should be easy for the men to realize that there is no comparison between the shop benefit systems and the benefits that are paid to the members of the brotherhood, no matter where they may travel.

Manifestly the brotherhood system is the most desirable from any point of view, since it does not tie a man down either to shop or locality—in a word, does not deprive him of his liberty.

*The Railway Shop Employee* for October, referring to the switchmen's strike at Buffalo, remarks:

But what does it matter to the governor and sheriffs of New York whether a labor organization or its members are orderly or honest law abiding citizens, if their cause be just or not, whether women and children are dying in want of food and other necessities of life, when the command from Wall street comes for troops, it must be obeyed to the letter without hesitation or thought as to whether it be for the best interests of the people to send out an army of 10,000 armed men under command of an Arnold, it is and must be done; for Wall street can furnish the blood money necessary at any political campaign if it be necessary in spite of labor organizations to place at the head of the state and county executive offices, such tools as will obey at a moment's notice the command of the strongest enemy our country is cursed with to-day, and all these crimes under legal authority and protection of law.

*The Railroad Telegrapher* of December 1st remarks that "the Order of Railroad Telegraphers is fast becoming one of the greatest labor organizations in the country—numerically, financially and beneficially. Surely, the railroad telegraphers have reason to feel proud of their organization. What was considered an impossibility seven years ago is now accomplished, but we should not stop here. Let the good work go on until we become the strongest and greatest organization of railway employees in the country. It will not take long to accomplish this now."

*The Trainmen's Journal* for October, has some very pointed comments upon the attitude of the daily press towards organized labor, particularly, when a strike occurs, when there is a demand for honest representations of condition. *The Journal* says:

On every occasion of trouble between capital and labor it seems to be the whole desire of the press, with some honorable exceptions to distort facts and make the reading public believe that workingmen interested are little short of fiends and entirely given to rapine, incendiarism and murder. It represents them as given to every form of lawlessness and classes them with the worst element of society imaginable. In short, it shows its venality from the start of the trouble to the finish.

EDWARD HURLEY, a member of Division No. 253, of the Brotherhood of Locomotive Engineers, has purchased an interest in the Atlantic Hotel, Chicago, and advises us that arrangements will be made to give members of the brotherhood and their families visiting the World's Fair a special rate, as also first-class accommodations. The hotel is located on Van Buren street, corner Sherman, and is opposite the Rock Island & Lake Shore depots. Communications in reference to rooms and rates will be promptly answered. Brother Hurley assures us that he will give special attention to railroad guests.

## A SPLENDID CHANCE FOR MAGAZINE AGENTS TO MAKE MONEY.

At the late biennial convention of the brotherhood at Cincinnati, September, 1892, a law was enacted giving Magazine Agents ten per cent. of all paid up subscriptions they obtain, provided the number of subscriptions is not less than ten. A glance at the territory embraced in the jurisdiction of the order, the number of great cities it includes, at once demonstrates that the opportunities afforded for the agents to make money are exceedingly favorable.

The purpose of the law is two-fold. It is designed to compensate the agents for extra efforts to obtain subscriptions—and by extending the circulation of the MAGAZINE, to promote the usefulness and influence of the order.

We do not hesitate to assert that the MAGAZINE will come fully up to any prudent estimate of its standing in the list of similar publications of the country. It has for a long time been in the lead of them all, and has met the most exacting demands of the order. Hence, Magazine Agents are not required to make apologies for the MAGAZINE, but may with entire propriety, refer to its various departments and challenge comparisons with other labor publications.

For every ten subscribers an agent obtains, he receives \$1.00, and if a hundred are secured, his per cent. amounts to \$10.00, and by exercising diligence, a sum may be earned that would make the pay for the time employed a good investment.

With these remarks we take the brotherly liberty of urging upon the Magazine Agents zealous work in extending the circulation of the MAGAZINE, and the more money they make by their efforts, the greater will be our gratification.

## STRIKE ON THE DENVER & RIO GRANDE RAILROAD.

The history of the strike on the Denver & Rio Grande R. R., which occurred October 15, 1892, is on our table, compiled by the officials of the road, and being documentary throughout, must be accepted as correct. The order which led to the strike was as follows:

SALIDA, COLO., August 22, 1892.

*Conductors and Enginemen, Second Division:*

Train and Enginemen on trains 61 and 64 must not detain their trains to get meals at Malta or Glenwood.

On leaving terminals you must go prepared to go through, as these trains must make time.

(Signed) R. M. RIDGWAY, Superintendent.

We have no desire to comment largely upon this ill-advised strike, in which there seemed to be a purpose to avoid a settlement by arbitration.

An engineer by the name of William Gor-

don, refused to obey the orders of the Superintendent, and left his engine; for this he was suspended 30 days, then a demand was made for his reinstatement, and if not granted a strike was to result and did result. The MAGAZINE is fully of the opinion, that in this case, the men, by refusing an offer to arbitrate the difficulty with the officials of the road, acted injudiciously, and the MAGAZINE does not indorse that sort of a strike. It is quite probable that the order of the Superintendent was hasty and should have been modified, but it was not of a character to warrant a strike, which could easily have been avoided if engineer Gordon had exercised ordinary forbearance. Manifestly, if that sort of a policy is to prevail, utter demoralization in railroad affairs would be inaugurated. We hold that a strike should be the last resort, and inasmuch as certain employees on the D. & R. G. ignored that idea and refused overtures for arbitration, they were clearly in the wrong.

## FOR COMMISSIONER OF LABOR.

Geo. E. Gunn, Grand Master of the Brotherhood of Railroad Trackmen, is prominently mentioned as a candidate for the office of Commissioner of Labor for the state of Michigan, and his many friends are actively urging his claim to recognition. The *Charlotte Tribune* refers to Bro. Gunn in the following complimentary terms:

The *Tribune* notes with pleasure the fact that Mr. George E. Gunn, of this city, is a candidate for the office of Commissioner of Labor for this state. Certainly Mr. Rich could not find a better man for the position, and his appointment would go a great ways towards satisfying the labor organizations of the state that the republican party has practical sympathy with those who toil. The *Tribune's* position has always been that appointments should be made because of some special fitness for the place, and the fitness of Mr. Gunn is emphasized by the fact that labor organizations all over the state are petitioning for his appointment. For the past nine years, ever since he was a boy, he has been identified with labor movements. He has put his time and means into the up-building of the order of Railroad Trackmen, an order composed of the hardest worked and poorest paid men in the country. He desires this place for the benefits he could accomplish through it for laborers.

The MAGAZINE gives its hearty endorsement to Brother Gunn, believing him to be, in all regards, eminently qualified to serve the state as Commissioner of Labor, in which position he would have opportunities for the full exercise of his abilities, while he could doubtless be of great service to the cause of labor, to which he has devoted his time and energies, with such excellent results to his constituents. The MAGAZINE is always ready to endorse a representative workingman for a position of responsibility, and in this instance, the applicant is so well qualified that the testimonial is given not less as a duty than as a matter of satisfaction.

## SUNDAY CLOSING OF THE COLUMBIAN FAIR.

The indications are now cheering that the fanatical craze to close the Columbian Fair on Sundays, has about spent its force, and that the long-haired men and short haired women will be required to take a back seat. We have received from the Chicago Trades and Labor Assembly the form of a petition to Congress, asking for the repeal of that portion of the act which prohibits the admission of the people to the grounds and buildings on Sunday. The petition is as follows:

### PETITION TO CONGRESS TO OPEN THE GATES OF THE WORLD'S FAIR ON SUNDAY.

To the Senate and House of Representatives of the United States in Congress Assembled:

The undersigned members of the great industrial portion of the population of this nation respectfully petition your honorable body to repeal such part of the acts of Congress pertaining to the World's Columbian Exposition which prohibits the admission of the people to the grounds and buildings on Sunday.

We believe that the interests of the masses will be subserved by an open Fair on Sunday and that no harm can be done the people employed therein, since the Board of Directors agree that the labor of employes shall be limited to six days per week.

NAME.

ADDRESS.

Every lodge of organized workmen throughout the country should address T. J. Morgan, Chairman, Room 211, Herald Building, Chicago, and obtain a petition, secure signatures and promptly forward the same to a member of the national house of representatives or to a United States senator. No time is to be lost. Let the work be thoroughly done and Congress will heed the demand of the petitioners, and multiplied thousands will be able to derive some pleasure from the great exposition, which otherwise will be a sealed book to them.

## TRAVELING ENGINEERS' ASSOCIATION.

Preliminary steps to organize an association of traveling engineers or road foremen of engines have been taken, and the indications are that the movement will embrace representatives of all the railway systems in America. The association is to be educational in its influences and, properly directed, will be fruitful of large benefits both to its members and the companies they serve. A call for a meeting to be held at New York on January 9th has been issued as follows:

At a preliminary meeting held at Chicago, Ill., Saturday, November 12th, the following call was decided upon and is hereby issued:

We, the undersigned road foremen of engines, or traveling engineers, deeming that an association of men in our calling would be beneficial in that an exchange of ideas would tend to uniformity in our work, and to widening our information and usefulness, and, if properly conducted, would make

the position of traveling engineer recognized as one of great usefulness to railroads and engineering. It would prevent friction by promptly rectifying small abuses; prevent waste by conducting a practical education and the encouragement of economical practices.

We ask all traveling engineers and road foremen of engines to meet for the purpose of organizing an association similar to the Master Mechanics' Association, said meeting to be held at 2 P. M., Monday, January 9, 1903, at room 912, No. 6, Beekman street, New York City, office of *Locomotive Engineering*. If this meets with your approval, will you kindly correspond with John A. Hill, at above address, at your earliest convenience, stating if you will be present, or if not, if you will join the association.

C. B. Conger (chairman), C. & W. M.; W. O. Thompson (secretary), L. S. & M. S.; J. S. Boder, L. S. & M. S.; W. A. Pitcher, P. & L. E.; T. J. Hennessey, Mich. C.; M. Mast, C. & E.; W. T. Simpson, C. & G. T.; A. H. Polhamus, P. R. R.; John King, P. R. R.; A. S. Work, N. Y., C. & St. L.; N. S. More, C. & N. W. W. A. Murdock, C. & N. W.; W. A. Anthony, C. & N. W.

The MAGAZINE is greatly interested in the movement and in succeeding issues will record developments which, it is to be hoped, will be in the line of success equal to expectations.

## A NOVEL LAW POINT.

Under the above caption the *Eight Hour Herald*, of Chicago, publishes the following, which should be read by all men who are interested in the success of organized labor:

The publishers of the *Eight Hour Herald* control the advertising of certain theatrical programmes, one of the solicitors for which recently brought in an advertisement for the notoriously non-union Columbia Cigar Factory, having contracted to publish it for several months. The electrotypes and contract were immediately returned to the cigar firm, with the information that no business relations were desired with employers of their class. The firm, however, refused to receive the electrotypes, copy, etc., and after a bitter denunciation of organized labor in general, and the Cigar Makers' Union in particular, announced their intention of procuring an order of court to compel the insertion of their advertisement.

In answer to an inquiry as to why they refused to pay the cigar makers' bill of prices on the "Buck" cigar, the inquirer was gravely informed that they could not afford to, as their customers were chiefly jobbers, but how several hundred other employers in Chicago were enabled to pay the bill on the same class of goods was not explained. There was just a grain of truth, however, in the next statement vouchsafed, that "the working people didn't care whether the label appeared on the cigars or not—they would smoke them just the same." And organized labor was specially invited, in language more forcible than elegant, to do its worst to injure the sale of the "Buck" cigar. How would it be for the Federation of Labor, at its annual convention at Philadelphia next week, to accept the invitation on behalf of its 600,000 constituents?

The factory number, which is burned in every box of the various brands of the Columbia factory, is 6, First District Illinois. Perhaps your druggist, barber or tobacconist handles the goods—you might inquire. An absolute guarantee of non-union workmanship—the absence of the blue label—goes with each box.

And another novel law point will be that as to whether organized labor can accept the Columbia Cigar Factory's invitation to "do its worst" and not be accused of boycotting.

The proper thing for workmen to do in this case is to refuse to smoke the Columbia Factory's cigars, or, better still, buy only such cigars as bear the union label.

## THE GRAND TRUNK RAILROAD OF CANADA.

It always affords the MAGAZINE special satisfaction to record the liberality of railroad officials when dealing with their employees. A case in point is the course pursued by General Manager Seargeant and Mechanical Superintendent Wallace, of the Grand Trunk Railroad of Canada, in adjusting the pay of firemen on their line, one of the most important on the continent.

In conferring with the Firemen's Joint Protective Board, the pay secured by the firemen is 57 per cent. of engineers' first class pay, and the schedule gives entire satisfaction. The advance is equal to \$65,000 a year, and the arrangement, which is for two years, goes into operation on the first day of January, 1893.

The outcome of the conference with the railroad officials reflects the highest credit upon the members of the Joint Board, who exhibited consummate prudence throughout the negotiations. They were met by the officials of the road in a spirit of fair play, and we predict for officials and the firemen two years of harmonious work, alike creditable to all concerned, an illustration of what might be accomplished on all roads where the purpose is to live and let live.

In addition to the increase of wages, classification was abolished, which makes the adjustment all the more gratifying.

We congratulate the members of the Joint Protective Board upon the success of their labors.

## AWARD OF MAGAZINE PRIZES.

Name of Ag't.	Name of L'dge	No. of Lodge	No. of Subscribers.	Amount Received.	Amount of Prize.
T. J. Roberts	E. C. Fellows	143	165	\$165 00	\$100 00
E. P. Curtis	Alamo . . . .	263	155	155 00	50 00
J. O. Dart	Orange Grove	97	148 1/4	148 25	. . .
E. B. Williams	Gre't Western	24	127 1/2	. . .	. . .
E. S. King	Rose City . .	45	124 1/4	. . .	. . .

It will be observed that Brothers Roberts and Curtis carry off the prizes for 1892, and that Bro. Dart was close after them, while Brothers Williams and King make highly respectable showings. Most heartily do we congratulate Brothers Roberts and Curtis upon their good fortune, nor are we less inclined to commend the good work done by Brothers Dart, Williams and King for the interest they manifested in the welfare of the MAGAZINE, and while Brothers Roberts and King have won the prizes the rank and file of the brotherhood will not forget the good work of the three Magazine Agents who secured four hundred subscribers.

## THE IRON CLAD CONTRACT.

The readers of the MAGAZINE ought to know the kind of a contract men are required to sign if they would obtain employment on the Philadelphia & Reading R. R. The contract has been published, but we give place to it in the MAGAZINE, because the time will come when, as in the records of cases of indicting, hanging and burning witches, the document will be valuable as a curiosity, particularly the stipulation that the unfortunate seeker after work absolutely abandons his manhood and everything else that distinguishes him from a slave. Here is the document:

## THE PHILADELPHIA AND READING RAILROAD CO.

### APPLICATION FOR EMPLOYMENT.

Name of applicant.

Age.

Address.

Married or single.

Where last employed, how long and in what capacity?

Reason for leaving place of last employment?

Length of time in railroad service, on what road and in what capacity?

Do you use intoxicating liquors?

Full address of reference.

Can you read and write?

Are you a member of a Labor Organization, and if so what one?

If a member, will you withdraw and refuse to support or belong to any Labor Organization if you take service with this Company?

Are you willing to become a member of the P. & R. Relief Association?

[Dated],

189

[Signature].

The foregoing is the contract two unfortunate members of the B. of L. E. had signed, who, when they appealed to P. M. Arthur for such relief as a great and influential brotherhood could extend, were told that they were not entitled to consideration.

What is imperatively demanded is a law that makes all such contracts void, *ab initio*.

The article on "Short Studies in Political Economy" in this issue of the MAGAZINE is by error credited to William P. Borland instead of Wilfred P. Borland.

THE attention of our readers is specially directed to the advertisement of John J. McGrane, the "Brotherhood's Jeweler," which appears elsewhere in the MAGAZINE. Mr. McGrane is a member of Division No. 105 of the Brotherhood of Locomotive Engineers, and by fair and honorable dealing has built up an enterprise that merits the patronage of all classes of railroad men. Mr. McGrane has an extensive stock of first-class goods which he sells at reasonable prices, and those contemplating a purchase in that line will do well to give him a call. Mr. McGrane guarantees satisfaction to every purchaser, and his reputation for integrity is too well established to require endorsement.

WE have received an official portfolio of the World's Columbian Exposition, to be held during the present year, in Chicago. The little book contains illustrations of the fourteen structures, with a bird's eye view of the great Exposition Park. These illustrations are exact reproductions, in water color effects, of the original drawings, made especially for the portfolio, and are genuine works of art. The portfolio, which should be in every home in America, can be had by inclosing ten cents in postage stamps to the Charles A. Vogeler Co., Baltimore, Maryland.

### THE PROMOTION OF FIREMEN AND HIRING OF ENGINEERS.

MR. EDITOR:—I was much interested by your reference, in the November number of the MAGAZINE, to the mission of a committee of engineers sent by the Atlanta convention of the B. of L. E., to confer with the Grand Lodge of the B. of L. F., in regard to the promotion of firemen and the hiring of engineers.

I think this is a matter of the most vital importance to the welfare of both firemen and engineers, much more so than any issue that is up for debate at present, or that has been discussed in a great while. It is a question that will bear examination on its merits, and a free and open discussion is what is necessary when any question of like importance is being considered by a vast body of men, the final outcome of which will affect their earnings one way or the other.

But in coming to a verdict on the matter we should take into consideration the Jeffersonian principle, viz: "the greatest good to the greatest number," and remember that neither individuals nor trade unions can permanently prosper by the misfortunes of others. Nations, unions and individuals are so dependent on each other that a misfortune to one is an injury to all, to a certain extent.

I think it best that the Cincinnati convention did not act favorably on the engineers' proposition, unless they could have been very near unanimous on the question. The matter is now open for discussion; if it is expedient and just to both engineers and firemen, as well as to the railroad companies, it should be adopted at as early a day as practicable; if not, it should go the way of all fallacies.

It is often said that "nothing succeeds like success," but it should be remembered that nothing succeeds permanently but what is right, and that "error is not dangerous so long as truth is left free to combat it."

I will admit, for the sake of argument, that it does look selfish for a craft or profession to attempt to prevent competition by restricting the number of persons engaged in a certain occupation; but it is no more unjust than the creation of a surplus which will tend to one bidding against another, thereby lowering the wages of the entire craft; and when wages are reduced the skill and efficiency of the workers is impaired in proportion; also, consumption is, in a measure, curtailed, thereby checking production.

As I understand the matter the object of the conference between the two orders asked for by the engineers was simply to come to an amicable understanding with the firemen as to what proportion of promotions, as compared with the number of engineers hired, would be necessary to fill the vacant positions. Of course it was understood that the management of the various railroads were a very important factor in the matter; but it would be useless to present the case to them on its merits without the hearty co-operation of the firemen.

A great many of the arguments brought forward by some firemen in favor of filling all vacancies in the position of engineer by promoting a fireman, instead of, at least, filling a large per cent. of vacancies by hiring experienced engineers, are rather superficial, to say the least. Some argue that after a man has fired an engine a certain number of years he should be promoted regardless of how many competent engineers are seeking employment; and that all roads should make their own men. Then again it is said that if an engineer attends strictly to business he will not be discharged and looking for employment. This is a good deal like saying that if all men were good none would be bad. On the other hand, a great many firemen, with most of the engineers, claim that the rapid promotion of firemen is more detrimental to the interests of firemen than engineers, as the former, after they are promoted, if the wages are reduced, will have a longer period to run for small pay, than a great many old engineers who have in the past got good pay and in the natural order

of things won't run much longer; hence any act of the firemen in creating a surplus of engineers, to bid against each other for employment, would be similar in results to a son who was soon to inherit his father's estate, acting in such a way as to deprecate the value of the property at his parent's death.

Previous to 1860 a great many roads created their engineers from machinists, especially in the south; that practice has been discontinued, the whole supply of engineers being now taken from the firemen. If every competent engineer in the country was given a chance at employment there would still remain a good, healthy demand for engineers, because of the increased mileage constantly being built, vacancies caused by deaths, and others going into other kinds of business, promotions in the service, etc.

There is no reliable data at hand to show the percentage of roads which do not hire engineers, but no doubt it is very large; and under the workings of the present system the firemen on those roads that do hire engineers are placed at a disadvantage with the firemen on those roads that do not, for the reason that the discharged engineers from the latter roads go to the former seeking employment, thereby crowding out worthy firemen who have, perhaps, been firing longer than the engineers who supplant them have been firing and running altogether.

We should remember another thing: should firemen demand that no engineers be hired but that they shall be promoted from firemen, the wipers and machinist helpers, should they ever organize to benefit themselves, might demand that firemen be not hired, but promoted from their ranks. The situation would then be that an engineman would either be tied down for life to the road he started on, or after serving his apprenticeship and losing his situation he would be compelled to start life over again, on some other road, at the foot of the ladder.

We will suppose a young man starts in as machinist helper; at the end of five years he is on the right hand side; he runs five years and is discharged; then he has to start at the foot and serve five years again; after spending the best years of his life on the rail he would not be competent to go into any other business and make a success of it in the face of as much competition as there is at present. I claim that the system of rapid promotions works more to the advantage of the large army of the unemployed, men who intend to go firing but have not done so yet, than to those who are engaged in the business at present; there are vacancies continually being made at the top, and being filled at the bottom, in continual rotation; and the older the service of the fireman the more he is interested in the standing and pay of the engineer. In treating a subject of such vast

importance to enginemen, we should look at the matter in all its bearings—I might say, in a statesmanlike manner, and not only look at its effects on one road or system but take into consideration the situation in a general sense, all over North America.

LITTLE ROCK, ARK.

*Robert Heriot.*

### SHE WAS DROWNED.

"A little nonsense now and then,  
Is relished by the wisest men."

MR. EDITOR:—For the purpose of establishing my belief in the above quotation, I will relate an incident which actually occurred, and which will cause the most sedate to smile.

It has been said, many times, that you may burn an engine, but you can't drown her; the following incident will prove this to be untrue; there is one instance, at least, of an engine being drowned and towed in a corpse. The facts are as follows:

A good many years ago the M. & C. ran an accommodation train out to Germantown, 14 miles, every evening and back in the morning. One of the machinists in the shop lived in Germantown, and he got the idea into his head that he would be doing the company a great favor by running this train in addition to his day's work in the shop. He made application for the job and got it, made several successful trips, but finally came to grief. Going out one evening, he got so much water in the boiler that when he opened her up for a little grade the water ran back through the flues and actually put the fire out. She was a wood burner and did not have much fire in the box as it was near the terminus. The first thought that occurred to this juvenile engineer, was that she was burnt, and the idea was so positive to him that he never thought of trying the negative side of the question, but let the engine be towed into Memphis. The next morning a jury of inquest composed of the Master Mechanic, boss boiler maker and all the loafers around the round house, was held upon the corpse. The first witness examined was the flues; their evidence was that nothing of a serious nature had occurred to any portion of the fire-box unless it was the crown sheet. The crown sheet, being the highest authority in the matter, was then put upon the stand, and stated that as nothing serious had happened to it, the trouble was evidently somewhere else. About this time the Master Mechanic (Burke), who is always looking for new theories, bethought him of an overdose of water, and said to one of the loafers in the cab, "try those gauge cocks." This revealed the fact that the boiler was full of water. "Come out of that fire-box, Mack," exclaimed the Master Mechanic, "the cursed fool drowned her instead of burning her."

If any person doubts the above, let them ask Buck Elliott, ex-Superintendent Motive Power of the T. P. R. R., but don't intimate that he was the fireman in the case. He had just finished his time in the shop and like most other young men wanted to go on the road. It is said Buck did not want to go any more for a long time after this trip.

TUSCUMBIA, ALA.

### WILL YOU FEDERATE?

MR. EDITOR:—The writer of these lines lays no claim to the title of sage, or seer, or soothsayer. Yet he is constrained to look toward the future, though he may not be permitted to foresee with absolute certainty the coming of events. It has been his destiny, or the result of his own management, to be placed in the ranks of railway employees. He has met, at various times and places, hundreds of "railroad men" from the various branches of railway service. He has noticed from year to year dissatisfaction, discontent and unrest; and this feeling seems to be growing stronger and more marked. Employees now, more than ever before, hesitate about investing in permanent homes. Permanence in their present positions seems to be almost despaired of. From all sides and from all branches of the service is heard the declaration that men are being discharged from the service for trivial and unimportant offenses. Positions are becoming more and more difficult to obtain, and in some departments of very many roads, impossible to secure by an experienced man. The requirements of the service are becoming more and more exacting. Occurrences that formerly would have been only noticed by a few words of advice or censure are now considered sufficient cause for long suspension or dismissal from service. Employees are being subjected to rigid examinations, both as to mental qualifications and physical fitness. Duties and responsibilities are being constantly increased with compensation continually hewed down to the "danger line." The unemployed are legion.

In all of this what do we see? Nothing but a unity of suffering, a unity of uncertainty, a unity of dissatisfaction, dissent, and almost—shall I say it—a unity of degradation. In the face of all this why should there be any thing but unity of men, unity of purpose and unity of action. All, or nearly all, the branches of the railway service have corresponding organizations of employees. The pertinent question now is: Gentlemen will you federate? Will you arouse to the supreme requirement of the hour and, without selfishness, bigotry, egotism or intolerance, unite for the defense of every right you have by industry, endurance and self-

denial earned a clear and indisputable title to? If the present industrial army of railway employees as now organized and equipped will not form an effectual federation, then the men in every department of the service who are willing—aye! not only willing, but who are ready to *insist* that every other man shall have, and be secure in, the right to live by his own industry, will have to step forward and form a grand homogeneous, compact and complete union. Time, space nor ability will permit me to give further expression in this line of thought, but after reading the article quoted in the November MAGAZINE from the *Chicago Tribune*, I could not repress the exclamation, made not irreverently, but with absolute alarm and dismay, *Good God!*

*A. H. Tucker.*

### LEGISLATIVE BOARDS.

MR. EDITOR:—The question of organized labor entering into legislation is one that presents itself to every thoughtful advocate of their rights. It has been said, time and again, that the laboring men of the country possessed, in their right of suffrage, power enough to establish and maintain a revolution at any general election. The argument is not successfully refuted. The questions naturally arise, why should all the legislators belong to the aristocracy? Why should all the legislation be in the interest of the moneyed power? Have we not often ran against conspiracy laws and a whole lot of rot called treasonable acts, vested rights, etc., in our struggles for an honest day's pay for an honest day's work? Are not the men at Homestead now on trial for killing a lot of corporation thugs? Cannot armed invasion of any state, by a private army, be prohibited by law? Does any sane man believe it will be, if the plutocracy have their way?

The call to arms rang out along the Eastern coast one hundred and sixteen years ago. Eighty years have rolled away since the same call to meet the same enemy, was passed from post to post. Thirty-one years since we went forth to spill one another's blood for politics. And while all the pomp and circumstance of war is abroad in our land, the moneyed men are reaping a rich reward for the intemperance of the masses.

The rebellion was a moneyed man's war, and the rich made money out of it, while the poor made themselves poorer. I would issue a call to arms! But I would issue that call to organized labor, and I would have it arm itself for a peaceful battle of the ballot. I would have a perfected legislative board in each branch of organized labor. I would have these boards interview every candidate for the state legislature and congress and find their views on the subject of labor legislation, keep a record of their ante-election promises, and send a lobbyist

to the session to keep a record of their votes on such questions. Then, issue, for the guidance of our members, a pamphlet showing these records, just previous to each election. Educate our membership to vote as one man, regardless of party affiliations, for our friends, and do everything in their power to keep our enemies at home.

It is a plain fact to any one that little or nothing is to be gained by strikes. The general proposition is advanced that one dollar spent for legislation will accomplish more good than five dollars spent for a strike.

In Minnesota, two years ago, Nos. 61, 82, 258 and 270, sent a man to St. Paul, for less than a dollar per man, and he assisted in getting an anti-Pinkerton law and a ten-hour law on our statutes. The consequence is plain enough.

On August 14, 1892, representatives from eight lodges in Minnesota, met, pursuant to a call issued by a member of No. 82, and formed what they were pleased to term the "Minnesota State Legislative Board of the Brotherhood of Locomotive Firemen"—two other lodges had signified their intention of standing their share of the expense. The board elected a chairman and a secretary; they decided to request the Master of each lodge in the state to appoint a committee to wait on the various legislative candidates in their localities and ascertain their views on labor legislation; to send out a pamphlet showing the record made by members of the last legislature, to all organized labor in the state; to request our members and their friends to vote for our friends; to raise revenue by levying a per capita tax to meet the expense, and also to send a man to St. Paul at the coming session to have introduced and work for the passage of

1st. An Iron Clad Law, similar to H. F., 367, of the session of '91. This bill made it a misdemeanor to request any man to sign, as a condition of employment, any paper renouncing any of his rights as a citizen, or compelling any man, on penalty of dismissal from the service, to withdraw from any labor organization.

2d. A Three Year Bill. This bill, if it became a law, would prevent any man who has not fired a locomotive for at least three years from either being offered or accepting a position as a locomotive engineer. The bill aims to strike a blow at every corporation who are doing their d—dest toward filling the country full of unemployed engineers.

3d. A Bill to prevent the stoppage of any part of a man's pay for life insurance, watch inspection, color blind tests, etc. The press dispatches recently informed us that a late decision in Maryland, ordered the Baltimore & Ohio railway to return to the men all of their stealings for the last nine years, from the employees' pay roll, under the catching title of "insurance."

4th. A law defining the co-employee and the superior officer, and providing that any person who has authority to issue orders to another, is a superior officer and not a co-employee. We have been quite successful in aiding our friends to get re-elected, and our enemies, who have been successful, know that we are alive and ready for another round two years from now if they don't come down off the perch a little. We will issue an assessment of one dollar, and probably have some money to go back after our bills are paid. We will hold our state board together and be ready for business two years from now.

I can cheerfully pronounce our venture a success, so far as we have gone; what the future may bring forth is not for me to say. Brothers of other states, try it. Brothers of Minnesota, stand up and dare to maintain the ground you have gained in this campaign of '92.

*Ernest B. Mayo.*

MINNEAPOLIS, MINN.

### TO COLONEL MAYNARD.

My dear Colonel, how are you? I hope you are well,  
From your head to your heels just as sound as a bell.

Mind, I mean what I say, I'm no hypocrite rogue,  
To go blarneying you up in a blatherskite brogue,  
Like the many who have an abundance of breath,  
Floating round in life's shallows, to talk one to death.

I am one who admires you, and wish in your ear  
All the sweets of the season and happy New Year.

'Tis a good while ago since I read of you first,  
And since then I have quaffed with a ravishing thirst  
Every line which I found had the stamp of the mint  
And the seal of your genius before me in print.  
But the pleasures I felt as your lines I'd peruse  
Either written in prose or the fruits of your muse,  
Were eclipsed by the eloquent sound of your tongue,  
Rolling out notes as clear as a silver toned gong.

I supposed ere we met you were hard to approach,  
That a pigmy you wouldn't permit to encroach  
On the dignity which you might safely assume,  
But your heart, I soon found, for self pride had no room.

From the glance of your eye and the grasp of your hand

Timid feelings took flight, like the wave of the wand  
Which a conjurer wields, when he wishes to please,  
And I felt in your presence perfectly at ease.

There's a temple as broad as earth's widest domain,  
With communicants bound by the creed of the brain;

On its portals all lovers of genius can tread;  
In its niches are garlands for living and dead;  
They're bestowed as a mark of distinction on few—  
Who have talents to win as brilliant as you.  
From its altars you send a delectable feast,  
For you rank in that temple a worthy high priest.

Once again I desire you a happy New Year;  
May it wax and it wane without cause for a tear.  
May its springtime be fruitful of buds, which shall blow

In the bloom of its summer with pleasure aglow;  
May its autumn and winter glide slowly away,  
Like the glimpse which we get of the sun's fading ray.

Ere he sinks in the west mid the beautiful dyes,  
Which are flashed from his face before leaving the skies.

*Shandy Maguire.*

# GRAND LODGE.

## ASSESSMENT NOTICE FOR JANUARY.

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., January 1, 1893.  
ASSESSMENT No. 84, \$2.00.

### To the Receivers of Subordinate Lodges:

**SIRS AND BROTHERS:**—You are hereby notified of the death and disability of the following members entitled to all the benefits of the order, viz:

**CLAIM No. 864.** Archie Buchanan, of Royal Gorge Lodge, No. 59, was killed by Railroad Accident, October 8, 1892.

**CLAIM No. 865.** Geo. E. White, of Prairie Lodge, No. 170, died of Diphtheria, October 22, 1892.

**CLAIM No. 866.** Al. W. C. Hoffman, of Cactus Lodge, No. 94, was killed in a Collision, October 28, 1892.

**CLAIM No. 867.** David Kelly, of Overland Lodge, No. 123, died of Heart Disease, October 28, 1892.

**CLAIM No. 868.** Richard E. Brewer, of Plain City Lodge, No. 288, was killed by Railway Accident, October 28, 1892.

**CLAIM No. 869.** Charles S. Thomas, of May-Flower Lodge, No. 415, died of Typhoid Fever, October 30, 1892.

**CLAIM No. 870.** Michael Flannigan, of D. J. Chase Lodge, No. 269, was declared totally disabled with Spinal Sclerosis, November 1, 1892.

**CLAIM No. 871.** Isaac C. Heustis, of Pacific Lodge, No. 173, was declared totally disabled by Insanity, November 5, 1892.

**CLAIM No. 872.** Thomas Stanton, of Great Western Lodge, No. 24, was killed by Railway Accident, November 6, 1892.

**CLAIM No. 873.** B. H. Carmody, of Anchor Lodge, No. 54, died from injuries received in a Collision, November 7, 1892.

**CLAIM No. 874.** William Witzig, of Chippewa Valley Lodge, No. 496, was killed in a Collision, November 10, 1892.

**CLAIM No. 875.** E. Ware Boyd, of Ramona Lodge, No. 385, died of Consumption, November 14, 1892.

**CLAIM No. 876.** Thomas W. Harkins, of Lone Star Lodge, No. 70, died of Meningitis, November 14, 1892.

**CLAIM No. 877.** Henry Veal, of J. M. Raymond Lodge, No. 49, died of Bright's Disease, November 21, 1892.

**CLAIM No. 878.** Geo. W. McFadden, of Beaver Lodge, No. 117, died of Phthisis Pulmonalis, November 22, 1892.

**CLAIM No. 879.** Wm. W. Costello, of Elkhorn Lodge, No. 28, was killed in a Wreck, November 22, 1892.

**CLAIM No. 880.** Richard J. Holahan, of Harrisburg Lodge, No. 174, died of Brain Fever, November 22, 1892.

**CLAIM No. 881.** Dennis Toner, of Marble City Lodge, No. 853, was declared totally disabled by having Hand Crushed, Nov. 23, 1892.

**CLAIM No. 882.** Patrick Trant, of Fellowship Lodge, No. 121, was declared totally disabled by Fracture of Ribs and Leg, November 24, 1892.

**CLAIM No. 883.** Wm. T. Wilson, of Oriole Lodge, No. 214, was declared totally disabled by Paralysis, November 26, 1892.

**CLAIM No. 884.** A. B. Appold, of Oriole Lodge, No. 214, was declared totally disabled by Spinal Disease, November 26, 1892.

**CLAIM No. 885.** David C. Tucker, of Adopted Daughter Lodge, No. 3, died of Typhoid Fever, November 27, 1892.

**CLAIM No. 886.** James M. Cook, of Neches Lodge, No. 156, was declared totally disabled by Injury to Leg, November 28, 1892.

**CLAIM No. 887.** John F. Gray, of Smoky City Lodge, No. 219, was killed by being Run Over by an Engine, December 4, 1892.

**CLAIM No. 888.** Robert Gardner, of Cherish Lodge, No. 440, was declared totally disabled by Spinal Disease, December 9, 1892.

**CLAIM No. 889.** Thomas Keegan, of Metropolitan Lodge, No. 368, died of Typhoid Fever, December 10, 1892.

**CLAIM No. 890.** Louis K. Shirley, of Clark Lodge, No. 297, was declared totally disabled by Locomotor Ataxia, December 10, 1892.

**CLAIM No. 891.** Walter Renwick, of St. Clair Lodge, No. 116, was declared totally disabled with Hemorrhage of Lungs, December 12, 1892.

**CLAIM No. 892.** Andrew L. Dixon, of John A. Logan Lodge, No. 470, was declared totally disabled by Fracture of Fore Arm, December 13, 1892.

An assessment of TWO DOLLARS (\$2.00) has been levied for the payment of the above claims, and you are required to forward said amount for each member whose name appears on the rolls of membership JANUARY 1ST, 1893, (also for all members having taken a withdrawal (limited or final) after NOVEMBER 1ST, and for all members who died or were totally disabled since that date), said remittance to reach the Grand Lodge not later than JANUARY 20TH, 1893, as provided in Section 50 of the Constitution. Any lodge failing to make returns as above provided will stand suspended from all the benefits of the order, as per Section 52 of the Constitution.

Yours fraternally,

F. P. SARGENT, G. M.

EUGENE V. DEBS, G. S. and T.

## SPECIAL NOTICE.

OFFICE OF THE GRAND LODGE, B. of L. F. }  
TERRE HAUTE, IND., December 20, 1892. }

*To Subordinate Lodges:*

DEAR SIRS AND BROTHERS:—You are advised that at the Third Biennial Convention of the brotherhood, held in the city of Cincinnati, in September, 1892, Brother Frank W. Arnold was elected Grand Secretary and Treasurer, to succeed E. V. Debs, whose term of office would expire January 1, 1893.

This notice is issued to inform the brotherhood that E. V. Debs, present Grand Secretary and Treasurer, will continue in office until January 31, 1893.

The explanation of the continuance in office of the present Grand Secretary and Treasurer is, that the quarters of the fiscal year end October 31, January 31, April 30 and July 31. By the Constitution, the official term of the Grand Secretary and Treasurer expires on January 1, 1893, thirty days before the expiration of the fiscal quarter, which ends January 31, 1893.

The accounts of the brotherhood are kept by quarters, that is to say, at the expiration of each quarter all accounts are closed and balances obtained. To do this, previous to the expiration of the quarter is impracticable, and would lead to endless and needless confusion. Therefore, to obviate such embarrassments, E. V. Debs, the present Grand Secretary and Treasurer, will continue in office to the end of the quarter, January 31, 1893. At that time he will submit his final report of the fiscal affairs of the order.

The report of the Grand Secretary and Treasurer submitted at the Cincinnati convention included all matters to the end of the fiscal year ending July 31, 1892. On January 31, 1893, six months of the current fiscal year will have expired and the report at that time will present the fiscal affairs of the order in proper shape to be turned over to his successor, Brother Frank W. Arnold, who will be inducted into office February 1, 1893, and who is clearly of the opinion that the present Grand Secretary and Treasurer should close up his accounts for the quarter ending January 31, 1893, before they are transferred to his successor.

The laws of the order provide that the Grand Secretary and Treasurer-elect shall take office on the first Monday in January, but it also provides that the officer in charge shall hold over until his successor is qualified. Brother Arnold, the Grand Secretary and Treasurer-elect, will not qualify before the first day of February, 1893.

At that time the Board of Grand Trustees will meet at the Grand Lodge office and go over the accounts for the purpose of checking the present Grand Secretary and Treasurer out, and of checking his successor into office.

The retiring Grand Secretary and Treasurer will then submit a report to each lodge of all transactions of his office from August 1, 1892, to and including January 31, 1893. At the same time the Board of Grand Trustees will submit a report to the lodges showing the result of their work.

At the next biennial convention of the brotherhood, a law will be recommended to have the Grand Secretary and Treasurer-elect inducted into office

February 1, instead of as at present, the first Monday in January, as it would be at a time when the fiscal affairs of the order are in a condition for transfer by the outgoing official to his successor.

All communications will continue to be addressed to E. V. Debs, Grand Secretary and Treasurer, up to and including January 31, 1893, and thereafter to F. W. Arnold, Grand Secretary and Treasurer.

Yours fraternally,

F. P. SARGENT, G. M.

Attest:

EUGENE V. DEBS, G. S. & T.

## QUARTERLY DUES NOTICE.

OFFICE OF THE GRAND LODGE, B. OF L. F. }  
TERRE HAUTE, IND., January 1, 1893. }

*To Members of Subordinate Lodges:*

SIRS AND BROTHERS:—Pursuant to Section 129 of the Constitution, you are hereby notified that the dues for the quarter ending April 30, 1893, (such an amount as may be determined by the several lodges, provided in no case it shall be less than five (\$5.00) dollars,) are now payable, and must be paid to the Collector of your lodge on or before February 1, 1893. This amount will be in full payment of all subordinate dues and beneficiary assessments levied by the Grand Lodge for said quarter, as provided in Section 132 of the Constitution. All beneficiary members now enrolled and all those admitted prior to March 1, 1893, are liable for the full amount of quarterly dues for said quarter. All members initiated during the months of March and April, are exempt from payment of quarterly dues for said quarter, as provided in Section 129 of the Constitution. Any member failing to make payment as above provided will be expelled from the order, as per Section 130 of the Constitution, said expulsion taking effect February 2, 1893, and the Secretary is required to make due report thereof to the Grand Lodge.

Yours fraternally,

F. P. SARGENT, G. M.

EUGENE V. DEBS, G. S. AND T.

## NOTICE TO SECRETARIES.

OFFICE OF THE GRAND LODGE, B. OF L. F. }  
TERRE HAUTE, IND., January 1, 1893. }

*To Secretaries of Subordinate Lodges:*

SIRS AND BROTHERS:—Pursuant to Section 130 of the Constitution, you are required to report to the Grand Lodge as expelled all members who fail to make payment of their quarterly dues for the quarter ending April 30, 1893. The names of said members must be reported to you by the Collector of your lodge not later than February 2d, and by you reported to the Grand Lodge, in the prescribed form, immediately thereafter. Failing to report the names of expelled members as herein provided, the Grand Lodge will hold subordinate lodges liable for their assessments, as per Section 53 of the Constitution.

Yours fraternally,

F. P. SARGENT, G. M.

EUGENE V. DEBS, G. S. AND T.

## BENEFICIARY STATEMENT.

OFFICE OF GRAND SECRETARY AND TREASURER,  
TERRE HAUTE, IND., December 1, 1892.

## THE ROBINSON MONUMENT FUND.

The following subscriptions to the Robinson Monument Fund have been received since our last report:

Forest City Lodge, No. 10, B. of L. F., Cleveland, Ohio	\$10 00
Cotton Belt Lodge, No. 204, B. of L. F., Jonesboro, Ark	15 00
J. G. Ray, operator E. & R. Ry, Heltonville, Indiana	25
C. H. Harpst, operator, Wagon Wheel Gap, Colorado	25
Wm. H. Butz, Div. 131, O. R. T., Allerton, Pa	25
C. E. Ragland, agent and operator, Mulkeytown, Ills	25
J. A. Dean, operator A., T. & S. F. Ry., Cedar Point, Kansas	50
E. E. Rogers, agent and operator, Middletown, Va.	25
C. H. Frapp, agent and operator, Lilly, Mich	25
J. O. Stewart, Leeds, Ills	25
W. M. Phipps, O. R. T., Uniondale, Ind	25
E. B. Butterbaugh, Merrillan, Wis	25
M. A. Kraemer, O. R. T., Lononia, Wis	50
L. N. Swift, Div. 138, O. R. T., Osborne, Idaho	25
L. M. Tudar, Div. 26, O. R. T., Manhattan, Kan	25
Previously reported	835 57

Total . . . . . \$864 32

Remittances should be directed to the LOCOMOTIVE FIREMEN'S MAGAZINE, Terre Haute, Ind.

## HOMESTEAD CONTRIBUTIONS.

The following contributions to the fund of the Homestead strikers have been received by the Grand Secretary and Treasurer and by him forwarded to Wm. Weihe, of the Amalgamated Association of Iron and Steel Workers, Pittsburg, Pa:

North Pole Lodge No. 152, B. of L. F., West Bay City, Mich . . . . \$25 00  
J. H. Terrell, of Great Western Lodge, No. 24, B. of L. F., Parsons, Kas . . . 8 10  
McB. B. Glenn, of Vigo Lodge, No. 16, Terre Haute, Ind . . . . . 1 00

Total . . . . . \$34 10

## ACKNOWLEDGMENTS.

COEYMAN'S JUNCTION, N. Y., Dec. 11, 1892.

*To the Brotherhood of Locomotive Firemen:*

GENTLEMEN:—I wish to return my thanks for the payment of \$1,500, on December 5th, the insurance due me upon the policy of my late husband, Bronson Van Slyke.

Yours truly,  
MRS. NORA G. VAN SLYKE.

SACRAMENTO, CAL., December 15, 1892.

*To the Members of California Lodge, No. 260, B. of L. F.:*

GENTLEMEN:—Please accept my sincere thanks for the prompt payment of \$1,500.00, the full amount due on the policy held by my late son, Albert G. White.

Yours respectfully,  
MRS. R. A. WHITE.

PITTSBURG, PA., December 10, 1892.

*To the Brotherhood of Locomotive Firemen:*

GENTLEMEN:—I desire to express my sincere thanks to the members of Iron City Lodge, No. 318, for their many acts of kindness and sympathy shown me during my recent illness, and also for their prompt payment of fifteen hundred dollars, which I received through Mr. Joe King. That the brotherhood may always prosper is the sincere wish of

FRANK M. MILLER.

JACKSON, MICH., December 8, 1892.

*To Edward Bisbee, Triumphant Lodge, No. 47, B. of L. F.:*

DEAR SIR AND BROTHER:—We wish to thank you through the columns of the MAGAZINE for a "model" sent us. The model is very fine and highly appreciated by all the members. We wish Bro. Bisbee and the brotherhood much success.

Fraternally yours,

JOHN P. OGGELL,  
Secretary Gilbert Lodge, No. 240.

DOONCASTLE, IRELAND, November 14, 1892.

*M. E. Neely, Esq.:*

DEAR SIR:—I return you with heartfelt thanks the receipt for the money which I received through you, coming to me on my poor boy's sad death. I thank you very much for your goodness in sending this money without putting me to any trouble, and I shall not forget you in my poor prayers. Wishing you every blessing and comfort, I remain, dear sir,

Yours respectfully,

MARGARETTE DOLAN.

NEW ALBANY, IND., November 24, 1892.

*To the Brotherhood of Locomotive Firemen:*

GENTLEMEN:—I desire to acknowledge the receipt of a draft for fifteen hundred (\$1,500.00) dollars through our Receiver, Bro. G. L. Barbee. I sincerely thank the brothers of Clifton Heights Lodge, No. 268, for their assistance in my misfortune. I also thank Bro. Debs for the prompt payment of my claim. May the B. of L. F. ever prosper, is my prayer.

Yours most respectfully,  
IRA D. STEVENS.

BOONE, IOWA, December 12, 1892.

*To the Brotherhood of Locomotive Firemen:*

GENTLEMEN:—I wish to acknowledge the draft for fifteen hundred (\$1,500) dollars from your noble order as the amount due me on the policy held by my beloved son, Melvin E. Foster. We also feel very grateful to the members of Connecting Link Lodge, No. 26, for the many acts of kindness shown during his sickness and death. May prosperity and success ever be with the order of B. of L. F., is the sincere wish of

[MRS. W. H. FOSTER.

MUSKOGON, MICH., December 15, 1892.

*To the Brotherhood of Locomotive Firemen:*

DEAR SIRS AND BROTHERS:—I take pleasure in acknowledging the receipt of fifteen hundred (\$1,500) dollars, the full amount of my beneficiary certificate; also to express my gratitude to the brotherhood, particularly the members of Muskegon Valley Lodge, No. 481. With earnest wishes for your future prosperity, I am

Yours fraternally,

THOS. A. NEVILLS.

LINCOLN, NEB., November 15, 1892.

*To the Brotherhood of Locomotive Firemen:*

GENTLEMEN:—I wish to acknowledge through our valuable MAGAZINE the receipt of draft for \$1,500.00, the amount due on my disability claim. The draft was presented to me by Bro. J. K. Robinson, Receiver of Bee Hive Lodge, No. 179. Permit me to tender to the brotherhood my sincere thanks and gratitude, and more particularly to the officers and members of Lodge 179, for their kindness and attention. That our Heavenly Father may watch over our brotherhood and deliver its members from affliction is the sincere wish of your ever grateful brother,

E. L. PONE.

FOX DU LAC, WIS., December 22, 1892.

*To the Brotherhood of Locomotive Firemen:*

GENTLEMEN:—In my grief, in common with that of father, brothers and sisters, I offer our heartfelt gratitude to the members of Phil Sheridan Lodge, No. 888, for their kindness at the loss of our beloved son and brother, Patrick Zehren. I also tender my thanks for the draft of fifteen hundred dollars as the insurance on my late brother. Hoping your noble order will ever prosper and remain of aid and assistance to the widows and orphans, I am

Very truly yours,

MARY ZEHREN.

ST. JOSEPH, ILL., December 18, 1892.

*To the Brotherhood of Locomotive Firemen:*

GENTLEMEN:—We wish to thank you for your prompt payment of fifteen hundred dollars insurance taken out by Sylvanus Gibson, our dear son and brother, whom our Heavenly Father saw fit to take from us on the 23d of September. May God's blessings rest with each member of your noble order. May your efforts for doing good be crowned with such success that many will look up and call the order blessed. We also wish to express our thanks to the members of Central Lodge, No. 22, for their kindness and attention to our loved one and us during his sickness and death. Their kindness we shall never forget and we will always have high esteem for the grand order and all its members.

Respectfully,

MRS. MARY GIBSON AND FAMILY.

PINE BLUFF, ARK, November 21, 1892.

*To the Brotherhood of Locomotive Firemen:*

GENTLEMEN:—I am in receipt of draft for (\$1,500) fifteen hundred dollars, which was handed me by Bro. W. H. Rice, Receiver, who is a worthy member and a hard worker for the order. Please accept my sincere thanks. I am sincerely thankful to the members of Etna Lodge, No. 163, of which I am a member, for the brotherly love and affection shown me since my disability first occurred. I also desire to thank the engineers, firemen and conductors of the following named roads (except the old engineer who runs between Bowling Green and Paris (L. & N.) who does not recognize brotherhood men of any class): Wabash, L. D. & W., C. & H. D., Little Miami, N. Y. C. & St. L., W. N. Y. & P. L. & N., for the many kindnesses and courtesies shown me while going over those lines in search of a physician that could give me some hope or relief. Hoping that the order may prosper in the future, as it has in the past, and that its field of usefulness may ever increase, I remain, as ever,

Yours fraternally,

DEWITT HOPE.

COLUMBUS, OHIO, December 1, 1892.

To the Members of *Franklin Lodge, No. 9, B. of L. F.*:

**GENTLEMEN AND BROTHERS:**—Please allow myself and brothers to extend our most sincere thanks for the many kind acts you showed us during the sad death of our dear father, Peter Schneider. Tongue cannot tell how we appreciate your kindness. Also accepted thanks for the beautiful floral offering presented. And may the blessings of God always rest upon you and our noble order.

We remain sincerely and fraternally,

HENRY C. SCHNEIDER.  
SILAS F. SCHNEIDER.  
GEORGE SCHNEIDER.

#### ADDRESSES WANTED.

**HARRY E. STITELER**—Formerly a member of *Flowers Land Lodge, No. 846, Pensacola, Fla.* Any one knowing his whereabouts will please correspond with the Secretary of said lodge.

**PETER RUDISILLE**—Formerly a member of *Trinity Lodge, No. 88, Fort Worth, Tex.* He is an engineer and left for Mexico about two years ago in search of employment, since which nothing has been heard from him. Anyone knowing anything concerning him will confer a great favor by communicating with his wife, Mrs. Jennie Rudisille, 400 Railroad avenue, Fort Worth, Texas.

**M. F. J. BROEFFLE**—A member of *Adair Lodge, No. 100*, who was allowed his disability claim, \$1,500.00, some months ago, disappeared shortly afterward and has not been heard from since. Anyone knowing of his whereabouts will please correspond with the Secretary of said lodge.

**GEO. A. MOSS**—When last heard from was running on the *M., K. & T. Ry.* out of Denison, Tex. Anyone knowing his address will confer a great favor by advising his mother, Mrs. Mary E. Moss, Brookfield, Mo., or his brother, L. Moss, Caldwell, Kas.

#### BOUND VOLUMES OF THE MAGAZINE.

We have on hand a supply of bound volumes of the *MAGAZINE* for the year 1891.

The volumes are artistically bound in a way to withstand wear, and we need not say are intrinsically valuable, containing as they do, a wide range of topics upon subjects well calculated to interest the general reader, as well as those who are the students of labor problems.

In this connection we suggest that these bound volumes of the *MAGAZINE* would be a valuable present on birth day occasions, or as tokens of remembrance, to be presented at any time, and as the price has been reduced to \$1.25 we shall hope to receive sufficient orders to reduce the supply, since no fireman's library would be complete without one.

By addressing *LOCOMOTIVE FIREMEN'S MAGAZINE, Terre Haute, Indiana*, orders will be promptly filled. Cash must accompany each order.

#### JUST WHAT IS WANTED.

Business is alive to a great coming event, and preparations of all sorts for the *Columbian Exposition* in 1893 are active and earnest. Just what is wanted of a unique kind has happily already made its appearance, and we have before us "*THE OFFICIAL PORTFOLIO OF THE WORLD'S COLUMBIAN EXPOSITION*," illustrated from water color drawings. This Portfolio is a rare and beautiful exponent of the main architectural features of the great Exposition at Chicago in 1893. The fourteen magnificent structures are faithfully exhibited, while the bird's-eye view gives a realistic glance at the lay of the grounds, with their principal buildings, lagoons, etc. The illustrations are exact reproductions, in water color effects, of the original drawings, made especially for this purpose from the official plans, by America's best known water color artist, Charles Graham. A copy of this exceptionally fine production will be sent to any address upon receipt of 10 cents in postage stamps, by the *Charles A. Vogeler Co., Baltimore, Md.*

*W. Baker & Co.'s Breakfast Cocoa* is a very comforting drink as the weather grows colder. One of its special merits, giving it a great advantage over tea and coffee, is its heat-giving quality; it fortifies delicate constitutions against the cold, supplying an easily appropriated fuel for those internal fires upon the adequate support of which health and happiness depend. *W. Baker & Co.'s Breakfast Cocoa* may therefore be especially commended as a morning drink, and many people who are liable to sleeplessness have found that a cup of it taken hot on going to bed brings a sound and refreshing sleep. It is absolutely pure, and it is soluble. Unlike the Dutch process, no alkalies or other chemicals are used in its manufacture.

This is an age of co-operation—an era in which large numbers of people are joining together for the purpose of bettering their moral, social and financial condition. We take great pleasure in calling the attention of the brotherhood to a highly deserving institution working along this line. We refer to the *Railway Building and Loan Association* of Minneapolis, Minn., an organization which was effected in 1888 by a number of railroad men, among them John G. Taylor, General Passenger and Ticket Agent of the "Soo" railroad, and J. C. Howard, Assistant Superintendent of the C., B. & Q. Railroad. The company has grown rapidly and solidly, and numbers among its members a great many railroad men. It has invested mortgage assets aggregating \$350,000. Its plans are most liberal and equitable. The Association does business throughout almost the entire country and persons may join at any time. The plan requires the payment from each member of a small sum each month, and these sums are loaned out to other members to aid them in building homes or for other purposes, security for the money being taken by a mortgage upon the home. Many cities of this country, notably Philadelphia and Cincinnati, have been built up in this way. "The Railway" combines the very best features of the very best building and loan associations, whether local or general. It allows demand withdrawals, and if members prefer guarantees the rates of dividend. It is a commendable thing for a man working upon a salary to lay aside a portion of his earnings as an investment; such savings will soon grow into large amounts. This plan of systematic saving is in itself an education. The money thus saved and invested will serve many a useful purpose. More railroad men should own their homes. Under this plan they can own their homes by making such payments as they have heretofore been paying as rent.

#### MAN AND THE LOCOMOTIVE.

A locomotive is noisy when she is hot; so is a man.

When a locomotive gets too full she lays down; men do.

A very old locomotive is apt to be lame; man is the same.

A locomotive's draft is governed by a petticoat; the drafts of men are often affected by the same influence.

On a damp, dark night a locomotive is slippery and treacherous; man too.

A locomotive, when run by night, should always have a pilot; a man should have two.

The best locomotives have to be "jacked up" occasionally; and men.

A locomotive that is always out nights soon becomes faded; we have seen faded men.

A dead locomotive has no pull; dead man same. Locomotives spark nights; so men do.

As a locomotive changes from warm to hot she perspires; and a man.

A locomotive is always hot when there is an "In-jin-near"; heap so white man.

Water is good for a locomotive; try it on a man.

A smoking locomotive is a nuisance; man.

### WOMAN AND THE STEAM ENGINE.

It takes sand to run an engine: so it does to run a woman.

There is usually a great bustle about an engine; so there is about a woman.

It makes a fellow mad to get left by an engine; so it does by a woman.

An engine is an object of much wonder and admiration to men and of fear to horses; so is a woman.

When an engine goes off the track it usually takes a man or more along with it; so does a woman.

An engine is known by its company; so is a woman.

An engine will sometimes blow a fellow up if he puts on too much pressure; so will some women.—*New York Herald.*

### MAN'S DUTY TO MAN.

The father may think to hide certain parts of his character from his child, not wishing him to imitate them, and may give him precepts that he has never followed, but the child absorbs what he fancies is concealed and forgets the words which contradict it. Commands and exhortations may produce or restrain certain acts, but they are powerless to inspire emotions or create desires. Often they have a reverse effect.

To give every one his due, to refrain from taking unfair advantage or in any way enriching one's self at the expense of another, are supposed to be duties which are simply inculcated and obeyed, yet how is the desire of gain, so intense in many minds, to be made to yield when it conflicts with these duties? Chiefly by crediting within the breast a stronger desire for justice and integrity. The love of rectitude, the faith in honor, the desire to deal fairly and squarely with all men, must be aroused and strengthened before anyone can be thoroughly just. And the same is true with regard to every good quality.

### THE YEARS.

They come, they pass, with snow-soft feet,  
And deathless youth illumines their eyes;  
Alike to them are chaff and wheat,  
Alike the foolish and the wise.  
They bring the wound, they bring the balm—  
They light our smiles, they dry our tears—  
Careless of death or life, the calm  
Servants of Time the patient years.

The winds that rend and strew the rose  
Dissolve the sweetness through the air;  
This wind of Time that beats and blows  
Leaves all the past still fragrant fair.  
Though hopes may fail and hearts may break,  
And fruitless all the striving be,  
One golden gift is left to make  
Man's bliss—consoling memory.

Hail and farewell, farewell and hail,  
The going and the coming guest!  
Welcome to daybreak's shining sail,  
As to the night beyond the west!  
The years may come, the years may go,  
And bring the sad or merry mood;  
Merry or sad, one thing we know:  
That life is good—ah, life is good!

—*New York Sun.*

## Packer's Cutaneous Charm

A Balm to the Skin.

**Obstinate  
Skin**

**Diseases,**

**Itching,**

**Frost-Bites,**

**Bruises,**

**Burns, and**

**Cracked, Rough Hands**

speedily yield to the almost magical influence of this excellent remedy.

**Packer's Cutaneous Charm** is sold by Druggists at 25 and 50 cents per bottle. Special style in turned wood, screw-cap box for mailing, 35 cents post-paid (stamps or postal note).

**Packer Mfg. Co., 100 Fulton St., N.Y.**

**A Scalded Engineer,**

**A Bruised Fireman,**

**A Sore-Handed Conductor,**

**A Chap-Handed Brakeman,**

**A Bleeding Switchman,**

Will find a comforter and healer in a cleansing and refreshing wash with

**Glenn's - - -**

**Sulphur Soap.**

It is not a fancy toilet soap, but a plain, every day remedy for the mechanic, the busy housewife, and the children. No household should be without it. Ask your druggist for it; he keeps it.

## EDITORIAL.

---

JAY GOULD.

---

At 9:15 A. M., Tuesday, December 2, A. D., 1892, Jay Gould died at his home in the city of New York, in the 57th year of his age, surrounded by his family. According to well authenticated statements his death was as tranquil as when an infant goes to sleep upon its mother's breast. For some time previous to his death he had been unconscious; suddenly his mind regained its throne, when he recognized each one of his family, called them around his couch, whispered to them his farewells, then relapsing into a comatose condition passed away. In all of this there is nothing spectacular. Jay Gould died unobtrusively. The richest man in the world, he died like a man whose income is a dollar a day. Jay Gould abhorred pageantry. He never made a display of the pelts of the bulls and bears he had slaughtered. He hung no scalps upon his belt, nor decorated his wigwam with such trophies of his prowess. He was preëminently a modest man. He had no "dying words" for the public ear. His tastes were all simple. He was neither gourmand nor bacchanal. He did not drink stimulants, smoke cigars nor chew tobacco. He was absolutely free from bad habits, and in such regards, at least, he stood a towering example to all young men, even theological students. In

stature and weight he was below the average. His head, "the dome of thought and palace of the brain," was superb. His eye, black and piercing, was a distinguishing feature, and once seen was never forgotten. His courage, daring, will-power, audacity, self-control, were known and read of all men. In tactics and strategy on fields where his battles were fought, he had no peer. He was in almost everything *sui generis*, to the world around him a sphinx, a riddle no one could solve. He was his own preceptor. He was a student of men—a mind reader. He discerned at once if the man he wanted as a tool was for sale, sized him up intuitively and knew what he was worth, paid cash, and placed his collar on him. His estimate of judges, juries and legislators was equally infallible. Of the laws that concerned him he was familiar with every technicality and saw at a glance the holes through which he could take a railroad train with entire safety.

The remarkable times in which Jay Gould lived and wrought, produced no more remarkable man than Jay Gould. During a quarter of a century there was not a man on any continent, from prince to peasant, who occupied so large a space in the public mind as Jay Gould. Not even the Rothschilds, one or all of them together, were as conspicuous in the financial world, in the sense of being talked about. If he talked, the wires flashed his words over the land and under the sea. If he was silent, the fact was, if possible, of still greater consequence. Hence the sobriquet, "Wizard," and it is not to be questioned that there were those who believed him to be master of the black art, because his methods were different from those of other men. As a consequence he became an object of alarm to thousands of Wall street speculators and gamblers, who breathed easy only when assured that Jay Gould was not in the market.

It is widely asserted that Jay Gould was a railroad wrecker, but those who make the charge are careful not to name the roads he wrecked. They doubtless refer to the Erie, but upon examination it is found that in his Erie deal he was fighting old Commodore Vanderbilt, and out-generaled him, that is all. True, old man Drew got squeezed in that remarkable deal, but it was because at a critical time he deserted Gould and played into the hands of Vanderbilt, and when he found himself in a hole he pleaded with Gould to rescue him, but owing to Drew's treason he was left to pay the penalty of his treachery. In this there was nothing peculiar. Men do the same

thing three hundred days of every year, but Gould had the fortune always of being selected for maledictions.

The times in which Jay Gould's lot was cast were corrupt. Wall street was and is a den of robbers—a place which, when men enter it, they leave conscience behind. It is an arena where bulls and bears engage for the mastery. It is war to the hilt. There is neither compassion nor quarter. Ordinarily the longest purse, the largest bank account wins, but not always. Strategy, tactics, prescience, accurate knowledge of conditions and dash have won many a Wall street victory. It is said that Jay Gould engineered matters to bring about "Black Friday." Admit it—how was it done? and why was it done? A number of speculators were trying to down Jay Gould and his confreres. It was a battle on a gigantic scale in speculation possibly without parallel. Gold was locked up amounting to many millions; as a result prices of stocks went down; men were wrecked. At a certain time the locked up money was released, then prices went up. Those who understood the scheme made money, those who did not, lost. Jay Gould, being the superior general, won. It is the same old story, repeated every day, not upon so large a scale, perhaps, but with the same purpose in view. Why then this ceaseless denunciation of Jay Gould? Why not arraign the entire brood of men who make money by similar processes? Indeed, if it is gambler rob gambler, who cares which one wins? But it is said that Jay Gould robbed women and orphans. Here again no specifications are made. It is one of those sweeping charges which no one seeks to prove because there is no specific proof. Nor does the public desire proof. It prefers to curse Jay Gould without proof. The captivating form of the charge is that Jay Gould was never more delighted than when "shearing lambs"—that being cold, cruel and heartless, he delighted in seeing innocence suffer. Such a charge, we apprehend, is totally fallacious. It is true that Jay Gould was a speculator—to use a current and eminently just phrase, he was a gambler in stocks. He put up his money and took his chances. Let it be understood that this form of gambling has the sanction of law, that those who engage in it are often men of culture, pillars in society and in the church. Jay Gould was neither better nor worse than the rank and file of such gamblers, the only difference being that in tact, vigilance, the knowledge of men and

conditions, he was superior to all the Wall street gamblers of his time. He was not always successful, but he had the rare ability to learn important lessons from experience, a quality that all men do not possess.

It is well known that there are multiplied thousands of persons in the United States who having accumulated a little money conclude to go into Wall street and gamble in stocks. These are the "lambs" we hear so much talk about. Of those who win, nothing is heard, but those who lose bleat so loudly that all creation hears, and quick as a flash all creation credits their misfortunes to Jay Gould, when it is doubtless true that in all his life he never knew one of these innocent creatures who tried to better their condition by taking a fly in stocks in Wall street. Jay Gould's enterprises were on a magnificent scale. When a bull he tackled bears, and when a bear he skinned bulls—but he was never found shearing small fry. He did not fish for minnows, he did not hunt squirrels. His hooks were baited for whale and his gun loaded for b'ar. If Jay Gould wanted to buy certain stocks he sought by such means as he could command to reduce the price; if he wanted to sell his tactics were changed and he sought to advance prices. That he accomplished his purposes more frequently than other men, accounts for many millions of his vast fortune, but not for all of his accumulations.

Jay Gould is credited with watering stocks. The charge is doubtless true, and at the time of his death a large per cent. of his fortune was doubtless pure water. Of all the schemes ever devised for swindling the public, stock watering is probably the most nefarious—but mind you, it is according to law, or there is no law against such public robbery. In this, as in other schemes for money making, Jay Gould was like the rest of the pirates who engage in that sort of business. And it so happens that there is not sufficient public virtue to arrest and crush the outrage. It should be understood that in all cases where crime flourishes under the protection of law, or because there is an absence of law, the public is a partner in the crime, and as investigation would demonstrate, is responsible for much of the present debauchery. The point we make, therefore, is that it is unjust to single out one man for the purpose of denouncing him, when he is only one of many engaged in these disreputable practices, and when it is considered that the laws of the country

are silent in such matters, the anathemas of press and pulpit directed against millionaire gamblers might prudently give place to ceaseless bombardment of law makers, who for considerations permit wrongs to multiply and go unpunished. In a word, while the state, speaking through its legislature, and the nation, speaking through its congress, permit nefarious practices to go unpunished, the verdict must be that the state and nation are in league with brazen rascality and equally responsible for existing debauchery.

It is charged, and is doubtless true, that Jay Gould would not hesitate to buy anything on the market that could be turned to account in carrying out his schemes, and that he found judges and legislators for sale, ready to barter opinions and votes for boodle, is not to be denied. But Jay Gould was not alone in this business—only one of many who practiced the demoralizing policy. The public clothed moral deformities with power, and Gould purchased them as he would any other commodity; and yet, the public vented its denunciations upon Gould, and continued to place such traitors to truth and justice in places of trust and responsibility—another case in which Gould's morality and business methods were in accord with the standards which the public erected for the measurement of men—hence the appropriateness of Wm. H. Vanderbilt's expression, "The public be d—d!" He had a sovereign contempt for the public, because the public, whatever its convictions, lacked the courage required to enact laws with adequate penalties to suppress the machinations of millionaires, when they put in operation machinery to rob their victims, and as Jay Gould was a prince among these fortune makers, it has been popular to visit upon his devoted head a double *portion* of cheap curses.

But men in the employment of the railroads of the country will ask, after all, what has been Jay Gould's treatment of men employed on his railroads? How has he treated workingmen in his employment when he has been in a position to make his word the law? It is said that at his death he owned or controlled 10,000 miles of railroads and had in his employment 100,000 men. What are these men saying now, that Jay Gould is dead? How does Jay Gould compare with McLeod, Corbin, the Vanderbilts, Depew and other railroad magnates? Has Jay Gould issued orders that his employes shall not belong to labor organizations? Has he employed Pinkerton thugs

to murder workingmen? Has he ordered men to shave off their whiskers and button up their coats? Has he sought to inaugurate a policy of robbery and degradation? Try Jay Gould by these standards, and no railroad king in the land expands to grander proportions. Already, lodges of workingmen on lines of railroad controlled by Jay Gould are bearing public testimony of his generous treatment,—and one word from such men is more than a thousand columns of newspaper detraction or the vapid utterances of pulpits—and the fact that he placed his interests in a man like S. H. H. Clark is proof conclusive that he was animated by a sincere desire to promote fair dealing with employes on all of his great lines of railroad.

Those who denounce Jay Gould bear testimony that he loved his home, his wife and children; that he was in all things a model husband and father; that he was absolutely uncontaminated in habits, and never used his wealth to promote social debaucheries. He did not belong to New York's aristocracy. He was not one of the "400." In this Jay Gould was better, immeasurably better, than the times in which he lived.

He loved money for the power it conferred to make money. He is said to have been charitable, but made no display of his gifts. His life was one continuous battle with speculators—bulls and bears—gamblers. In dealing with them he proved himself to be the superior of them all. They would have sacrificed him had they been able to have accomplished his ruin. They were heartless, but not conquerors. Jay Gould's dispatch to those who were in his confidence, after a battle, was like Cæsar's, "Veni, vidi, vici," or like Perry's, "We have met the enemy and they are ours."

---

## WHY GREAT CITIES?

---

The first city we read about was built by Cain, the first murderer, who went forth with a murderer's mark upon him. This murderer's first born was a son, and Cain being a doting father named the city he built Enoch, in honor of his son, who bore that name. Such was the beginning of cities, as recorded in the scriptures.

All cities, from the first accounts we have of them, were dens of

iniquity, and it is not surprising, therefore, that the declaration was long since made that "God made the country, and man the city." Men are gregarious animals; they delight in herding together, and the more vicious they are the more compact do they seek to have their abodes. It seems to have been characteristic of human animals from the beginning, and it further appears that all of the great cities of remote ages were centers of wickedness—conspicuously, Sodom, Gomorrah, Zeboim and Admah—in all of which infamous practices had become so common, such as pride, gluttony, idleness, haughty neglect of the poor, together with unnatural vices, that God's patience became exhausted and He rained upon them a storm of fire and brimstone and sunk them to their native hell, and then the Jordan flowed into the cavity and formed the Dead Sea. Great cities have been doomed, for their wickedness, to destruction, as, for instance, Nineveh and Babylon. Along all the track of the centuries, from the city of Enoch to Rome, numberless cities lie buried, and if legendary lore is not totally worthless, their records were about as bad as that of Sodom. Nor is it to be questioned, that the great cities of the earth, as they now exist, are the abodes of depravities, crimes and villainies entirely in keeping with the ancient dens we have named.

Why great cities?—is a question much easier asked than answered. The influence of great cities is known to be in all regards pernicious, and their demoralizing contagion extends far beyond their boundaries. This is known to be true, and yet there is a steady flow of population from the rural districts to the village, town and city. The innocent and pure are ceaselessly abandoning happy and peaceful homes, where all things contribute to physical and moral healthfulness, to take their chances where the earth, air and water are contaminated, and where vast numbers of them are doomed to lives worse than death, more unfortunate than dumb, driven cattle imported for the slaughter-house. Their fate is known, or if unknown the gloom that uncertainty creates is, if possible, more depressing than if the worst had been told.

Men and women are writing of conditions in great cities, but only of virtuous squalor; what lies beyond in the unexplored haunts of vice and degradation is horrid conjecture; the abodes of abominations which defy exaggeration, so foul and beastly as to create inexpressible abhorrence, and which, were they explored, the hideous

pictures, if printed, would be suppressed by the authorities. In view of such facts, the question may well be asked—Why great cities? We have remarked that the question is more easily asked than answered. Nevertheless it is possible to supply certain reasons for the creation of great cities. The great majority of the inhabitants of the civilized world are workers who eat bread in the sweat of their faces, and cities afford diversified employments, because they are the converging centers of capital, and therefore are the centers of great industrial enterprises. The chief industry of the country, that is, the rural districts, is agriculture, or, farming, and here, as elsewhere, the machine is employed and the man displaced. The gang plow, the steam plow, the drills, mowers, harvesters and threshers displace men and set them adrift to search for employment, and they direct their steps to the cities, where their necessities compel them to “sell” their labor for what they can get. Advantage is taken of their necessities, wages go down to a starvation point, and the world stands horrified in the presence of what it calls the “sweating system,” and the tenement house. The abodes of poverty, filth, wretchedness, sickness and death, come into view, and savages, could they behold them, would stand aghast in the presence of the multiplied horrors which they reveal. Notwithstanding all that is told of such horrors—and the half was never told—the stream of humanity from rural abodes steadily proceeds. Capital with devil-fish tentacles grasps its victims and drags them down to death. The cry is, “The labor market is overstocked,” and with this cry, more terrible than a midnight fire alarm, wages go down and thousands find themselves without employment, idle, starving and desperate. What wonder that great cities become great ulcers, forever spewing purulent matter, a poison more deadly than contaminated water, and for which no antidote was ever discovered?

In the great cities of the United States, of which there is so much and such continuous boasting, there is enough of this poison generated every day of the year, Sundays not excepted, to arouse the vengeance of an infinite God, as did the “cities of the plain.” We have civilization and science; literature and religion; the church, the school and the library; we have courts forever grinding, like the mills of the gods; we have legislatures piling up laws like Alpine peaks, and prisons and the scaffold; the experience of the centuries

since Cain built the first city and since the deluge made a clean sweep of all men save Noah and his family—and yet, great cities eternally perpetuate the virus of Sodom, and victims from the country—where all things conspire, sunshine and shower, field and forest, mountain and plain, flowery meads and babbling brooks, to make men happy—ceaselessly throng the gates of cities to eke out wretched lives, die wretched deaths, to find a resting place at last in some potter's field.

Again, why great cities? Who knows why? Of late it is assumed that the people of the rural districts are discontented because they lack companionship, and hence the demand for better roads, to overcome isolation, and it is held that bad roads is one reason why people huddle together like sheep in cities. It is further held that people must have amusements, and since there is little in the country to entertain, to divert the mind, to cheer and enliven, by virtue of which weary hours can be beguiled, men and women flock to centers of population to find fun and relaxation, games and pastimes. The apple-bees, quiltings, spelling and singing schools—all rustic enjoyments—have become effete, and the country folk sigh for the dime museum, the merry-go-round, the blood-and-thunder performances of the modern play-house. This is doubtless in a large measure true, and to the extent that it is true tells in mournful numbers of the pestilential influence of great cities, spreading out like the malaria of swamps, producing everywhere heart, soul and mind failure, corrupting life at its fountain head until in certain sections farms by the hundred are abandoned, to be reclaimed by the wilderness and to be repopulated by beasts and reptiles. And thus we find that while great cities are fruitful of demoralization, vice, crime, squalor, wretchedness unspeakable, there is unrest in the country and a longing desire to go to the cities and take the chances, forgetful of the fact that while there are in cities good people and opportunities to work and advance, the devil's agents are more numerous than policemen and that the saloons have a patronage greater than all the churches; that for every preacher of righteousness there are a dozen or more missionaries of hell, and that the predominating influence is evil, and that continually.

In all great cities there is a ceaseless scramble for the "almighty dollar," in which the "pillars of the church" are often the most conspicuous contestants, and this struggle for cash descends to nickels,

in which there is a pell-mell contest and muss, which, being interpreted, is "every one for himself," leaving the hindmost to the mercies of the devil—a tournament forever going forward, in which "the tall, the wise, the reverend clergy," the millionaire and the tatterdemalion engage, and in which the "survival of the fittest" is not considered. In these carnivals of men reduced to mere animals, multiplied thousands are crushed to death or suffer that sort of "disability" which reduces them to the ranks of vagabonds.

Who does not know that such is life in the great cities now, as it has ever been since the dawn of authentic history?

But there is fascination in it as there is in all games of chance, and as a result, villages swell to towns and towns to cities, until the world beholds a London, a Paris, a New York and a Chicago, and contemplates with pride, or protest, the ceaseless inflow of virtue to be contaminated and transformed into vice. After all, the question arises—Why great cities?

---

## GOVERNORS' MESSAGES ON LABOR TROUBLES.

---

Governor Flower, of New York, and Governor Pattison, of Pennsylvania, in their recent messages to the legislatures of their respective states, have something to say about labor troubles and military interference.

Governor Flower recites that to overcome 600 switchmen at Buffalo, who were fighting against the conspiracy of all the leading railroads in New York, to abrogate a law of the state, making eight hours a day's work, cost the state \$192,647. Having made this statement, he proceeds as follows:

Employes have a right to strike and peaceably persuade others to join them, and in their earnest and lawful efforts to benefit their condition they may always feel sure that public sympathy is with them and against selfish corporations. But every citizen and corporation, every employe and employer must observe and respect the authority of law and government. So long as they keep within the

law state government will leave them to settle their own disputes. But law must be observed, persons and property must be protected and the lawful use of property by its owners must not be interfered with. These are the ends for which the state primarily exists. For the maintenance of these ends every dollar of the state's money, the life and services of every member of the National Guard and the support of every law abiding citizen are pledged. It should be the aim of the law-making body to see that our laws confer equal privileges. It is not right that powers should be granted to corporations to oppress either their employes or the people. Whatever can be wisely done by legislation to guarantee equal rights to all should be done. But law will not accomplish everything. Corporations will learn by costly experience that even from a selfish point of view it pays to be considerate of the welfare of their employes. No men or corporations can stop the march of civilization. Fewer hours of labor, better wages, and the opportunity which these give for education and enjoyment are natural human aspirations. They should be treated as such in a friendly, Christian spirit; not repelled with arrogant manner or impatient consideration. Honest recognition by corporations of just demands from employes will solve many a labor difficulty, and prevent many an opportunity for lawless strife and civil disorder.

It so happens, that employes know their rights and dare, sometimes, to maintain them. Governor Flower rattles splendidly when speaking of obedience of the law, but he fails, as is usually the case in such pronouncements, to state that the Buffalo strike was the direct outgrowth of a conspiracy on the part of railroad officials, to violate the laws of New York, a crime which they successfully perpetrated for the purpose of robbing their employes; and, strange to say, Governor Flower seems to have no information upon so important a matter, but intimates that all alike must obey the law, provided every man in the state should be required to take aim and fire into the ranks of labor, while the other fellows may smash as many laws as they please and be protected in their nefarious work by the bullets and bayonets of the State's standing army.

There was, probably, never a more righteous strike than that of the switchmen; so popular was it with the people of Buffalo and of Erie county, that they absolutely refused to help the railroad authorities to succeed in their infamous conspiracy to violate the laws of New York, and hence, the calling out of the State Guard to aid the conspirators to secure a victory and crush workingmen; and it cost the state \$321.17, each, to overcome the 600 switchmen and give employers and scabs the victory.

Governor Pattison, of Pennsylvania, in his message, seems to be a little sick of the costly method of employing the State Guard for the purpose of helping the Carnegies and Fricks rob workingmen. He refers to labor troubles at Maywood and Homestead, where the State Guard was employed to enable Pinkertons, scabs and employers to secure victory. At Maywood the expense was \$35,350, and at Homestead, \$430,056, a total of \$465,408. Having given these figures, the Governor says:

There was no real effort made on the part of the civil authorities to suppress the disorder. The entire community seemed to surrender to the disorderly element. At the beginning fifty determined men, moved by a love of order and a patriotic spirit, would have suppressed this whole disturbance. I therefore suggest to the legislature that the costs in suppressing local disturbances in which the civil authorities call upon the military power of the commonwealth should be placed upon the county calling for troops. This may be an incentive to local authorities to take determined action in the beginning of a disturbance, rather than have their treasury mulcted in a large sum to pay the expenses. At least the state can make some such effort to prevent the often hasty and unwarranted call for the presence of troops. In this connection legislation should be had looking to the prevention of the introduction of armed bodies of men without the consent of the authorities of the county or state. The state of Pennsylvania already has a state police in the coal and iron districts.

Manifestly, an effort was made on the part of the civil authorities to aid Carnegie and Frick to rob their employes, but public sentiment was so pronounced and hostile towards the rich rascals that it became necessary to introduce the military machine, and with generals and colonels, pomp, circumstance and military display, indicate to workingmen that they could choose between retiring to their holes, or having their hides perforated with State Guard bullets and bayonet stabs. It is easy to see, however, that Governor Pattison is disgusted with the powder and ball method of quieting labor strikes, and if the local authorities must have the military machine, he wants those applying for it to foot the bills.

It will now be in order to hear from Tennessee and Idaho, two other seats of war, where the military machine has taught workingmen that the state and national governments, will upon the call of plutocrats, shoot them down as they would so many jack rabbits or prairie dogs. Generally speaking, men who have to work for their living make up the rank and file of the state's standing army, but it

would be better, seeing what use the army is put to, to let plutocrats and their sons do the shooting. It must be disagreeable for workmen to perform such a murderous duty.

---

## SENATOR CHANDLER'S SENSATION.

---

In the United States Senate, Jan. 7th, Senator Chandler delivered a speech against immigration, in which he declared, in effect, that "the North German Lloyd Steamship Company had, by the distribution of courtesies, acquired such influence over his fellow-Senators, over the Secretary of the Treasury and his chief subordinates, and over the newspaper press in general, as to make legislation restricting immigration only possible by the consent of the company. Mr. Chandler boldly stated that this particular company was the favorite of the Treasury Department, and that this company furnished leading treasury officials with transportation to Europe every summer, and had furnished certain officials financial advances upon which no interest was paid." Here we find not only the Treasury Department but the United States Senate, also, had been debauched by the German Lloyd Steamship Company, to the extent that necessary legislation in the Senate touching immigration could only be had by consent of that company. It will be interesting to note what action the United States Senate will take with reference to the scandalous charge, if possible more infamous than the Panama canal thievery which is giving France so much trouble just now.

Evidently Chandler knows what he is talking about and it is doubtful if the Senate appoints a committee of investigation to probe the matter, unless Mr. Chandler by further allusions to the outrage makes silence speak louder than words.

The United States Senate is composed largely of millionaire nabobs—men who by the use of money have secured the positions they *disgrace*—but though rich are still willing to sell themselves and their country to a foreign corporation. Such is the character of Chandler's allegations.

## EVICCTIONS IN NEW YORK CITY.

---

The sympathies of Christendom have been aroused by graphic descriptions of evictions in Ireland, and for the victims of landlord cruelties money has flowed in a steady stream for years past from the United States, to mitigate their sufferings. And when the people of the United States were satisfied that portions of czar-cursed Russia were in the grasp of famine, money by thousands and food by ship loads went forward. Such generosity is worthy of eulogy. It is eloquent of the great-heartedness of the American people, who hearing of woes in foreign lands immediately set to work to alleviate them. But while the great American heart was beating responsive to the calls for help in foreign lands it had no throb for the wretched creatures who, evicted from tenements in New York, were forced upon the streets to starve and perish—infants, youth, the old and the infirm, God-forsaken and forsaken by men, without sufficient clothing, foodless and shelterless—multiplied thousands every year are treated as if they were wild beasts or vagabond dogs. About this there is no mistake; the official records confirm the statement and the figures are appalling.

Manifestly, it does little service to this vast mass of suffering humanity to publish the startling facts, nevertheless it is well for the great body of American citizens to know "how the other half lives," and still better, perhaps, if they know why the "the other half" is doomed to live on the ragged edge of starvation during all the days of the round year.

It may be well to note in this connection that the congress of the United States appointed a committee to investigate the "sweating system," and to ascertain the surroundings of the miserable victims of "man's inhumanity to man," and not only to man, but to women and children. When that report is published we predict it will open the eyes of the country and permit the people to look down into the bottomless pit of suffering and degradation, and it is possible some good will result; but upon this point we are skeptical, because it happens to be a *state's right* to enact laws well calculated to robe heaven in gloom, by which one class becomes fabulously rich off of the tears and pangs and degradation of another class. In the cities of New

York, Philadelphia, Boston and Chicago the "sweating system" cries to heaven. It is a system written all over with the indorsements of the devil, and the dens in which it is practiced come nearer being hells than anything ever discovered by Milton or Dante; and it is this horrifying system, involving sickness and poverty, that contributes largely to the evicting business in the city of New York.

The tenement house is the outgrowth of our boasted civilization, and the same is true of the colossal fortunes which captivate beholders who visit Gotham—more properly the Sodom of the continent—where \$100,000 is contributed to furnish old Trinity church with a new set of front doors, while within the shadows of its steeples men, women and children perish for the lack of food, clothing and shelter, or live like vermin in tenement houses under conditions indescribably inferior to Vanderbilt's horse stables, or indeed, the average penitentiary.

These outcasts are the victims of the "sweating system," and of the tenement system, the twin monstrosities which disfigure civilization as leprosy does its victims, which bring religion into disgrace and compels men to wonder at the manifest indifference of an "overruling Providence."

A writer who has given the subject of evictions in the city of New York special attention and whose figures are authentic, says that from October, 1891, to September, 1892, one year, there were evicted in the city of New York 29,720 families, and that making the average five persons to the family, a total of 148,600 human beings were "made outcasts to all intents and purposes," and that, too, while "in a radius of a comparatively few blocks not less than two hundred millionaires resided, whose aggregate wealth amounts to not less than \$3,000,000,000."

Such things, we are aware, are thrust aside as of little consequence compared with the all-absorbing topics of the times, and yet they are claiming more attention now than ever before since the plutocratic class discovered that to rob those who work of not more than five cents a day created a fund swelling to millions of dollars annually, and since they could pursue their piracies and violate no statute, criticisms did not disturb the serenity of their minds. It is possible, however, that even in New York public sentiment may be so aroused that something may be done whereby the evictions of the poor and

friendless may be reduced in numbers and their sufferings abated; and it may be that the report of the congressional committee, when it is published, will let in so much light upon the sweating system abomination as will compel states and municipalities to act as becomes civilized communities, and put an end to the prevailing savagery which now disgraces them.

---

THE Texas legislature proposes to make it illegal for any corporation, whether domestic, foreign or alien, to own lands by fee simple, except such an amount only as is necessary for manufacturing, transportation, mechanical and other purposes for which such corporation is created; and no corporation is to own land in Texas, except such as are authorized to do business in the state. All corporations owning lands in Texas, in excess of the purposes for which the corporation was created, are required to alienate said lands to citizens of the United States within ten years, which, if not done, the lands will be forfeited to the state. Texas has land for the landless, and those who want farms can obtain them in that state at low figures.

---

THE *Statesman's Year Book* furnishes the figures showing the national debts of the world, as nearly as can be ascertained, the total being \$35,654,579,000, which draws an average interest of  $4\frac{1}{4}$  per cent., aggregating an annual interest debt of \$1,516,313,000. The largest national debt is that of England and her dependencies, being \$5,569,637,000. France comes next with a debt of \$4,982,849,000, and then Russia with a debt of \$4,869,768,000. The United States of America has a debt of \$1,462,800,000. These vast debts are largely the result of war, and army equipments, and, if ever paid, the money will come from the surplus earnings of labor.

---

THERE are portions of the city of New York where there are 350,000 inhabitants to the square mile.

# CONTRIBUTED.

## INDUSTRIAL CO-OPERATION.

BY T. V. POWDERLY.

In a paper on "Industrial Coöperation," in the January number of the *North American Review*, David Dudley Field presents some carefully expressed thoughts for the mind of the great reading public to dwell upon. While the article itself is entitled "Industrial Coöperation" it does not deal with that question except by reference to it here and there. It aims more particularly at the establishment of a system of profit sharing than coöperation. It is not to take issue with his views on coöperation or profit sharing that I enter upon a criticism of his effort, by no means. Recognizing that the very system he would establish is utterly impossible while our present competitive system exists, and realizing that the overthrow of the present system would bring into active working order the "commune," as he understands it, I do not see how he can advocate the establishment of a system of industrial coöperation while the tendency of the times is in an opposite direction and while he approves of the present order. Coöperation of the many, for the benefit of the multitude who coöperate, is not possible while we tolerate the formation of trusts which aim at coöperation of the labor and effort of the many for the benefit of the few. Let any establishment in the United States attempt to put in practical operation the plan outlined by Mr. Field and at once the other concerns, engaged in the same field of production, will combine, form a trust and do everything in their power to frustrate the aims and objects of the institution which hints at distributing the earnings of labor equitably among the producers. Mr. Field, like others who live far removed from the atmosphere that labor breathes, can see but one side of the question. He deals largely with the educated, the refined, the cultured and the wealthy. He knows nothing about the poor, does not become acquainted with the workman, who as a boy began industrial life in the mine, at the bench or on the track, at ten or twelve years of age. It would grate harshly on his ears to hear men murder the king's English in everyday conversation and he keeps as far away from such as possible. He evidently believes that for every strike, every act of violence that labor has engaged in, labor is alone to blame. He asks this question:

Are we any nearer a reconciliation between capital and labor than we were a decade ago? So far from it, there is apparently greater antagonism than there ever was, or rather, I should say, there is greater display of antagonism. Why is it so? Certainly men are improving in intelligence. Is it because the problem is unsolvable? This I do not believe. There are several reasons why the

progress has been so slow. \* The first and greatest is the action of the workmen themselves in resorting to violence and annoyance in order to gain their ends.

Here is where Mr. Field makes a great mistake. He did not trace cause to effect in arriving at that conclusion, for if he did he would have known that primarily the antagonism he complains of had its origin in the greed of the capitalist himself. He cannot be blind to the fact that no one man, working independently of others, can amass a fortune or even grow rich. He must admit that to enrich one man hundreds, if not thousands, must toil and devote the bulk of their earning to the enrichment of that one man. He may deny this, but the facts stand out so boldly that all may see them, that he who works by himself remains poor, and that being true the rich man who does not owe his wealth to inheritance must be rich because he either stole the money or became possessed of it through the labor of other hands than his own. There are many ways of stealing not classed as offenses against the common law. A man may cooperate with a half dozen other men in organizing a corporation, and after erecting the plant and stocking it with machinery increase the stock of the concern to three or five times the original cost. This stock when sold must pay a dividend some time, and in order to do so the wages of the workmen must be so thinned down that a dividend may be paid, not only to the six original investors but to those who hold the watered stock as well. This is recognized by law but it is robbery in the sight of the all-seeing eye of God as surely as if these six men put their hands in the pockets of the workingmen and took therefrom their earnings. A share of stock that does not represent an actual investment of the money it stands for is "bogus," it is as fraudulent in equity as a counterfeit ten dollar bill, for it tells a lie on its face. When men have to labor to pay interest on an honest investment of \$100,000 actually paid in, and on \$200,000 worth of bonds or stock based upon the original \$100,000, they have to perform three times as much labor as would yield an honest dividend to the owners of the \$100,000. That proposition is self-evident. It follows, therefore, that every twist of the brake, every movement of the scoopshovel, every action of the throttle, every stroke of the hammer or pick required to pay a dividend on stock, or bond, over \$100,000, is an effort put forth to pay those who hold fraudulent or watered stock. That stock did nothing to earn the money, those who have possession of it did nothing to earn the money, those who issued the watered stock did nothing to earn the money, and the man whose labor did earn it must look on while a drone appropriates it to his own use. There was a time when workingmen did not know how they were being cheated through watered stock, but they began to think over the matter and they saw through the operation. Seeing through it and realizing that the nicely planned schemes of extracting money from flesh and blood to pay dividends on water were wrong, they began to ask for legislation to undo the injustice. Among other things they demanded, and obtained as they thought, from the state of New York, a law limiting the hours of labor to ten per day on railroads.

They saw a great corporation that had grown up under the manage-

ment of the sharpest stock jobbers in Christendom (they have no stock jobbers to equal those in Christendom) violating that law. They saw the proceeds of their labor go in a steady stream across the Atlantic to enrich foreign capitalists and holders of watered Erie stock. They protested, they remonstrated and they agitated among themselves for a redress of the grievance. They demanded a compliance with the law of New York, and all of this time did not resort to violence. All of this time Mr. Field had no word of commendation for them or condemnation for the practices, the illegal practices, of the stockholders of the Erie. He, and the great public that gives its opinion only when it is wrung from it, remained silent and inactive, content to allow the law to be trampled on and the injustice to rankle in the breasts of the workers, so long as they did it peacefully and without disturbing the upper surface of the stream on which that class to which Mr. Field belongs were floating so serenely.

At Homestead a man stepped before the world and made the astounding admission that he would place a high fence around his works, cap it with barbed wire, charge that wire with electricity; that he would place hot water plugs at close intervals around his works so that he might meet his employes with boiling water when he felt like disagreeing with them. He told of his methods of civilization and all the world wondered. They were astounded, but not a man of that class to which Mr. Field belongs ventured to protest against the action of Mr. Frick. They say the strike is a relic of barbarism. I grant it, but what instinct of humanity actuated the man who deliberately planned the scalding of his workmen when he could not drive them into thinking his way? Was it humanity or barbarism that actuated him? I leave Mr. Field to answer.

The world looked on and saw an army of men, not sworn to allegiance as soldiers to state or nation, march on Homestead to make war on strikers. Their purpose was to provoke quarrels where none were intended, their mission was one of malice, they were hired butchers of men, and they took their lives in their own hands when they invaded Pennsylvania. Their masters admit that they were not sworn in, the whole world recognized the injustice of their engagement.

In Tennessee men are arrested and thrown into prison for being tramps and outlaws. The officers of the law are holders of leases for the convicts. They have it in their power to make convicts, give them long terms of imprisonment, and then take advantage of that long term in driving the convicts into the mines to do the work that honest men should do. The workmen petitioned peaceably, they remonstrated repeatedly, they demanded a redress of existing grievances, they acted as becomes loyal citizens of the republic, and went to the highest court of the state of Tennessee—the legislature. The whole world acknowledged the justice of their cause, no one even apologized for the infamous lease system, but they were repulsed, and then as a last resort made war on the system that drove them to poverty and hunger. Where was the philanthropic Mr. Field with his advice then? He cites these things in his *North American Review* arti-

cle, but only one side of them does he touch upon, and then in a half-hearted way attempts to pat the American on the back by saying:

How many American citizens were engaged in these disorders I do not know. A report of a speech made in congress states that in the crowd which insulted and abused the Pinkertons were foreign women and children. If these foreigners come here to break our laws we had better punish them first and then send them back whence they came. All these disturbers of the peace, foreign or native, acted in defiance of law.

There were many Americans in these conflicts, and each man of them appealed to the law before taking action in either strike. In Tennessee the majority were natives of the soil. At Buffalo the great majority of those engaged in the struggle were native born Americans. There is nothing in the penal code of New York or the statutes of the United States which fixes the length of time the patience of either foreign or native workmen shall continue to tolerate violations of law. When they do protest and their action is not even noticed, when they ask for redress and no voice outside of their own counsels will be heard, what are we to do?

In concluding his article Mr. Field says:

I have great sympathy with the workingmen, which even their outbreaks of violence have not extinguished, though they have saddened it. If I thought that the workmen would listen to me, I would say to them: Be brave, but be peaceable; you have in the ballot a weapon stronger than the sword or the right arm; remember that many a present millionaire was not long ago a workman like you; your surest reliance is on the sympathy of your countrymen, on prudent counsels and the rapid march of time.

It is something to know that we have the sympathy of Mr. Field, and it is consoling to be told that many a present millionaire was not long ago a workman like ourselves, but we cannot forget that the system which effected the sudden transition of workman to millionaire is at the bottom of the mischief which Mr. Field charges up to our account. If a few men could not so quickly become millionaires there would be fewer paupers and their numbers would not increase so rapidly, there would be more self-sustaining workmen and there would be no necessity for the sympathy which Mr. Field now extends to us. He tells us to use the ballot, and we point to New York, where the law which we had passed was violated until in desperation men struck. He talks to us of our violent act, and cannot deny the charge that corporate greed fired the line of disabled freight cars that made the presence of troops at Buffalo appear necessary. He tells us to wield the ballot, and in Tennessee we elect a legislature on an anti-convict lease platform, they meet, forget their obligations, because of the presence among them of the leaders of both parties who are financially interested in the perpetuation of the lease system. We do in all the states of the United States just what Mr. Field advises, we are enacting law, and all the while a greedy class of selfish money getters are setting aside the law.

Mr. Field advises coöperation, or profit sharing, but he must know that unless the workingman is admitted to the directorship of the establishment he cannot know what the profits of the concern are. If

the workman does not know what the profits are he can be defrauded under profit sharing as easily as under the present system.

Profit sharing will not undo the evil we suffer; coöperation alone will do it, but it must be a coöperation of the American people in the management of their industrial affairs.

Who has a better right to wear broadcloth than the weaver? Who is better entitled to wear neat fitting calfskin boots than the shoemaker? Who can claim a better right to a tall silk hat than the hatter? All of these tradesmen create but their creation goes to the adornment of others while they wear the cheapest. Who has a better right to the road than the man who uses it, who walks upon it? Who are they who use, who walk upon the roads of America? The American people. Who are they who own the great roads, the wonderful highways of this nation—the railroads? A few millionaire stockholders. Actual investment and watered stock are held above the reach of the worker who earns the dividends upon the stock. These railroads and the telegraph and telephone lines which run parallel with them are as essential to the being of the nation as are the veins and arteries in man to his very life. No man would think of entrusting the care of his arteries or veins to another, but we, the greatest and most progressive people on earth quietly allow the arteries of transportation and intelligence to remain as interest-creating machines in the hands of stock jobbers.

The readers of the LOCOMOTIVE FIREMEN'S MAGAZINE are, of all men, interested in the ownership and management of the railroads on which they offer up their lives to the nation's good. They, of all men, should be held secure in their positions, they should not be held to service without a chance of advancement or promotion, as many are at present. Under government ownership of railroads the employees will receive a higher rate of compensation with fewer hours of labor. We—by we I mean the American people—will not then be seeking for dividends on watered stock. We will be engaged in attempting to give the whole people the best service possible, and each man engaged on the railroads of the nation will be part owner. Under our postal system it was possible to reduce the cost of service while advancing the rate of compensation for employees. Postage fell from twenty cents per one ounce letter to two cents, and the wages of the letter carrier went up from \$30 to \$75 per month. What is true of the postal system may be made true of the railroad system if we bend our energies to the task in hand—if we but take the advice of Mr. Field and apply ourselves to the work of purifying politics and attending to legislation.

In making this my first bow to the readers of the LOCOMOTIVE FIREMEN'S MAGAZINE it was not my intention to take up so much time, and I hope to be forgiven for the transgression. While I am willing to be forgiven for the offense I am not so sorry for the offending as to say that I will not call again if the editor of the MAGAZINE will admit me.

## "SHALL THE PEOPLE OWN THE RAILROADS, OR--?"

BY CYRUS FIELD WILLARD.

No. 2.

[Concluded.]

The general public is as much interested as the railroad men themselves in the matter of whether the people shall own the railroads or the railways own the people.

This question is not over-stated. In no country save, perhaps, despotic Russia, can the sovereign raise taxes without the people having a voice in the manner and amount of tax to be levied. The railroads of the United States have a power to tax which far exceeds that of congress and they are responsible to no one save themselves.

"The public be d——d," said the representative railroad king, and so they are so far as being condemned to pay the rates or taxes fixed by the railroads. Under our system of indirect taxation, the increase in price of any commodity may be due as much to railroad tariffs as United States custom house tariffs. In one case the public gets it; in the other, they are damned and do not get it.

If for no other reason than that it is contrary to good public policy to allow a small number of private individuals to possess the power to raise enormous revenues by similar powers of taxation as those possessed by the general government, it does seem to me that it is wise for the people to own and operate the railways.

This power to raise great revenues means the power to debauch and corrupt the national, state and municipal governments. Few have forgotten the Credit Mobilier expose in relation to the Union Pacific railroad, which was virtually built by the United States government and given over by bought legislators to a private company, now bankrupt and dividend-squeezed, which should be compelled to give back its stolen property to its creator.

State legislatures without number re-echo the words, with variations, of Gould—"A Democrat in a Democratic district; a Republican in a Republican district; but an Erie man all the time." They have nearly all resounded with the charges of bribery, in which the railroads were the principal offenders. The Boston & Albany, in Massachusetts; the New York Central, in New York, the Pennsylvania, in Pennsylvania, and so on through the list of states, have had a grip on succeeding legislatures of varying political faith, due, as it has been openly charged times without number, to the corrupt use of money, influence and railroad passes. The mere mention of such scandals in the different legislatures would make a catalogue larger than this magazine, and, moreover, it is unnecessary to those who read the newspapers of the day and see how, from New Hampshire to California, the same story of railroad bribery prevails. Men in Massachusetts who have been members of the legislature, have told me privately what they received from different railroads for

their votes on certain measures, and in years when there were no bribery scandals, either.

In municipalities it is the same. There were two classes in the city government of Philadelphia for years—the Pennsylvania railroad men and the Reading railroad men. "Democrat" and "Republican" were not distinguishing appellations in that city until after the Reading had bought over some of the Pennsylvania men and won its point.

In Boston, in New York, in Baltimore, in Chicago and other cities, it has been the same story, so well known that it is unnecessary to go into details.

It is not to be presumed that the railroad officials take delight in bribing these members of national, state and city governments simply for the pleasure there is in it. They do it simply to protect their interests, and if we were in their places we would probably do the same, and, according to the commercial morality of the day, we would be fools if we did not.

This does not make it any the less wrong or immoral because they were forced to do it, and we would probably do the same. The underlying trouble is that the railroads are performing public functions for private profits, and as long as that is the case there will always be bribery and corruption. It can be laid down as a fundamental or axiomatic truth in sociology that any corporation performing public functions for private profits, will, from time to time, require extensions of its franchise or scope, or "favors," as they are naturally put. In order to get it the corporation is willing to make a small money payment now in order to reap a large money return later. This is business; as applied to public bodies having the granting of such favors, it is bribery.

The worst of it is, that the public itself furnishes the money to corrupt its representatives, and does not, as yet, see it. The money that the people pay in, in passenger fares and freight rates, goes to form the corruption fund. If it were not that the people had given these semi-public corporations the power to raise these numerous revenues, they could not corrupt the legislatures and the legislators would not be considered as such doubtful people as they are now.

Half-way measures will not stop it. The charter of the Boston & Albany railroad contains a provision that all over 10 per cent. dividends should revert to the state. Did the state of Massachusetts get a copper? Not much! After building elegant stations along the line and making an extra fine rock-ballasted road bed, writing off so much each year to depreciated rolling stock, materials, etc., and every way known to bookkeeping to increase the expense so the dividend would not go over 10 per cent., it began to reach the fatal limit where it would be necessary to pay something to the state and thus recognize a very dangerous principle. Contrary to the opposition of the press and the combined business and labor organizations of the state, a bill was rushed through the legislature increasing their capital stock \$10,000,000! Hundreds of such examples might be cited, but *cui bono?*

The continued existence of the railroads under private ownership is subversive of republican institutions. An oligarchy has been built up in this country which should be suppressed and its members banished as inimical to the republic. It is principally composed of big railroad owners who have used the great wealth obtained from their power to tax the people, to seize and monopolize other public functions. The enormous political power they possess is as dangerous as it is tremendous. They make and unmake congressmen, senators and even presidents. Harrison was corporation counsel for one or more railroad companies while United States senator, and their influence nominated him. Cleveland—well, I happened to be at the Chicago convention that nominated him, in the capacity of a looker-on, and I was told by friends of mine who were corporation men, that the railroads and Standard Oil men wanted Cleveland and they were going to have him if they kept the convention there a month.

This political power which is so dangerous to the public welfare, is dependent only on the money that comes to the owners of the road through their power to tax the people. It must be taken away and will be, and it needs no prophet to see that it will be, either peaceably or forcibly. It is just as likely to go the same way as the special privileges of the French seigneur in '93, though it is to be hoped the good sense of the American people will adopt the safe and easy plan of the ballot uncorrupted.

There are also many minor reasons why the people should own the railroads. Improved safety appliances, automatic couplers and grade crossings, are matters which affect the lives of the traveling public as well as the working railroad men on line service. They can only be generally adopted by governmental ownership. The varying heights of cars is one great obstacle to safety appliances, which can only be met by national ownership.

The delay in the transportation of persons and freight from strikes and lockouts would be done away with under national ownership and it would be unnecessary to call out the militia to shoot down poor switchmen instead of the officials of the New York Central, who caused the strike by violating the ten-hour law.

Less freight rates would be the rule, as there would be no inside ring of directors and stock manipulators looking for big profits. It is said that the government cannot do work as good and as cheap as private parties. This is a lie. When the government does its own work (not by contract for the benefit of thieving contractors), the work is far superior and cheaper in the long run. Ten years ownership and management of the railroads of the country by the nation, the people's corporation, would show that it could and would do the same quality of work or service at less rates than the private companies now do it. The power to ruin farmers in the West, and even business men in the East, by the ruse of "no cars," which has so often been played by some of the railroad officials working in collusion with elevator men, and other opposing interests, would also be abrogated. This is certainly a power which should not belong to a

few private individuals, and it is one which I can only glance at in passing in justification of the last part of the question in the title.

There is no question in my mind that there would be better passenger service than what we have now. More and better passenger cars would be the rule. This brings me to the monumental swindle on the American public—the Pullman palace car. This palace car service should be included in every first-class ticket sold. The public permit themselves—no, I forgot, the public be damned—but here is an inside corporation which has as its component stockholders, the big railroad men of the country, and this company is permitted to add to the already too high fare, \$2, \$3 or \$5 for the parlor or sleeping car service. Yes, I know their passenger service doesn't pay, that is, if you let their figures tell it. The sleeping car service should be included in the price of every first-class ticket, and the present system of a subsidiary company is, like the construction company, usually organized to get the first and biggest slice of the fat of the road until it gets time to "water the stock." This brings me to another phase of the subject, and that is, if the nation owned and operated the roads, its first work would be to

"Squeeze the Water Out!"

When we think of the millions of dollars that the people of the United States have been compelled to pay in passenger and freight so that the railroads could "earn" (?) a dividend on fictitious or "watered stock," is it not enough to make a few Anarchists, even of old New England stock like the writer? The men of 1776 picked up their muskets and fought against taxation without representation. Here, not only do we have taxation without representation, but we have robbery barefaced and impudent on the people, victims bound hand and foot by legal enactments passed by the tools and agents of the corporations in the several law-enacting bodies of the states and nation.

This brings me to the question, when the people do take the railroads, and it is only a matter of time, whether it would not be simple justice to take them away from their present holders without compensation in the same manner as one takes his property away from a thief when he finds it in the thief's possession. "The innocent third party" does not cut any figure if I find him in possession of my watch. The railroads have had their actual value paid for over and over again by the people, in the shape of dividends. The question will arise sooner or later, "How many times over do the present owners of the railroads want to be paid for the railroads before they will let go?"

Justice would say, as it does now, that the railroads should be taken by the people without further payment. There will be a number of people who will talk of "innocent (?) third party," the "poor (?) widows and orphans," who always invest in railroad and mill stock, and the hardships this would create. The people will probably have to pay for them again. In that case they only should pay an appraised value with the "WATER SQUEEZED OUT."

Senator John G. Carlisle, of Kentucky, who is slated for one of

Cleveland's cabinet, and who is either a fool or a—railroad director, was quoted by an Associated Press dispatch shortly after election, as having dumbfounded and silenced a deputation of farmers who wanted him to work in favor of the government ownership of railroads, by pointing out what an enormous debt it would create and how it would need piles of money to do it, and how it would be a sheer impossibility to pay even the interest on this debt. Being a newspaper man, I naturally do not believe anything that comes through the Associated Press. If by accident, the interview which went all over the country, really did occur, then Carlisle, who is well known as a grandiloquent old windbag, probably hustled down to the Associated Press office and up three flights of stairs or called it up by telephone, and gave only his side of the story, and the poor farmers got left. The article in question bore the ear marks of being "inspired," as the newspaper man sometimes terms the interview which a great man has with himself and then writes out for publication. I do not believe there were any farmers in that delegation but what could and did answer the shallow arguments he produced against it, and which, according to the dispatch, sent the farmers away silent and pondering.

He said it would take a tremendous amount of money to buy the railroads. It would not take one cent. The United States government could issue a 4-20 bond or a bond at 4 per cent. interest, payable in twenty years, and take in exchange the railroad bonds and stocks now out. It would simply be an exchange of one kind of bonds for another—United States bonds for railroad bonds. I guess the average investor who puts his money into railroad bonds would rather have United States 4 per cent. No money would be needed in making this kind of transfer. As regards Carlisle's statement that we could not pay the interest, why, we have to pay it now, and a much higher rate, too. We have to pay the interest on the railroad bonds and also dividends on stock of actual value as well as on "damned" watered stock. Can Mr. Carlisle tell what the difference would be in paying the interest to railroad bond-holders from paying it to the United States bond-holders? I cannot see anything except a saving in the rate of interest and a reduction of the principal or total debt by "*squeezing the water out.*" This would, undoubtedly, be the case if the United States took the roads at their actual value and issued bonds and scrip in exchange for the bonds and stock now out.

The schedule time is a minor matter, but it also could be made more nearly perfect if the people owned the railroads and they were under one general comprehensive management, rather than run as they are now by different gangs of train despatchers who will let trains of a connecting road wait for hours before giving them necessary information. The zone system as it obtains on the government railroads in Hungary, and which is one of the latest wrinkles or inventions in the railroad business, could also be introduced. Your readers are, presumably, all familiar with the zone system, so I will say nothing about it. The post roads were formerly owned by turnpike corpora-

tions and then the people assumed the ownership. The railroads are our modern postroads, and the courts have so stated. They in like manner must follow history and become the property of the people. This essentially public service cannot longer remain in private hands.

There can be no real civil service reform until you have a civil service. Take the number of those in the civil service as compared with the grand aggregate of employes in the United States, and we find they are a very inconsiderable percentage. The main idea of civil service reform is that a man should be retained in his position as long as he does his work well. Every member of a labor organization will agree with this idea. The only trouble is that it is used to keep the "ins" in and the "outs" out by the politicians. If the people owned the railroads there would be so many men employed, about 1,000,000, that it would make no difference with the individual's political beliefs, and the main idea of civil service reform, as above stated, would have an opportunity to work. It is said that if that big army of officeholders were to be added to those already in existence, it would be an impossibility to ever get that party out of power. I have purposely put this objection in its hardest form. To answer this, it is only necessary to say that the statement is an imperfect generalization from incomplete data. When the number of supposedly "soft snaps" or government berths are limited, every one wants one, and the fellow who gets one is going to hang on to it and not run the risk of losing it by trying to get something higher. Not so when there are lots of them to go around as compared with the average outside. The ambitious men in the railroad service would see that there was a change in the government often enough to enable them to get ahead. At any rate, this army, and there are about 500,000 voters, it is said, are not so dangerous to the republic as government employes as they are when influenced, led, bought, cajoled or intimidated by the millionaire railroad owner who now has his hand on the throat of this nation. The last election showed how unimportant the possession of the offices are, when the Harrison forces were so teetotally knocked down and trod into the mud. Besides, we now have the secret ballot.

The changes that would be brought about by the people owning the railroads would tend to put to work thousands of persons who are now permanently idle and are supported unproductively by some one. The cheap passenger rates then made possible would render possible an easy and scientific distribution of labor in all parts of the country, so there would be no glut here and a scarcity there. In fact, the ramifications of the subject really require a book in which to do it justice. I do not propose to say much more, other than to recapitulate the following reasons:

Railroad men need national ownership for the reason—

1. That it would increase their wages.
2. That it would reduce their working hours to eight per day in accordance with the national eight hour law.
3. That it will render their occupation less hazardous and

lengthen their lives, bring about safety appliances and better conditions generally.

The general public need national ownership for the reason that—

1. It is taxation with representation.
2. It is in line with good public policy.
3. It does away with the incentive to bribe legislators by taking away the necessity.
4. It purifies politics.
5. It permits the introduction of improved passenger service and general sleeping car system.
6. It would reduce freight rates and passenger fares, and
7. It removes the power of the railroad millionaire to meddle in politics and control the nation for his private ends.

These are in themselves only hasty generalizations, but the conclusions are logically deduced from correct premises. There are many more reasons that might be cited. I think I have given enough, however, to show that the answer to the question "Shall the people own the railroads, or the railroads own the people?" is: The people must, shall and will own the railroads.

---

## EPISODES OF 1848.

---

BY MARIE LOUISE.

### No. 2.

In the vicinity of the Palais Royal and the Tuilleries the troops still held fast for the government. Etienne Arago, Count d'Alton Shee, a Peer of France, Ferdinand Flocon, Arthur Dangeliers, the indomitable Caussidière, Arnold de Verchères and other Republicans, arrived to capture the last foothold of monarchy. Going to the officers of the troops of the Palais Royal, Etienne said,

"Retire, spare your soldiers and the people a useless sacrifice of blood. We are few before you now; in a quarter of an hour we shall be hundreds; in one hour, tens of thousands! Resistance is impossible!"

The officers remained obdurate. Arago and his friends withdrew to the other side of the barricades. They met General Lamoricière, who had just been appointed Commandant of the National Guard. M. Moreaux, an officer of the staff of the National Guard urged Etienne Arago to have the general recognized.

"General," said Etienne, approaching him, "there is no longer to-day any talking of reform or regency. This time we will have the Republic, and keep it."

To an incredulous shake of the head of Lamoricière, Etienne replied vehemently,

"Yes!" the Republic is ours, and no one shall tear it from our hands. You are a brave general, and soon you shall have your place at the frontier as a soldier of the Republic; but at this moment you would uselessly seek to be heard. Go no further, your efforts are futile."

The general and his officers turned round and went back to the Tuilleries.

The garrison had withdrawn inside of their post. A few lads made a rush at the gates of the Palais Royal. The soldiers in the post at once levelled their muskets and fired a murderous volley. The people who were armed returned the complimentary fire.

Mr. Percy B. St. John, who was an eye-witness of this last spasmodic gasp of the royalist army, gives the following narrative:

"The scene from this forward was of the most terrible description. As soon as I could look around me I saw that the whole Place was empty, while at the corners, behind, before the barricades, kneeling down, standing up, at windows, on the house tops, were the people.

"Volley after volley was discharged. The garrison fired several times with the utmost military precision. The people answered. Every now and then a small party, having loaded, would rush out in the middle of the place and fire at the windows of the post, never failing to leave dead and wounded on the square.

"Fresh crowds arrived every minute. I could see the combatants rushing down the rue de Valois, reinforcing the people, or filling the places made vacant by the dead.

"At the corner of the rue du Musee we were about twenty. Already one dead body lay at our feet; it was carried into a baker's shop and deposited on chairs. Another and another fell, and the boulangerie became an ambulance. In half an hour four were lying dangerously wounded by the side of the dead man, while three others were shot through the arm. Never do I wish again to see so murderous a fight. Not an instant did the firing cease. Each moment the people, more furious as they saw so many victims fall, redoubled in boldness. Etienne Arago advanced into the middle of the Place and fired at the Post; he then moved down to encourage those at the corner where I was, and then returned to the rue de Valois to join Flocon, who commanded that position.

"An episode which I saw, but scarcely noticed, is thus vividly described: 'A child, one of those admirable *enfants de Paris*, of which this capital alone supplies a type, and which the people have baptized by the name of *titi*, flew about the Place, animating the people and provoking the soldiers. Etienne saw him, alternately to his right, to his left, opposite him, and despite the gravity of his personal situation, he admired from the bottom of his heart the careless courage, the bold heart of the heroic child, whose shoulder had been cut by a bayonet or a ball, whose shirt was all bloody, and who, in the van, in the most perilous post, armed only with a sabre, and in a shower of balls, came to brave new wounds or an almost certain death; and all this because he had heart, because the smell of gunpowder was a loadstone, because, in fine, he was an *enfant de Paris*.'

"Meanwhile, by the Café de la Régence a dense crowd, utterly heedless of the proximity of the balls which seldom wounded save mortally, poured an unceasing fire so loud, so continuous, so frequent as to be absolutely stunning.

"To add to the confusion, a number of royal carriages taken from the stables of the Tuilleries, were dragged out on the Place and by aid of mattresses thrown out to the people from windows, were fired. The group among whom I was knocked at once at the the door of a small house which was occupied in the building of the post by a water-carrier. He came out with his wife and daughter, trembling and terrified. The people assisted them into the baker's shop, and then, having brought out his principle valuables, piled fagots from the baker's upon the straw mattresses and fired it all.

"Up rose a hot flame and a loud cry from the people for the soldiers to surrender, for that resistance was now madness.

"The garrison replied by a still more murderous discharge which, added to the exasperation of the multitude, who from behind the blazing carriages, from the barricades and windows, from the Palais Royal, now captured, poured volley for volley. Here might be seen a boy of twelve, with a musket too heavy for him to carry, kneeling down and firing from a cart; here peer, peasant, deputy, National Guards, journeyman and master, English, French, Poles, hustled together, all with one object—the insuring of popular victory.

"The scene was tremendous! The carriages had made a vast burning barricade from behind which hundreds of men poured their volleys on the post, which, though the soldiers must have been half choked with smoke, replied with even more fury than ever. The Place was obscured by dense clouds of vapor. Where I stood, within four feet of the post, the heat was awful. I could scarcely stand. The air was hot like the blast of a furnace, while a smell of gunpowder filled the nostrils. From the carriages rose up numerous columns of flame, ardent and red, like the blood which ran upon the pavement beneath, while several heaps of straw and wood were burning against the post itself, which had caught fire in two places. In the dim light which prevailed, the day being closed, the smoke of fire and gunpowder, the thousand heads of the people might be seen crowding the Place in blouses, uniforms, coats, armed and unarmed, while swords, bayonets and guns flashed in the lurid glare. The ears were deafened by the tremendous discharges from both sides, from the Valois barricade, from the Rohen barricade, from the rue de Chartres, from where I stood, from the windows, from the Place, from the Palais Royal, from the *Corps de Garde*, where still the already burning soldiers kept up a discharge—all were firing!

"Still the parleyers tried to make the firing cease, all in vain. In vain M. de Jirardin came down with the proclamation of the King's abdication; in vain General Lamoricière advanced sword in hand and commanded the soldiers to desist; they fired on him and wounded him in the hand. In vain the son of Admiral Beaudin rushed among the combatants crying, 'Louis Phillippe has abdicated!' Mistaken for the Duke de Nemours, he was only saved by three National

Guards from instant death. The soldiers and Municipals held out. Their obstinacy was now increased by the fear of revenge. Not one expected to leave the post alive if they surrendered—a fatal error, for almost to the last the people said they were, of course, acting from a mistaken sense of duty and should be forgiven.

“A short silence took place. During this pause the people crowded densely on the Place. A column of National Guards, headed by Captain Jonanne, and followed by Lépéré, of the *Réforme*, afterwards killed, scaled a barricade with Etienne Arago, rushed to capture the post and save the wretched beings within, with the nineteen prisoners of the people in the *violon*, whose cries of despair were clearly heard. The fire had completely wrapped the *Corps de Garde*, the cistern of the fountain had given way and flooded the Place with water, and the awful confusion increased every minute.

“The capture of the Tuilleries, of the Hotel de Ville, was reported and everybody believed the revolution was accomplished, when a furious discharge from every part of the post again renewed the bloody struggle. From this moment the scene was dreadful. The garrison finding the *Corps de Garde* too hot to hold them, tried to rush out at the gate, but were shot as they appeared. The blood of the people was up—the last discharge had changed their sentiments, and not one was allowed to escape. Every instant the flames increased in violence. Floors, roofs, furniture, everything was on fire, and, at length, an awful stillness prevailed. The firing ceased, for the garrison had all perished, victims of their own obstinacy. The rigid disciplinarian who commanded them was killed with a bayonet while attempting to escape.

“A moment of profound silence followed. Each man held his breath and asked his neighbor if it could be true that more than one hundred of their fellow creatures had perished in the flames, victims of a mistaken sense of duty. A feeling of horror pervaded the crowd and then the cry arose, ‘To the Tuilleries!’ Away rushed thousands of combatants. I accompanied them.”

When the commander of the Palais Royal garrison, on trying to escape, fell pierced by a bayonet at the gate, Etienne Arago was standing a few steps off.

Intensely sympathetic in his nature he instinctively placed his hand over his eyes to shield them from the awful sight. Intrepid as a lion was this short and sturdy man when fronting the foe, but to see a man struck down while he retreats, made his heart grow faint. Sterling and noble was his courage! He fought not to kill men, but to overturn systems, and the man who retreats has, for the time being, ceased to be the identification of the hostile principle. He becomes a limb of humanity, and nothing more nor less.

The crowd of insurgents, now victorious, was rushing to the Tuilleries to deal the Monarchy its *coup de grace*.

Etienne Arago followed slowly, untying as he went his neck cloth to bandage a wound he had just discovered on the back of his head,

by the blood gliding down his neck. The loss of blood and the want of food weakened him.

"I must get something to eat," he muttered, "it will not do for me to be fagged, for the work of the revolution is not yet done. The Tuilleries must be cleared of all the rubbish hanging on royalty, and the people's majesty must occupy the palace, were it but for a few hours, to assert their ownership of that accursed edifice, where for so many centuries Tyranny has forged chains to enslave the nation and gestated schemes to bleed and strangle it! The Tuilleries, that sumptuous den where wolves lie in waiting to devour the lamb, ought to be levelled to the ground and obliterated from the sight of generations to come!"

Revolving these bitter thoughts in his mind, Etienne Arago advanced slowly toward the rail enclosure of the Palais Royal, near the Place du Carousel. Arnold de Verchères, who was sitting on the stone edge of the gate, bandaging a wound he received in the left arm, saw him walk dreamingly and ran to him.

"Etienne," he said, "Flocon and the Count d'Alton Shee were here a few minutes ago, looking for you."

"Are they all sound?" inquired Etienne.

"They appeared to be all right. I saw no wound on them," answered Arnold, "but you, Etienne, you have been hurt."

"Yes, and you, also," replied Etienne. "My wound is not serious, and I hope that your own is also slight."

"A ball struck my arm," rejoined Arnold, "but the bone is not touched."

"So far we have been fortunate, have not we?" said Etienne, "and yet we stood in the hottest of the fire, where bullets rained all around."

"We are not yet through, comrade," said Arnold, "the Republic is not yet proclaimed."

"It will be," replied Etienne hastily. "Arnold, let us go and get something to eat, I am nearly starved."

"I am also very hungry," said Arnold, "I ate nothing since we had our supper this morning at two o'clock."

"Neither did I eat anything since, and we have done so many hours of mighty hard work. Is it not surprising what amount of hardship the human frame can stand?" remarked Etienne.

"Let us go around the corner to a little restaurant in the rue du Musee," said Arnold, "we must get a good dinner, for goodness knows when we shall be able to get another."

"What will you have, gentlemen!" asked the garçon, as they sat at the restaurant table.

"Give us anything you have ready," replied Etienne, "we are starved; we could eat an ox alive!"

"Don't eat me!" exclaimed the waiter, hurrying to the kitchen and turning round again and again to glance at the smoke-begrimed and uninviting faces of his guests.

After having partaken of a good broth and *bœuf à la mode*, and a bottle of good Bordeaux wine, our now invigorated insurgents called for a *gloria* (black coffee and cognac) and lighted their cigars.

"What a tough work we had with that garrison of the post," began Etienne Arago, "their obstinacy was astonishing. I feel all bewildered! That bloody work has saddened me! Yet I must not give way to emotion; I must go on, silencing my feelings until the task is done and the Republic is proclaimed from the Hotel de Ville."

"The scene of to-day has impressed me very painfully," remarked Arnold. "Did not the thought strike you, Etienne, that these Municipal Guards in the post were those you delivered from the mob yesterday, or some of their companions to whom they had related their experience?"

"No, I did not think of it," answered Etienne, "I don't believe they could have been, for had they been the same they would have spared the people instead of firing on them like mad men gone frantic. They were sworn on destroying the last of us."

"Poor unfortunate men!" continued Arnold tristfully. "They were crazed by the fear of falling into the hands of the populace. That is the secret of their frantic and obstinate firing. They were not afraid to die, Etienne. Their ceaseless fire poured on an enemy which so much outnumbered them and increased every minute, left them no doubt about their ultimate defeat and death. Even when Lamoricière shouted, and after him Baudin, 'Louis Phillippe has abdicated!' they did not relent the pouring of their volleys. I felt and still feel that these Municipal Guards were either those you saved yesterday or comrades to whom they related their terrible adventure."

"The men we saved yesterday, at the peril of our own lives, would surely not have kept on us such a murderous firing unless they were monsters of ingratitude," said Etienne, musingly.

"They were grateful to you, Etienne," rejoined Arnold, "but the populace has inflicted treatment upon them which stir every nerve in the human body and arouse in man's nature all that is bitter and implacable—treatments which degrade and humiliate and madden."

"I am a veteran revolutionist," said Etienne; "I have fought on the side of the people in the great revolution of July, 1830, and in all other outbreaks intervening between that and this present revolution, but I have never given a thought to the question you have just raised. I look at it this way: A man ought to be grateful when his life is spared by his victorious enemy. Would I have saved the lives of the Municipal Guards if I had suspected that my act was fraught with disastrous consequences both to the men and to ourselves?"

"I know you would not," retorted Arnold. "Of course no combatant expects courtesy during the action, and all strive to decimate the ranks of the enemy and save their own from destruction. A warrior hopes not for mercy from his adversary; sentiment is not in it. But when a warrior is disarmed he ceases to be the foe; nay, more than that, he becomes a defenceless man thrown on your clemency and caprice. You may kill him, for he is helpless; just as you may rob when property is entrusted to you. But where is the moral side of it? A war is a collective duel, and the point of honor (another word for moral sense) is in both cases—the individual and the collective

duel—exactly the same. What would the witnesses of two men fighting a duel say, if the conqueror were to rush on his prostrate foeman and hack him with his sword, or beat him, spit in his face and insult him by words? Would not the witnesses feel like killing him as an inhuman brute?"

So earnest and vehement was Arnold in his denunciation, that Etienne could not suppress a laugh, whilst his kind and honest but mischievous eyes sparkled with merriment.

"Arnold," he said at last, "you have never witnessed an unsuccessful insurrection. If you had, you would be more reconciled to the harsh ways used against the defeated. A civil war is the devil let loose!"

"As you state, I have never witnessed an unsuccessful insurrection," replied Arnold, "but the pages of history have pictured to me all the horrors and inhumanity attending on such disasters, and the matter-of-course feeling which prevails among the combatants. It is this very fact I wish to strip of all the fantastic draping the crafty spirit of oppression has wound around it and names 'war means,' 'war necessities,' 'war inevitabilities.' Since our social and our international conditions are such that war is inevitable, let us discriminate between fighting and murdering. On the battlefield, if I kill my adversary I assert my natural right to live and my capability to preserve that right. But when I have disarmed my foeman and he lies prostrate at my feet, if I slaughter him I am an assassin and a coward!"

"I agree with you there, comrade," said Etienne, "a disarmed man's life ought to be sacred to all. My heart bleeds when I see any defenceless being struck or abused. The cries of a whipped child or a thrashed woman, set me frantic; the blows that lash them seem to fall on my shoulders with tenfold severity."

"I know how sympathetic and upright you are, Etienne," rejoined Arnold. "For that reason I have linked my fate to yours during these three days of danger, determined to shield your life with my own. For that reason, also, I am anxious to point out to you the evil of the violence used yesterday by the people on your *protégés*, the Municipal Guards."

"The mob was infuriated by the brutalities these Guards had committed on them all day," replied Etienne, "you could hardly blame them."

"The Guards," retorted Arnold, "obeyed orders which are consequent on the wearing of their uniform—that of a soldier-police—a damnable combination! But the minute they were disarmed they became simply human beings, weak and helpless against the attacks of men armed and numerous. It was cowardly of the people to insult, and above all to strike them as they were marching in single order, unarmed and powerless even to shield their persons from blows. Not one of these unfortunates but would gladly have died twice in combat rather than suffer the agony they underwent for over one hour and a half!"

"I acknowledge that this treatment was ungenerous of the people," pleaded Etienne, "but they were maddened by the loss of their own brothers killed by Municipal Guards."

[To be continued.]

## YES! SCIENTIFIC TAXATION.

BY GEORGE C. WARD.

No. 2.

[Concluded.]

The December number of our MAGAZINE is at hand and has been devoured. I have been intensely interested and greatly edified in perusing its pages of delight and reading its able, humorous and aggressively humanitarian editorials. The MAGAZINE is simply immense. Long may E. V. Debs live to indite its pages and point a suffering humanity to the path that leadeth to industrial salvation.

I have read with amused interest Mr. W. P. Borland's second article under the caption, "Scientific Taxation?" and am "all broke up" to find myself convicted of woeful ignorance, and am humiliated and abashed to know that I have my "terms, rent, interest, wages, profits, cost, price, value, currency, money, circulating medium, &c., thrown together in such inextricable confusion as to obscure his (my) reason." In my lamentable ignorance I had supposed that cost and price were two distinct factors and that price included cost, interest, profit and rent. I thought, in my foolishness, that the conglomeration of ideas advanced by single taxers were based upon an inability to distinguish between money actually received (rent) as interest upon money invested in land and the increase in the selling price of land. I had hoped, in my verdancy, that some "sweet day" single taxers would be able to see much difference between land used for the production of wealth and land occupied for the absorption of wealth. My mental capacity is so weak that I actually supposed that because all rent upon business properties must inevitably be included in the price of goods and services sold, such rent must necessarily be an indirect tax upon the purchasers of such goods and services. This being the case, I am idiotic enough to believe that taking such rent as tax will not change its fundamental attribute of "indirect taxation."

Mr. Borland is simply trying to "darken counsel with a multitude of words" when he enters into a lengthy dissertation about cost, in an effort to disprove the assertion that all rent upon lands occupied for income producing, or profit making business, is an indirect tax upon the whole people. The proposition is extremely simple and should be very easily disposed of. I will formulate it thus:

First—Under the operation of the single tax (unlimited) the people would be the universal land owner and landlord, and there would be no individual landlords to tax.

Second—The rent paid by individuals to the people for the occupancy of land for profit making business, would necessarily be included in the price of the goods or services sold by them.

Third—Such rent, being included in such price, must inevitably be an indirect tax upon the people, such people being the universal landlord. The occupier of the land would be, not a taxpayer, but a

a tax collector, and would pay no more of such tax than any other person who consumed or used as many goods or services as he or she did.

Fourth—The only other tenable ground is that the occupier of the land would pay such rent out of a special fund, owned before going upon the land and set apart as a fund out of which to pay rent. Such an imaginative philanthropy is absurd and preposterous.

Fifth—Putting the proposition in the form of an alternative question, I ask: If rent is not an indirect tax upon all the people, out of what fund do landlords amass riches, and who produces the wealth landlords absorb, and—what are you kicking about?

Now, let us take Mr. Borland's own "formula." He puts it thus: "Any tax which increases natural price is distributed and becomes an indirect tax. It is impossible for a tax to become indirect unless it does increase natural price." Very good. Imagine, if you please, a block containing twenty business rooms, or stores, on the ground floor, with an average rent of \$1,200 a year for each store room. We here have an annual rental of \$24,000 a year, which the merchant tenants must include in the price of their goods, in order to be able to pay. Does not that increase the "natural price" (whatever the term may mean) by just exactly the sum of \$24,000 a year? If not, why not? And if not, how does rent rob and oppress the people?

Now, imagine another hypothetical case, as follows: Only nineteen of the store rooms are occupied by tenants and one by the owner of the premises. Does not this one man have a margin of profit, above and over the nineteen men, of just exactly the amount of rent each of the nineteen men pay? And could not a philanthropic single taxer, in the one man's place, close each and all of the nineteen men up, by refusing to include any rent in the price of his goods? And if all twenty of the merchants occupied their own premises, would not their competition soon eliminate the factor rent from the price of their goods, unless they formed a trust to keep prices up? And is not, then, non-occupying landlordism responsible for the factor rent? And would not untaxed enforced "use and occupancy," as the title to land, abolish rent and present forms of taxation, leaving revenue to be raised by a tax upon net incomes? And would not this method be better than the outrageously unfair system advocated by the single taxers, which proposes that the people shall continue to bear the burdens of rent (single tax), in order that the untaxed business exploiters and money mongers of the nation may continue to amass fortunes by virtue of the operation of the factors interest and profit? To say that they could not do it, is simply to assert that no tenant merchant, banker or business man ever did, or can become wealthy. Mr. Borland says: "We have seen that market price always conforms to natural price, and that natural price is identical with necessary cost at the margin of production; it is to the margin, then, we must revert." Bosh! Mr. Borland; pure bosh. The price of a bushel of Pennsylvania coal in Kansas, or a bushel of Kansas coal in Pennsylvania, includes within its limits a portion of the rent and interest paid and profits realized by every one who

handles it between the points, as well as the cost of transportation. The Kansas corn occupies in Pennsylvania much the same position that the non-occupying landlords occupy in our hypothetical block of buildings. Its "cost," not at the "margin of production," but laid down in Pennsylvania, gives the Pennsylvania farmer an opportunity to charge the same price for his corn, although it "cost" no more than the Kansas corn in Kansas, at the "margin of production." This makes Pennsylvania farm land as much more valuable per acre than Kansas land, as the sum upon which the difference in price of an acre in corn in Kansas and Pennsylvania will pay five per cent. interest. This is "economic rent." So much for cost and price. Mr. Borland's shoes are governed by the same rule, to which they form no exception. No man ever bought a pair of shoes, unless they were sold at a loss, that did not pay in their price a portion of the rent of every building they were ever in and the ground such buildings stood upon. As to the "margin." Mr. Borland will have to "get off the earth," in order to find a margin where "rent forms no part of such cost." Mr. Borland's error lies in the assumption that there will be individual landlords under the single tax regime. By the way, the "cost" of goods laid down to heavy buyers is the same in all parts of a city, yet a merchant upon a crowded, populous thoroughfare pays more rent, sells more goods and makes more money than the merchant on a poor thoroughfare, and yet the necessary price (Mr. B.'s cost) is much less on the poorer thoroughfares. What becomes of the statement, "Rent is not the cause of the higher price, it is the effect of the higher price which must prevail in order to cover the higher cost at the margin"?

Mr. Borland says:

But Mr. Ward don't really believe his own assertion as to a tax on rent being an indirect tax on consumption after all; he says:

"I have readily conceded that the trend of the argument seemed to prove that prices would be increased by just the sum of the tariff and revenue taxes, and all direct taxes levied upon buildings and goods, wares and merchandise. Indeed, as the 'rent or value (of land)' is the highest price that any one will give for its use, and the single tax takes all such rent as a tax; an addition to rent would simply be an increase of the tax."

After making this concession, there is no logical ground upon which Mr. Ward can place his assertion, that the tax on rent can become an indirect tax, and the attempt to maintain the assertion in the face of the concession becomes extra-logical.

What kind of logic is that which concludes that because I concede that under the operation of the single tax, the gross sum of taxation would be reduced by just the amount we now pay as taxes (not rent). I am, therefore, precluded from continuing to assert that the single tax levied (if farming afforded profits) upon all classes of land, except residence sites, would be an indirect tax upon all the people. (The tax upon residence sites would be in the nature of a tax upon incomes.) I yet assert that such tax would be an indirect tax, and would increase in amount as the pressure of population increased in intensity and men became willing to pay more and more

for the use of land. If the single taxers would acknowledge this, and claim that such fact, and the use of such fund (tax) for the whole people, would gradually establish state socialism, they would occupy more tenable ground and have a much stronger hold upon the affections of the people. Mr. Borland should cease harping upon the term "a tax upon rent;" the single tax proposes to take as a tax (all) rent and abolish private ownership of land. I am for the abolishment of the private ownership of land, by making untaxed use and occupancy the legal title to land, with a proper limitation upon the quantity to be held by each individual or family, for business, agriculture, or residence purposes. I am for the establishment of the Cherokee Indian system of land tenure in the whole of the United States.

The foregoing statement of my position should be a sufficient answer to Mr. Borland where he says:

But when we come to the land tax, Mr. Ward's science becomes particularly luminous. Here it is: "There should be levied a cumulative graduated tax upon all unused and unoccupied lands. No other land should be taxed." In other words, persons who failed to use their own lands must give up their rent for the benefit of society; but on the simple condition that they use or occupy their lands, they will be allowed to retain the rent which properly belongs to society, for their own benefit. This is science, indeed! but it is a kind of science which is idiosyncratic with Mr. Ward.

It will be noticed that here, in the compass of one short sentence, Mr. Ward both admits and denies an important ethical principle.

By appropriating all rent of unoccupied lands, he denies the justice of private property in land, which is just what consistent single taxers do, and by allowing all the rent of occupied lands to remain with their owners, when the owner is occupier, he admits the justice of private property in land, which is just what consistent single taxers cannot do. Mr. Ward will do well to square himself on this question; he must be able to give an answer, yes or no, to this question of ethics before he is competent to intelligently discuss the single tax economy.

I would levy the heavy tax upon unused and unoccupied lands, to force those who claimed it to relinquish title to it, the people being unlikely to resort to the expedient of confiscating to the state the titles to all land.

So far as is concerned Mr. Borland's statement, that "an arbitrary poll tax is the most inequitable tax that can be imagined, and has no scientific basis whatever," I answer, that with the abolition of all present existing forms of taxation, including the tariff and internal revenue taxes, a poll tax of two or three dollars per capita upon all independent individuals between the ages of twenty-one and forty-five or fifty years, would be both an equitable and a scientific way of raising sufficient revenue to pay for the protection afforded the persons (not property) by the several state governments. I reiterate: "The humblest and poorest citizen should receive the same protection and pay as much therefor as the richest and most arrogant." I am glad that Mr. Borland likes the tax upon inheritances, or estates. Mr. Gould's estate will pay the state of New York a tax of about \$700,000. If properly graded, such a tax should have received from such an estate as Mr. Gould's at least \$35,000,000, or one-half of the ill-gotten gains he left behind him. Mr. Borland says:

Experience has amply proved the inefficacy of the income tax, it puts a premium on perjury and places the honest and conscientious person at a disadvantage; it is not to be classed among the scientific taxes.

In answer, I reproduce from the article Mr. Borland is criticising, as follows:

I am aware that single taxers and others will contend that an income tax cannot be collected; that it will be fraudulently evaded or sworn off, or charged up to expenses, or be recouped in higher rents and prices, or lower wages, etc. To this I answer, that if use and occupancy were made a prerequisite to land ownership, there would no longer be any rent, high or low, while the competition of those business exploiters who did not receive any taxable income would prevent the income tax from being recouped in higher prices or lower wages. So far as evasion is concerned, the efforts in the direction of such evasion would be a matter of indifference to all those whose net incomes did not exceed one thousand dollars. An interesting struggle might be waged in the ranks of plutocracy, but labor would not be in it. Labor, being assured of its total product, free from rent and taxation, could look on serenely, while the plutocrats watched and fought each other.

If it would not be impertinent, I would like to ask Mr. Borland if, provided there were no taxes collected except on net incomes of over one thousand dollars, he would have any taxes to pay? The advocates of a graduated income tax occupy something like the following position: They claim, First—That as all wealth is the product of labor, if any other factor besides labor absorbs wealth, such factor must necessarily rob labor. Second—They claim that there is a point at which incomes cease to be the legitimate reward of honest labor and become the results of the factors which conspire to rob labor. Third—All standard works upon social and political economy teach that the factors which reap without sowing and absorb without laboring to produce, are economic rent (with all the term implies); all interest above an equitable proportion of the net product of capital and labor, and all profit above fair wages for labor performed and services rendered. Fourth—The advocates of a graduated tax upon net incomes hold that until speculation in land is abolished and land is held by occupancy only; until the people assume, as a public function, the banking business of the nation, and money can be obtained at the cost of such banking system; until one kind of labor becomes as honorable as another and the profits of merchandising afford no better wages than muscle and energy exercised in manual labor—until then all individuals should be entitled, above a good living, to a certain net income for a sinking fund for old age and all untoward contingencies, while those who amass wealth by virtue of the factors rent, interest and profit should be forced to defray all governmental expenses. Fifth—They hold that an individual should be debarred from piling up in a short life-time six or eight times as much as Adam could have earned in six thousand years, at five dollars a day, and to this end demand that the tax upon net incomes shall be graded.

The eternal verities of equity and justice teach that one man's work is worth as much as another's, and that brawn and brain should equally share the products of the exploits which brain conceives and

brown puts into execution. Above all, they demand that the platforms of the future shall not ignore the declaration, "Let him that will not work, not eat."

I will conclude with the hope that Mr. Borland will yet see the inconsistency of speaking of land as "man's heritage" and "God's free gift to man," and with the next breath gravely proposing to tax him for the privilege of using it. Make land free to all, untaxed, by use and occupancy. Give to every man a good living and a small net income, free of taxation. All above such living and net income will be the product of rent, interest and profit, all of which are equally robbers of labor. Make them defray all governmental expenses.

## SINGLE TAX FALLACIES.

---

BY W. H. STUART.

I desire to offer some arguments, ethical and economic, against the single tax, and invite its advocates to point out, specifically, wherein the arguments are defective.

What is the single tax? A proposition to tax all land, irrespective of improvements, to its full rental value, and the abolition of all other forms of taxation. It will be readily understood that to confiscate rent would be equivalent to confiscation of the land. Its advocates admit this, and defend it. Henry George, in "Progress and Poverty," says the object of the single tax is to make land common property, to accomplish which purpose he quite correctly states "that it is not necessary to confiscate the land, we can confiscate rent." When taxed with the evident injustice of this gigantic scheme of robbery, it is usual for single taxers to denounce rent as robbery due to the monopoly of national resources; that the landlord, as such, is not a producer, and is not entitled to a share of the wealth that he does not assist in producing. Granted. But rent is only one form of robbery. Any way by which one man is enabled to live, either partially or wholly, on the product of the toil of others, is as much robbery of the producer as the exaction of rent for the use of land. Therefore, the mere speculator, the cornerer of products, for instance; the landlord, the lendlord and the profit monger are all equally robbers of labor. And yet George, who so bitterly denounces the land robber, defends the money robber and his rent (interest) as the "just return to capital for aiding production." But let it be noted that capital itself is the product of labor, and in the hands of capitalists merely represents accumulated unpaid labor. That is,

the monopoly of land enables the owner to exact as rent all over the "margin of cultivation," while the monopoly of money and machinery enables the owners to exact as interest or profits all over the "margin of production." Readers of the defunct *Standard* will recollect how George defended "Old Hutch," who, a few years ago, cleared one or two millions by a corner on grain in Chicago. He (George) considered the operation a legitimate one, and had only words of commendation for the shrewd manipulator. Consistency may be a jewel, but it isn't found in the camp of the single taxers.

Therefore, I protest against the single tax scheme of confiscation as partial and unjust. While fully admitting that "rent is robbery," it is quite as respectable and justifiable as any other form of robbery. The title to land (in this country, at least) rests upon as equitable a basis as any other form of wealth. The "unearned increment" that the single tax is designed to confiscate has, owing to the common ownership of land that has obtained among us, been widely diffused, and of which all classes have been the beneficiaries. Thousands who have shared in this "unearned increment" are no longer land owners, but have exchanged their property in land into money and stocks, and are therefore enabled to live on another form of "unearned increment," which, by the way, under the benign single tax would go untaxed. Are those the people we will ask to assist us in robbing the land robber? The elimination of the latter class would not solve the economic problem, as I hope to fully show in a future article.

---

## THE COMING CIVILIZATION.

BY JOSÉ GROS.

No. 2.

One of the distinctive features of past and present civilizations is that the many have forever abandoned to the few the power of building up nations or concocting social compacts; and the few in question have always looked out for themselves in the concoction of laws. We must change that, if civilization is to change for the better.

Even in this nation of ours it is seldom, but once every four years, that we can really stir up the masses to earnest political action, or to some actual or supposed fundamental principle. Even then the agitation is apt to turn around men more than around principles; more around party traditions than around any specialized group of

laws. That is not altogether the fault of the masses; because we have not taught them how to discriminate between right and wrong laws. If we had taught them that, then governments would have long ago rested on sound principles of equal justice to all.

The worst is that the ignorance above indicated is found to permeate through a large portion of the so-called educated classes, far above what we mean by the masses, far above in human parlance. The writer imagines that God loves the masses better than the classes, although the latter contain, no doubt, many good elements.

We can notice that even among people high up in the social ladder, and good, nice people, too, many of them are totally at sea in connection with what is right or wrong in governmental action. For instance, such people, travel from city to city, and, of course, notice poverty here and great wealth there. They virtually attribute the accumulation of wealth to human laws, and the accumulation of poverty to God's laws. They are not conscious that they do that; but they do it all the same, through ignorance on God's laws of economics. They are so accustomed to see wealth accumulated under the action of monopolistic laws, taxing the mass of workers for the benefit of schemers, that they cannot realize how wealth can be created in any other way. They cling to the idea that government is something apart from the people, that capital is something apart from labor, that labor and capital can do mighty little but under the action of legislative acts in defiance of natural law. What is that but faith in the power of men's laws, and no faith in the power of laws divine?

The people in question notice a great railroad built up between two large cities, or a steam-ship line established between two seaports, through some governmental privilege, subsidy, or the like, and they say: Private capital would never have originated or made that possible. Private capital! Can we have any other kind of capital? Is not all capital the naked creation of labor? Can government create any capital? All that government can do is acquire capital through taxes, and all past and present methods of taxation have been taking a portion of what labor creates and saves. Capital is simply labor's savings, neither more nor less.

The idea that by taxing labor we can stimulate production and increase wealth or commerce! What an absurdity! The idea that some favoritisms to the few are necessary to the building up of a railroad, the establishing of a steam-ship line, the opening of a canal, digging artesian wells, erecting factories or mills, developing mines, &c., &c.! The conception that no such undertakings shall very well take place as the inexorable result of the intelligence and muscular power that we owe to God, of the natural elements that He has created for us! The assumption that demand shall not invite supply—that supply shall not meet demand! Are we not justified in saying that all that means absence of faith in the wisdom of God's laws, in the beauty of the divine organization through all phenomena, and a great deal of faith in men's laws of selfishness and sin? That natural freedom should disable labor and capital from healthy

development, and that only through governmental restrictions or favoritisms, and only through processes of legalized robbery on a gigantic scale should we be able to invite production and commerce! Can we conceive of anything more ludicrous than such human aberrations, entertained and proclaimed by many high up in wealth and intelligence?

All that must change, if civilization is to change for the better; and all that is already changing; changing among the masses, and changing among the best elements in the classes.

It looks as if the religious superstitions of periods gone by had simply made room for the economic superstitions of modern times. The old Greeks, the American colonists and other groups of men, had some clear perceptions about the benefits to be derived from at least a certain degree of freedom in production and commerce. Few nations, if any, in old periods, have considered taxation as a blessing indispensable to national happiness, as an incentive to the industrial growth among men, as a stimulus to healthy commercial developments. Why should we, or some of us in our days, consider most men to be like a pack of old donkeys, in need of the lash of taxes, to make them walk along the road?

The object of the preceding paragraphs is to show that even highly educated people can be subject to superstitions, and that even relatively ignorant people can be free from them; that even the former may have muddled minds on fundamental subjects, while the latter may have clear perceptions on the same. That would seem to prove that fundamental truth is essentially simple and perceptible to the average mind without the need of any college education or any elaborate process of mind culture. Judging by human history, it looks as if college or elaborate education tended to make fundamental truth less and less perceptible, to many minds, anyhow. Take human legislation in all nations, except with the old Greeks, and in the Mosaic laws, and you can notice that it embodies the most perplexing amalgamation of concepts and precepts, acting and reacting upon each other, impracticable by retail and by wholesale, specifically and collectively defying all natural laws, at war with the simplicity of every law in nature, repudiating the ethics of the golden rule, with mighty few exceptions, of course. We are willing to give men credit for having done some good. They would have been destroyed long ago without that.

Our aim is to prove that a new departure is needed for the coming civilization. Also, that the plain masses, the people at large, can and must take a direct part in that new departure. The fact that college men, and men with high culture, having controlled civilization for about sixty centuries, have done such a poor job, all along, as we have indicated, and as we all know to be the case, even the cultured men themselves, that plainly endorses the view that fundamental truth rests on simplicity, not on complexity; on few elements, not on many; on processes traveling along straight lines, not around the circle; on lines of least resistance, not along those of violence; on conceptions of universal freedom, not on those of oppression or

restrictions placing the individual in a straight jacket, so to speak. We can only conceive government under two general principles: 1st, Despotism or paternalism, reproducing each other, with a constant flow of laws or ordinances emanating from one man or a group of them. 2d, The reverse of paternalism or despotism, with as few laws as possible, emanating directly from the rank and file of nations, or as directly as possible, according to the conditions of the day. The latter was the principle of most Greek communities twenty-two centuries ago, as soon as they overpowered the oligarchies that now and then ruled for a while. Is it a dream to imagine that we can copy, and even improve upon, the system of the old Greeks?

We shall try to approach that subject very carefully, in our future articles. For the present let us cling to the perception of simplicity in fundamental truth, simplicity in all science. And the science of government is the simplest of all, as we shall have occasion to show. That being the case, there can be no trouble in the plain men of the people, and the plain women, too, for that matter, to thoroughly understand what is essentially right, or essentially wrong, in governmental functions; what corresponds to principles of justice or injustice; to ethics and sound sense, or to folly and national sin. Only let us remember that even fundamental truth, however simple in itself, requires, for its apprehension, a certain amount of mental work and love for truth. God gives nothing worth having without a certain degree of labor and love.

Now let us ask ourselves the following question: What is the use of citizenship when the citizen has no clear perceptions of what is right or wrong in national life? He is then a mere toy in the hands of the politician. If large numbers of citizens happen to answer to that description, what can then be the fate of any political system, even when resting on certain general conceptions of popular freedom?

On one hand, we can only have healthy nations through healthy individuals. On the other hand, we can only have healthy individuals through healthy nations. But can we conceive of a healthy individual who is not also a healthy citizen, with at least a somewhat clear understanding in regard to that which is fundamentally right or fundamentally wrong in national existence? Without a certain precise knowledge on the subject, on the part of most citizens, they themselves, their families, their earnings, their property, their joys in life, their manhood, is totally at the mercy of any set of men with cunning and selfishness enough to take advantage of the ignorance or folly of the rest. And there we have the only object of government—to prevent the few from taking advantage of the many; and that is why government is bound to be forever a failure as long as it does not rest on a few elements, simple enough to be apprehended by at least a majority of the people. And the very God who made the people made the science of government, adapted to the general conditions of the people, without the need of everybody being a regular professor or anything like it.

The general sequence of the above analysis is as follows: All social

and industrial disturbances are evolved and fed by governmental complexities concocted by the few for the benefit of the few. The coming civilization must reverse that. Government must be organized under the simplest elements possible, and under the perpetual vigilance of the many, that the few may never be able to humbug the rest. That requires that most of us should be round, symmetrical citizens, and so men or women in full; working for the evolution of a healthy, natural life.

## SHORT STUDIES IN POLITICAL ECONOMY.

BY WILFRED P. BORLAND.

### No. 2.

As capital is a portion of wealth, it is quite natural that the ambiguities which surround the latter term should attach to the former. The inconsistency with which the term capital is used is remarkable, even among persons who are regarded as authority. Professor Walker tells us that capital arises from the net savings of labor, and then says that land is capital; however, we are not informed how labor may save land. Professor Nicholson also declares that capital can only be accumulated by saving, and then includes both land and labor in his enumeration of the things which are capital; and the erudite Professor Sumner declares that land is capital, and then tells us that capital is the product of labor, but how labor shall go to work to produce land we are not informed.

We shall avoid all these inconsistencies if we are careful to remember that capital must be wealth. But it does not follow that all wealth is capital. Wealth is the larger term; it is the product of labor applied to land, and capital is that portion of wealth which is employed by labor to assist in the production of more wealth. Thus:

A farmer raises one thousand bushels of wheat: this is wealth; it is the product of labor applied to land. He saves one hundred bushels for seed: this is capital; it is the wealth which is to be devoted to the production of more wealth. He saves one hundred bushels for his own consumption: this is still wealth, but it is not capital; it is to be used for the immediate satisfaction of the farmer's wants, and not to produce more wealth. He sells eight hundred bushels: this may or may not be capital; it depends upon the use which is made of the proceeds of the sale. If it is devoted to

the purchase of food, clothing or other articles for the immediate satisfaction of the wants of the farmer and his family, then it is not capital; but if it is devoted to the payment of wages to hired help, the purchase of stock, machinery, or material for the purpose of improving buildings, fences, or making any other improvements which will aid him in the business or producing wealth, then it is capital. In like manner the stock of a merchant which is exposed for sale is capital; but that portion of his stock which he removes for the immediate satisfaction of his wants, is not. Thus capital is wealth, but whether wealth shall be capital or not, depends upon the uses to which it is put.

Those who speak of a man's labor or his talents as his capital, are making an incorrect use of the term. Labor is necessary to the creation of wealth, and so of capital; but it is not wealth itself, and thus cannot be capital. We employ steam engines to produce lumber, but we do not say that the engine is lumber. We employ labor to produce wealth; shall we say that labor is wealth? Land and labor are the two necessary factors in the production of wealth: capital is merely a contingent factor; capital has, heretofore, been given too prominent a place in the business of production. The current economic doctrine concerning capital is:

(1.) Capital supplies the materials which labor works up into wealth.

(2.) Capital supplies or advances wages to the laborer.

(3.) Capital supports labor during the progress of wealth production.

(4.) Capital limits industry. This is a consequence of the three former propositions; that is to say, that until capital is willing to furnish the materials and wages for the laborer, and supply him with necessary food and clothing, he cannot work, but must remain idle.

These propositions concerning capital are advanced by the very men who tell us that labor produces capital, and to a man up a tree it looks very much as if they were putting the cart before the horse. To say that labor produces capital, and then to say that labor cannot produce at all until capital furnishes the opportunity, is not good logic: it is putting the product before the producer. As a matter of fact, capital does not supply labor with the materials for producing wealth, nor does it supply labor with either subsistence or wages. The materials for producing wealth are supplied by nature, and capital assists labor in working that up. But such materials, when partially worked up, and while still in the course of exchange, are capital. The subsistence and wages of labor are created by the laborers themselves. But surely, it will be said, in performing such work as the building of a tunnel, or a railroad, where work must be carried on for several years before any revenue can be realized, it is necessary for capital to advance to labor both wages and subsistence. Let us see: The railroad or tunnel company start in with a certain amount of capital—or what amounts to the same thing, its representative—in the form of money; they employ workmen, who go to

work producing capital in the form of railroad or tunnel. At stated times the workmen receive their wages; but these wages are not advanced by capital. The value of the partially completed railroad or tunnel counterbalances the value of the wages which are paid to the workmen: the workmen have added to the company's capital a certain amount of tunnel or railroad, and have received from the company a certain amount of capital, in the form of money. The company's capital is not even momentarily lessened because of the payment of wages, it is only changed in form. This can be clearly understood when we remember that the performance of labor always precedes the payment of wages; also, that the capital stock of such companies does not decrease during the progress of the work. While the company is paying out capital in the form of money, it is receiving back capital in the form of railroad or tunnel. What is true as to wages is also true of subsistence. It is not necessary that capital should accumulate subsistence sufficient to maintain the workmen while such work is going on; it is only necessary that somewhere within the circle of exchanges there shall be a contemporaneous production of the things necessary to the support of the workmen, and a willingness on the part of such producers to exchange, with these workmen, these things for the product of their toil. Place one hundred men upon an uninhabited island; will it be necessary for them to accumulate a stock of provisions sufficient to last them an entire season before they can go to work tilling the soil? I rather think not; it will only be necessary that fish, game, berries, etc., are so abundant that the labor of a part of the hundred will be sufficient to furnish enough of these for the maintenance of all, and such a sense of mutual interest as will lead those who in the present get the food to exchange with those who till the soil, with the object of securing an increased product in the future.

Labor produces all wealth, and so all capital.

Labor produces its own wages, and its own subsistence.

There are important consequences, for workingmen, flowing from these propositions, which will be touched upon in future articles.

[To be continued.]

### WHEN YOU ARE OLD.

When you are old, and I am passed away—  
Passed, and your face, your golden face, is  
gray—

I think, whate'er the end, this dream of mine,  
Comforting you, a friendly star will shine  
Down the dim slope where you still stumble  
and stray.

So may it be; that so dead yesterday,  
No sad-eyed ghost, but generous and gay,

L F M 4 Feb 98

May serve your memories, like almighty wine,  
When you are old.

Dear heart, it shall be so. Under the sway  
Of death the past's enormous disarray  
Lies hushed and dark. Yet, though there  
come no sign,

Live on well pleased! Immortal and divine,  
Love shall still tend you, as God's angels may  
When you are old.

— W. E. Henley in *Scot's Observer*

# MECHANICAL.

## PUT A HEAD ON HIM!

BY THOMAS PRAY, JR.

It is a somewhat curious matter that the very first inquiry from a fireman is not a technical one nor a mechanical one, in effect.

"What are the three most essential things towards which a man, wishing to get up in the world, should direct his attention and efforts?"

His character, his reputation, his self-respect, in my own opinion; or to say it in another way, his honesty, sobriety and truthfulness, are the most potent factors in his life's work, by which and with which to make his way in this world and to insure his clear way in the life to come. There are so many things included in this that it is hardly possible to take them up in this place, to do it fully, but there are some things that may, with propriety, be said, as to influence some few of the many.

A young man is always the object of suspicion, in many ways, until he has established his standing; and little things are noted by older ones; his ability to stand sarcasm from those who are wild, his integrity and his care of his person, as well as whatever he is intrusted with, of other people's property or interests; then his being prompt, watchful, and at his post always and in his full mental condition, to attend properly to his duties. These are the most important of all, but there are other matters that enter into his daily life that he does not want to forget; one of these is the use of profane language. It is no credit to any one to indulge in any talk at any time, and in any place, that he would not give vent to in the presence of wife, his mother, or his "best girl;" and when a man, old or young, has this one thing thoroughly in his actions, day after day, he is safe from one of the most pernicious of habits of the present day. This is said with only a selfish application. Morally, no one can afford to violate common decency or to foul his mouth with any word that he could not utter in any place on earth, and this is often violated in many of our journals, in a covert way, by saying that "cuss words" were thick, etc. It is a practice that one can afford to drop with profit to himself and credit to his judgment.

Sobriety is an item that too many do not place proper value on; its violation is the most expensive of all vices, the most dangerous of all habits, the most vicious of all pastimes (?) in which to indulge, and the one thing that is surer than death to wreck any and all, mentally, morally and eternally.

Honesty is at once the easiest, the most certain and the most ad-

mirable of the various traits a man can cultivate, whether he is rich or poor, and when he has come to be known as an honest man he has made a stride up, if unconsciously so, that he will not only never regret, but he has only to continue in the same way, and so far as the honors accorded to any one in this world go, he is sure to have his share of them. Let a man, as early as is possible, after he attains his majority, establish his reputation for reliability as one of the most important actions it is possible for him to perform. Let him, in all things, obey the civil law, and if he goes a step farther and makes his peace with his Master, in matters divine, he is safer than relying on or in himself; and it is a queer fact that in many of the untimely deaths we hear of or are called on to witness, that regrets come, in a vast majority of cases, too late, and men who have too long violated the Moral Law, in their extremity, turn to some one to help them when life is measured by moments or hours. It is better to do this in time and in strength, and to do it each day of our life. This subject will do to think over and upon, but no one can do it for other than himself.

"What is an Eccentric?"

An eccentric is not a crank; it is a disc having its axis of revolution out of its centre of figure so far as its mechanical properties are defined. In its uses to move the valves on a steam engine, the motion of an eccentric and that of a crank, are the same if they have the same "throw."

Eccentric means out of centre, and is from either Latin or Greek. Deviating or departing from the circle or center. Not having the same center. As the shaft hole has not the same center as the outer circle, or the larger circle has not the same center as the shaft hole, the two circles have not the same center, and are, therefore, eccentric.

"What is the right speed for steam in or through the ports?"

Rankine laid down the rule that one hundred feet per second was as fast as it could pass with regard for its highest efficiency. Mr. Geo. H. Corliss, in his lifetime, paid strict attention to this one feature, and settled on six thousand five hundred feet as the limit at which he could make it efficient. And in some of the most important trials of steam engines in the last few years, it has been demonstrated over and over, that much higher speed than that has shown a loss of efficiency far greater than any gain in other respects. It is safe to build on, to work with and to get all that can be had from the steam, but like all other rules, it is subject to some modifications, especially on a locomotive, where the opening is very different at times from others. Get as near as you can to the rule, and it will pay you to make some effort to do this, for it is the vital part of a valve motion and a coal pile. Do not follow any rules that sacrifice the areas of steam ports to ideas of travel, or getting a certain size of engine from any one motion.

Sand between the Driver and the Rail.

"Our Boys" all know what it is that makes the rail bright and at the same time make the driver attend strictly to business. In the affairs of this world's work it is the sand that makes men with a big M, and it is traveling on the same line, and frequently, that

makes men able to cope with the problems with which they deal day by day. The attrition between the wheel and the rail is what happens to us in our daily life; the contact based on our rubbing against other men is what makes us either brighter or duller as we make use of it. If we use the means our Dear Master has to each one given, to the best of our knowledge, we can not come into contact with others without taking on or given out some benefits, and although it is in small amounts, each one adds to our general information and to our capabilities; and in this way we aggregate in a few years, if only we are close observers, an amount of real information that will aid us in any place to which our calling may lead us, whether for pleasure or in pursuit of our daily duties in earning our bread and butter. Life is not made up of monuments in size, but of little things of more or less importance, that in the aggregation, fill for us each a place for which we are better fitted as we are able to take on more from each one with which we are put in contact in our calling; and as we are to do this, it is, as a matter of business, better that, if done at all, it shall be well done. Think of it, try it, and keep sand on hand and then make the best use of it possible, remembering that each day is done for good or ill, as your task for that day is done. You cannot live over a single day of your lives nor undo your mistakes; then live, each one to the best of your ability, and have as few regrets as you can at the "end of the run."

---

## PRACTICAL TALKS TO YOUNG ENGINEERS.

---

BY L. B. MOORE.

No. 2.

The quotation referred to, viz: "Engineers are born, not made," was made use of by an eminent railroad manager in a communication to his engineers, in connection with which he stated that but a small percentage of firemen developed into efficient engineers.

If this quotation is correct the outlook for the present generation of engineers is discouraging, to say the least. It is not a pleasant thought that after years of patient toil and aspiration to the successful management of an engine there is great probability that you will be a failure, and after the best part of your life has been wasted you will be compelled to look for employment which does not require so high a standard of intelligence.

I must take exception to this quotation, believing it to be misleading and injurious. There may be some of you who, being familiar with it, share the opinion of its author that it is necessary that you should have especially developed faculties, lacking which you will fail of the attainment desired. If engineers are born to the

profession it would seem that our future motherhood should, by ante-natal forethought and meditation, so mould the minds of her children that prodigies in the service would be the rule instead of the exception. It would certainly be most convenient for the embryo engineers in lessening their personal efforts to attain to a high degree of efficiency, but our parents are made responsible for enough of the shortcomings of their children, without being made the authors, primarily, of the many failures that occur in locomotive service.

In this hustling age of railroad progress there must be a great demand for a higher standard of engineers. With the great increase in mileage, the new improvements and the rapid transit that is demanded by the public, there is a necessity for greater tact, finer judgment and keener perceptive faculties than ever before. It rests solely with yourselves to either improve or deteriorate, for there is no middle ground for any of us.

It is not to be understood that any one, regardless of mental qualification, may be a successful engineer, for there are those who will at best be "hewers of wood and drawers of water," but we assume that you to whom we speak are men of good intelligence, with average mental qualifications, only requiring the opportunity to develop them, and it is this mental culture, this higher education that the engineer of to-day stands in need of.

It is a generally accepted idea that one must wait for experience and practice to teach that which may be easily learned by observation. It has been demonstrated many times that "experience is a dear teacher," as many have learned to their sorrow. The failures of others furnish object lessons in the average fireman's experience if he would note them and thus learn to avoid the circumstances which caused them.

I think the greatest lack among young men is a want of combativeness, that mental motive power from which emanates a determination to overcome difficulties and excel in their chosen vocation. There are those among you who lack appreciation of your responsibilities; others who are self-sufficient, who would "call down" a fireman for interfering with your business; another class whose apathy for improvement is only excelled by their desire to avoid mental worry or physical fatigue; who, in fact, are possessed of a continual weariness which precludes the possibility of advancement.

He who believes that "all things come to him who waits," without special effort, waits till the world gets away from him, loses his position and is relegated to a place among that surplus we read about which the laws of supply and demand won't have anything to do with because of inferiority. The management of railroads are looking to the younger element in the service to take a first place in the procession and maintain it, keeping pace with the progress of the age. We who have been at the throttle for years will soon be back numbers, and the present and future generations must advance further in mechanical improvements and practice than those of the old school, and the desired end may be attained, with a knowledge of your deficiencies, by learning to improve those faculties in which you lack. We un-

derstand that by the constant exercise of the faculties they may be developed to a high degree. Our perceptions, memory, caution and judgment may be cultivated by noting existing circumstances and conditions, reasoning from effect to cause and arriving at a logical conclusion of the proper methods to apply.

You may think that, possibly, I have digressed from the practical to the speculative, and that this talk has been more of a sermon than a practical talk to young men; but we are standing on the threshold of a new year crowded with opportunities for advancement. What is the matter with taking advantage of them? At the beginning of the new year you have possibly made resolutions for improvement. Why can't you add another just as well as not? Let it be that 1894 shall find you further advanced mentally than you are at present. Get a good book on practical engineering, read it, and it will stimulate you to investigate mechanical ideas and apply them to practice. While practical knowledge of locomotive management cannot be learned from books, because of varying conditions in the service, you may, by reading books, put yourself in communication with the advanced thinkers of the age and obtain ideas that will benefit you. What is the matter with turning your lodge and division meetings into schools of instruction once in a while, that by interchange of thought you may get practical ideas from practical men? If others won't take kindly to it, but prefer routine business, get up and ask some question yourself. You will find those present who will take it up, and the desired result will be attained.

---

## MYSTERIES OF VALVE MOTION.

BY WILLIAM WEILER.

---

The January issue of the MAGAZINE is at hand, and is a striking evidence, in appearance, typographical "make-up," and contents, that the new volume just commenced will be the best ever issued, if by any effort it can be made so. The Mechanical Department is especially interesting by the variety of its contents, some of the articles being from among the most prominent railroad men in the country.

To the student of locomotive machinery no more interesting subject can be mentioned than valve motion, which forms the text of Mr. Sinclair's able article in the January number. Perhaps the interest shown in it is enhanced by the problems involved, which partake of the nature of a puzzle and thus enlist our minds in a contest to solve these apparent enigmas, which it seems have been "bothering" some of our best men, and which even Mr. Sinclair frankly con-

fesses he did not feel able to write about after years of practical railroad life, and which he wrote about "with much humility," after devoting four months of special study to the subject. When a man with the mechanical ability of Mr. Sinclair is led to confess that years of practical experience had not given him a full knowledge of valve motion, it behooves some of us to "go a little slow" before we "set up to know it all," and it goes to prove that earnest study is needed to master the subject. While it may not be essential to enginemen to have this knowledge, it may prove to be a good accomplishment to them at a very unexpected time.

With all due respect for the opinions of Mr. Sinclair, I cannot concur in his expression that "A man may be a successful engineer and not know how the steam gets in and out of the cylinders," except it be qualified by the addition of these words: "but he would have been a greater success had he understood the mechanical principles which govern his machine," which, as I take it, is what Mr. Sinclair really means, for I see he does not recommend firemen to "go it blind," but urges the necessity of acquiring all the knowledge possible, to enable them to prove themselves master workmen in their calling. In order to do this they have to avail themselves of the experience of others, as left on the record in books and periodicals, of which we trust the back numbers of the MAGAZINE form no unimportant part, for many of the problems have been treated in an exhaustive manner from different points of view and experience.

---

It is generally admitted by all that "causes produce effects," and if this is true it must also be true that "effects have causes," and while it appears to be also true that locomotives built at the same shops, from the same patterns, by the same mechanics, show a marked difference in their manner of working, there must be a cause somewhere to account for it, for otherwise they would be alike. We are not ready to accept the theory of a spirit being infused into our machines and making them smart or indolent, quick or slow, strong or weak, "as the spirit moves them," and hence we must look to material causes for the difference in behavior, which may be so slight as to easily escape notice, but which we believe must exist, and would, if discovered, account for what now seems a mystery.

---

The following in relation to speed is copied from the *Railroad Employee*:

There are two men in the United States who have reason to feel as proud as any one in this world of ours, and they are the engineer who has made a run of two miles at the rate of 97 miles an hour, and Mr. Vaulain, the inventor of the locomotive capable of making such wonderful speed.

Henry Beck is engineer of No. 385, running on the C. R. R. of N. J., between New York and Philadelphia, a distance of 90 miles, on a schedule time of two hours, and he had already made a record of a mile in  $39\frac{1}{4}$  seconds. The day on which this and all the world's records were beaten was most unfavorable, it having rained in torrents up to an hour before the start, and a high wind blow-

ing all the time. No preparations were made for the test, the train, as usual, consisting of four cars—two day coaches, a Pullman and a combination car.

The fast time was made between Fanwood and Westfield, the first mile being in 37 seconds, and the second in 38 seconds, or two miles in 75 seconds, or at the rate of 97 miles an hour. Between Somerton and Parkland, a distance of five miles, was also made in 205 seconds, this being the world's record for five miles.

The engine making this phenomenal performance was built at the Baldwin Locomotive Works, under the direction of Mr. S. M. Vauclain, the inventor and superintendent of the works. It is a compound, weighing 123,800 pounds, tank capacity 3,500 gallons, with 78-inch driving wheels.

Mr. Henry Beck and his fireman, David Blake, have a perfect right to crow a little, but not strange to say, when you know engineers—they are as modest almost as if they ran a slow freight.

About the same time that Mr. Garaghty was writing about the difficulties in the way of attaining high speed, the above paragraph shows that others were proving that even our present locomotives and tracks were capable of a speed of nearly 100 miles per hour, and that 90 miles per hour has been accomplished during a five mile run, and as the engine did not fly to pieces or come to grief it was only a question of suitable track for a longer run at the same speed. The best proof is performance, and as we have reached 97 miles it is only a question of a short time until we shall reach and hold the 100 mark.

---

### SOME QUESTIONS.

---

MR. EDITOR:—I was recently asked by a fireman to explain to him, through the MAGAZINE, why it is that when an engine is running at full speed in forward motion and you put her in back motion, she continues to run forward? This is too simple to discuss, but I will say to him that it is due to "momental inertia." Of course the earth does not move, and, therefore, the engine has to. Here are some questions for firemen to answer; they are practical ones and of much benefit to firemen expecting promotion:

Why is it that the pin in the link saddle is not put in the centre, as the pin in the link block is?

Why is it that some times when you fill the lubricator, and allow it to stand awhile before using it, you find it has nearly emptied itself? Where does the oil go to and what is the cause of its disappearance?

If your engine should die out on the main line, and you had about twenty pounds of steam, injectors, tank valves and hose, air tight, could you fill her boiler without getting her hot or bailing up? Certainly you could, but how?

I am much pleased with the MAGAZINE, and wish it the largest measure of success for the new year.

*Thomas P. Knapp.*

## A QUESTION BOX.

MR. EDITOR:—I was much interested with Mr. Pray's excellent suggestion in the January MAGAZINE. By all means let us have a question box. As to the details of conducting such an institution let me suggest as follows:

Let those who desire information on any mechanical subject send their questions to the editor labeled "For the Question Box." Then let the editor make a sufficient number of copies of such questions so that one may be sent to each person from whom answers are desired, the editor to be the judge of this, and not the person asking the question. Then let the questions be sent to the persons whom the editor may select, by mail, and when the answers are received let them be published, in connection with the question, in the next succeeding issue of the MAGAZINE. It would seem to me a good plan that such matter be arranged under a standing caption, "The Question Box," and my plan would be to publish both questions and answers without signature, so that those who asked the questions could not know from whom the answers came, and those who answered could not know from whom the questions came. The matter could be arranged under the above caption something as follows:

"We have received the following for The Question Box:" Then would follow the questions numbered 1, 2, 3, etc. "To which the following answers have been received." Then would follow the answers to correspond with the questions.

By this plan perfect incognito would be preserved as to the contributors to "The Question Box," and there would be no excuse for the very natural diffidence which most persons feel towards having their identity known in connection with such matters. Again, a great deal of useless controversy would be avoided. It is very dampening to the ardor of an aspiring controversialist to be unable to take issue with even so vague a person as "X. Y. Z." or "P. D. Q." And again, many persons would be induced from the very novelty of the plan to ask questions which would lead to the publication of some valuable information. I feel quite certain that there are many firemen and engineers who do not ask questions because of the fear that their identity may be discovered and they be taunted by some of their fellows with foolishness.

Persons asking questions should confine themselves as far as possible to subjects of practical importance to enginemen, and avoid both unimportant and abstruse subjects. Of course it is not possible to strictly draw the line in such matters. What may seem important to one person will not be so to another, but persons of ordinary intelligence should be able to comprehend the fact that they should not occupy space with such questions as "What is an eccentric?" or "Is the fulcrum of a locomotive driving wheel on the rail or in the centre of the axle?" A plain and decisive answer to the former question may be found in any mechanical dictionary or engineer's handbook, and a decisive answer to the latter question may be found nowhere. Be-

sides, it is of not the slightest importance to the practical engineman where the fulcrum is. Whether it is on the rail or in the centre of the axle, the principles of successful locomotive engine running remain the same.

I believe a question box conducted after the manner of the general principles here outlined would be a valuable feature of our Mechanical Department, and as Mr. Pray has promised his valuable aid in the matter let us get it going as soon as possible.

*Wilfred P. Borland.*

### NOT ALWAYS BAD JUDGMENT.

MR. EDITOR:—While looking over the MAGAZINES for 1892, I noticed an article over the signature of "Vulcan," in which he charges the popping off of an engine to bad judgment on the part of the fireman. I am a fireman myself on the Philadelphia division of the B. & O. R. R., where we are hauling some of the fastest trains in this country. We use coke as fuel, and the method of firing it is to have the furnace full before starting; and I will say to "Vulcan" that the coke firemen on the B. & O. would be pleased as well as instructed, if he can inform them how to prevent an engine from popping, when standing at a station with a fire-box full of coke. We have trains whose schedule time is 54 miles an hour, and we find that having the engine hot and full of water at starting is half the battle.

In regard to Mr. Knapp's definition of an eccentric, in the December MAGAZINE, he is right so far as he goes. An eccentric is a circle within a circle, but every circle within a circle could not be called an eccentric. Mr. Knapp does not complete his definition when he says that an eccentric is a circle within a circle. By defining it in that way to a person who did not know what an eccentric was, he would be no more enlightened than before. He should add more to his definition so as to make it understood that the centre of one of the circles was some distance away from the centre of the other. Combustion's definition is correct.

Sinclair's definition is, that "an eccentric is a circular plate or disc, which is secured to the axle in such a position that it will turn round on an axis which is not in the centre of the disc."

Zwicker's definition is, that "an eccentric is a subterfuge for a crank. It is something out of centre." So you can see from the above that our experts on the locomotive, in defining an eccentric, have made a provision in regard to the position of the centres, and Mr. Knapp's definition would have been just as good if he had done likewise.

BALTIMORE, MD.

*Walter C. Garaghty.*

ANSWERING MR. KNAPP'S QUESTION.

---

MR. EDITOR:—In the September, 1892, issue of the MAGAZINE Thos. P. Knapp asked, "What is an eccentric?" I did not think much of the matter more than to hope that some of his friends would, in kindness, hand him a Webster's Unabridged Dictionary, but, behold, he crops out again in the December issue. Mr. Webster states that "An eccentric is a wheel or disc having its centre outside of the common centre." Webster, our MAGAZINE and *Locomotive Engineering* are books that every fireman can obtain. When you used to help engineers you say that you "sawed wood and said nothing." Suppose you try that again until you come to something real hard, and can get no help from the above named authorities, and then we boys will try to help you out.

Your definition would better fit the axle or shaft than it would the eccentric.

HURON, S. D.

H. H. Freeman.

---

CLINKERS.

---

Keep on the right side of the head shack; he'll shovel down lots of coal if he thinks you're a nice fellow.

There are a few engineers left who are opposed to hollowing the valve-seats, but they are back numbers.

Don't go to sleep while you are taking signals; you're liable to fall out of the window and break your neck.

Keep your tools and oil cans wiped off clean; it tends to harmony of feeling between yourself and the engineer.

Don't let your engineer pick up an empty oil can; it makes him think cuss words whether he says them or not.

Don't get so interested in watching the pretty girls around stations that you can't take the signals; the engineer don't like that.

Don't sign the book for the call boy until after you get out of bed. Men have been known to get thirty days on the rocks for that.

The practice of judging of the state of your fire by the fog that rolls from the stack has gone out of date; don't cultivate the habit.

Don't guy that new brakeman because he just came in off the farm; he's liable to be general superintendent some day, and he might come back at you.

If the engineer tells you to get out and poke the sand down while the head shack is holding down the front end of your seat, tell him you ain't feeling well.

It is singular that no adequate punishment has yet been devised for the fiend who fires up engines in the round-house. The man who can fire up an engine without making a total wreck of everything in the cab has not yet been discovered.

A fireman, friend of mine, told me he had no use for a certain engineer; because he always got down to look her over whenever he pulled into a side-track to wait for a train, and after he got down he would come to the gangway and holler, "Charley, hand me down a monkey-wrench, a piece of waste, an oil can, a packing-wrench, the tank-bucket, the packing-knife, the squirt-can," and the trouble was he never wanted those things all at once, but one at a time, with intervals of about three bites of pie between each want.

I know a fireman, who is a splendid fellow, and enthusiastic to learn all he can about his business. He is stuck on a certain technical question pertaining to the operation of the air-brake, and it seems that no amount of oral explanation will make the point clear to him. I said to him: "Why don't you write out your question and send it to the Mechanical Department? I'll guarantee that somebody will make things clear to you." "Oh, no; I could never do that," said he. "Why, if the boys ever got on to it they'd guy me to death." I left him with the thought that, although he was, generally speaking, a very sensible fellow, he was in this instance remarkably foolish.

By the way, speaking about live stock, did you ever hear about that new breed of sheep that Hank Smith's father became interested in? Hank told me this himself, so I suppose it's all right. Hank's father owned a farm, way down in Vermont somewhere, and had a nice spring creek running through the back end of the place. Hank went home to visit the old gent one summer, after being away about twelve years and becoming a bold engineer in the interval. Hank walked down to the creek with the old gent one day and explained to him how, by putting a hydraulic ram at a certain point on the creek, he might supply his house, barn and stock sheds with pure, fresh water the year round. The old gent had never heard of a hydraulic ram before, but after Hank explained the thing to him, and told him about what it would cost, he decided to have one. Meeting the wise man of the neighborhood (there's always a wise man in every neighborhood) a few days after, the old gent told him how he had decided to put a hydraulic ram on the creek in that back pasture lot. "Now, see here, Smith," said the wise man, "have you ever had any experience with these hydraulic rams?" "No, I can't say that I have; but Hank told me about what one will cost, and I think it will pay for itself in less than a year." "Well, now," said the wise man, "you take my advice and don't have nothin' to do with the pesky critters; I've raised 'em and I know what I'm talkin' about. Their wool is coarse, they've got a small carcass and they are more subject to the hoof rot than any other breed you can get."

# WOMAN'S DEPARTMENT.

## CORPORAL PUNISHMENT.

The country has recently been stirred from center to circumference by the punishment inflicted upon Private Iams, during the reign of the military at Homestead, and there has been almost unanimous condemnation. It was admitted that he needed discipline for his offense, but public sentiment was opposed to the tying up by the thumbs. Efforts are frequently made to revive the whipping post for certain kinds of crime but there is a strong current of opposition to this sort of penalty. The discovery of the infliction of severe physical punishment in any of our penal or reformatory institutions, no matter what the provocation, arouses a storm of indignation. In our hospitals for the insane the old methods of physical torture, which in former times were thought necessary for the management of the patients, have been almost wholly abolished. In our public schools whipping is practically obsolete, and in most places is positively forbidden by the school board. We are outgrowing and getting away from the reign of brute strength, the domination of physical force.

The government exercised in the family is removed from the pressure of public sentiment and from any outside authority and interference. If a father or mother wishes to inflict corporal punishment on a child no one is permitted to question the right. In past generations this was the recognized mode of discipline. Children were whipped for the slightest misdemeanor, and that parent was supposed to be remiss in his duties who failed to use the rod with frequency and severity. But here, also, we see the influence of the new dispensation of justice and mercy. The principle of arbitration is recognized in the family circle. It will be noticed, as a rule, that the father who was brought up under the lash is the most sparing in its use on his own children. He remembers the intense hatred and revenge that he used to feel under the threshings of an angry parent, and he does not want his son to have such memories of him. There is many a man of mature years to-day whose heart is filled with unforgiving bitterness because of the cruel whippings he received in early life, which were out of all proportion to the offense.

A child has a keen sense of justice. He knows when he has done wrong and deserves punishment, and he knows equally well whether this punishment is given in a proper spirit by the parent and in such a degree as he merits. If he feels that it is administered in sorrow and not in anger, from a sense of duty and because the parent believes it will make him a better child, he will accept it in the right

spirit. If, however, he is beaten harder than one would beat a dog or a horse, by a parent insane from anger, he has murder in his heart toward that parent and he never entirely forgives him. I could relate many instances of this kind which have come under my own observation, although it is my blessed privilege never to remember a blow from either parent, and to have a child who can say the same. In my opinion it is never necessary to strike a child. To be obliged to do so shows that the parent is a failure. The argument is made that there are certain children who can not be governed in any other way. Perhaps this is true, but I never knew any of them. It may be that there are inherited traits of disposition that cannot be subdued in any way but by inflicting physical punishment. This simply shows that the fault lies in the parent.

Fathers and mothers lack self-control, they do not keep the whip-hand over themselves. They are irritable, high-tempered, nervous and impatient. They have not the poise and dignity which command respect. They spoil their children when young and do not teach them habits of obedience, and then, when they are older, the parents attempt by blows and harsh measures to do what should have been commenced almost at the birth of the child. Punishment is sometimes necessary, even with the best of children, but it need not take the form of whipping; they may be deprived of something they very much want, or be made to remain perfectly quiet while others are at play, or put to bed, or in many other ways be taught that if they do wrong they will have a penalty to pay. All of these things require great wisdom and self-control and perseverance on the part of parents. They must not be done one time and neglected the next. They demand a study of the child-nature and a constant watchfulness to learn which methods are successes and which are failures, so that there may be a guide for the future. As children grow older they must be taught to use their judgment and must be thoroughly drilled in the ethics of right and wrong, why some things are permissible and others are not. Especial pains should be taken also to encourage them in their efforts to do right and to reward them when they succeed. There is no responsibility in the world so great as that of rearing children, and fathers and mothers should put themselves through a rigid course of discipline in order that they may be capable and worthy of the sacred trust.

---

## IN THE FUTURE.

---

This month we clear up all the correspondence and every letter on hand is either published or its receipt editorially acknowledged. Our writers have now had two months' notice of the changes which will be made in this department. Hereafter they will be rigidly

adhered to and no exceptions made. No letter will be used which is not signed with the correct name of the writer for publication. This rule will not be broken even in the case of our most valued contributors. Those who may have sent matter before reading this can send a letter at once authorizing the use of their names if they wish them to appear. It will be held long enough for this to be done. We also wish, as far as possible, to discontinue the publication of letters and to substitute for them captioned articles. We feel that the *Magazine* has outgrown the rambling, familiar methods of letter writing, and we request our correspondents to select some one topic, write their opinions regarding it and place a suitable title over it. We are sure that our readers will approve these changes when they become accustomed to them and trust they will lend us their assistance in placing our *Magazine* at the very head of all the periodicals of this kind which are published.

---

## CURRENT COMMENT.

---

Notice is taken of women who have made a financial success in the coal business and the lumber business. There is no reason why they should not. A woman is considered perfectly competent to buy a load of coal or lay in the winter's supply for her family. Why, then, should she not turn around and sell this coal if she can do so at a profit? And, granted that she may engage in this one transaction, why may she not go into the business on a large scale? With the proper training there is no reason why women should not deal in lumber, or, in fact, engage in many occupations now monopolized by men.

---

It has been about twenty-five years since women were admitted to the University of Michigan, it being among the first of the large colleges of the country to adopt co-education. There are now more than 500 girls in the various departments, about one-third of the entire number of students. The president and the faculty are unanimous in their indorsement of the principle of co-education, and they speak from a quarter of a century's experience and observation.

---

A large number of girls' schools have classes for the study of parliamentary law, civil government and practical economy, under competent teachers. They are instructed also in the various laws in which the interests of women are especially involved, those relating to property, marriage, &c. It is advisable that women should understand these things, as, in Kentucky, for instance, and various

other states, all of her property becomes her husband's as soon as she is married, and may be taken at once to pay his debts or may be used by him in any manner he chooses, without her consent. In a number of states the wife's earnings belong to the husband and he may draw her wages and spend them as he pleases, no matter how much she may protest. In only four states do the children belong to the mother, and in New York, for example, the husband may dispose of them by will and they may be taken away from the mother forever. In some states the woman does not own the clothes she wears, but they are the property of the husband. In most of the states a married woman cannot sue a city or a corporation for an injury, such as a broken limb, but the husband brings suit for the loss of her services, and if damages are recovered he may put them in his own pocket. While women may not be able to change these statutes until they have the privilege of casting a ballot and making the laws, it is well that they should understand them and know what to expect.

---

Henry H. Faxon, a prominent citizen of Massachusetts, sends a check for \$1,000 to the Woman's Christian Temperance Union to use in the cause of temperance. He advises them not to waste time in trying to reclaim drunkards, but to devote their time and money to teaching the young the blessings of total abstinence. There are many conscientious people who will agree with him, especially those who have had experience in the work. There is small hope of reclaiming a drunkard. The number who are permanently reformed is discouragingly small. It is possible, however, to educate a public sentiment which will not tolerate drunkenness, in fact this is now being done, and great good may be accomplished by training the youth to understand the terrible physical, mental and moral effects of intemperance. The strongest efforts in this direction, however, are likely to be overcome when the boy becomes a man and finds a saloon on every corner, with all its manifold temptations, flourishing with the sanction of the law. Again the woman, who is striving against this evil, is brought face to face with the absolute necessity of having some voice in the making of the laws. Without this, progress will continue to be slow.

---

For a number of years two women have served most acceptably on the school board of New York. Their time having expired every effort was made by the various woman's organizations of that city to have them re-appointed. This Mayor Grant positively refused to do. He made no secret of the fact that this action was for political purposes. These appointments are a part of the patronage through which he and his associates hope to retain the party power, and there would be no advantage whatever in wasting these offices on women. The good of the schools which need the woman's influence is not to be considered for an instant when weighed in the balance with municipal politics.

An effort will be made at the present session of the New York legislature to amend the bill so as to postpone the time for holding the Constitutional Convention. The original bill provided for the appointment by the Governor of five delegates to represent the labor party, three to represent the Prohibitionists and three to represent the woman suffragists of the state, the rest to be elected by the districts. This bill passed the lower house but when it went to the senate the clause providing for the women delegates was struck out. Another effort will be made this winter to secure some representatives for the women of the state, who certainly are as much interested as the men in framing a constitution under which they must live. It is said Governor Flower favors their efforts.

---

About ten thousand women have registered in Boston this year in order to exercise the school suffrage. This is a gain of four thousand over last year, although many of the newspapers continue to assert that the vote is steadily decreasing. The women have had to make three long trips, one to register, one to pay the necessary tax and one to get to the polls, and then could only vote for school trustees. How many men would take all that trouble just to express their preference for a School Board?

---

## OUR CORRESPONDENTS.

---

"Blanche and Belle" write from Chilhowie, Va., of the beauty of their state, and give some opinions on "kissing" which do not vary from those heretofore expressed in this department.—"Rose D.," of Monroe, La., makes some severe remarks on wives who do not think it worth while to dress and make themselves agreeable to their husbands, and writes of Christmas two months too late.—From Van Horn, Ia., "Annie" thinks we should be careful not to discourage and depress children by thoughtless remarks.—"Alicia" sends from East Las Vegas a description of a firemen's ball given last Thanksgiving.—Mrs. Mary H., of Cleveland, Ohio, criticises those wives who speak of their husbands' faults, which should always be carefully concealed.—"A Fireman's Wife" writes from Lesbia, Tenn., in praise of the Woman's Department.—"Nelsie," of Jackson, Tenn., writes glowing words of praise for the railroad boys.—Mrs. M., of Algiers, La., remembers our department with a short note.—"Vide" sends a letter from far-off Moose Jaw, N. W. T., describing her home and complimenting the B. of L. F.—In a letter from Kansas City, Mrs. F. J. expresses warm approval of the editorial entitled, "Why Do Not Women Defend Each Other?"

L. F. M. 5 Feb 93

## THE WRONGS OF A SEX.

I think that Claudia H. Howard's "The Unvarnished Truth" is a splendid article, and when I got through reading it I felt that I would like to shake hands with him. When I read "Friar Tuck's" contribution in the September MAGAZINE my feelings were just as Claudia H. Howard's must have been, judging by what he has written. How often have I heard men say to their wives, "You must not associate with such and such women," and yet when they meet these same women they will stand and chat with them, and it don't have to be on a back street, either. Then these women censure the wives of those men for their ill treatment of them, when it is all caused by their influence. Of all the scandalous stories I have heard I can't recall one that was originated by a woman. Women certainly do a good deal of talking, but the story was first started by a man.

I have heard men say that "women once down can not be redeemed." Of course they can't when men keep them down. A certain demi monde in this city, when asked if any of her class ever thought of reforming, said: "Why, yes. But what would be the use? We could go to the ends of the earth and would be getting along nicely when along would come some man who knew us and that would be the end; not that we would be any worse than he, but the world does not think so."

I think the latter part of Pebble's "Debts and Spot Cash" is very good, for railroad men are neither better nor worse than the average man, and their wives or sweethearts need not try to make us believe it, either. No doubt the wife of T. W. H. thinks he is a perfect man, but what other woman, after reading his article in the November MAGAZINE would think so? I sum him up as an overbearing, conceited and—in his own estimation—very important man; one which the world could not possibly get along without. Now if he would take a spelling book and dictionary and go off in some quiet corner by himself, and study them thoroughly before he attempts to write again, the compositors on the MAGAZINE would have an easier time of it.

Will that "superior being," T. W. H., please inform us how he pronounces "Suater?" I suppose he meant sweeter, but must not use my own judgment, as I am only a woman.

I think "Grace Darling's" letter very interesting. I wonder if I know her? I know the wives of a good many firemen.

I have nothing to say for No. 97, for if they haven't ambition enough to write for themselves no one ought to write for them.

LOS ANGELES, CAL.

*An Engineer's Wife.*

## BE BRIEF.

When you've got a thing to say,  
Say it! Don't take half a day,  
When your tale's got little in it,  
Crowd the whole thing in a minute!  
Life is short—a fleeting vapor—  
Don't you fill an eight-page paper  
With a tale which, at a pinch,  
Could be cornered in an inch!  
Boil her down until she simmers:  
Polish her until she glimmers  
When you've got a thing to say,  
Say it! Don't take half a day.

—*Texas White Ribbon.*

## A MOTHER'S REVERIE.

How can I cease to think of thee? Somewhere  
In the great world thou art to-day.  
I cannot reach thee with my tender care,  
Thou canst not hear the loving words I say.  
Somewhere thou art and hast need of me  
To help thee up life's steep incline.  
Someway I might be of aid to thee,  
Might help thee reach contentment's hills sublime.  
Somewhere thou art, be it far or near,  
Mid scenes of mirth or sombre gray,  
My brave boy, I think of thee, where e'er  
Thou art in this great busy world to-day.

—*Nora Bull.*

## CHAT FROM PHILLIPA.

What are you all fixing for Christmas? I hope the next MAGAZINE will be replete with "ideas" for Christmas "fixings." I have come to the conclusion that a Christmas tree affords the most pleasure of anything. I had my doubts, after fixing and making everything I could—with what I had to do with—for my little ones, whether it paid me or not for the time and labor I had expended on their tree. I thought not sometime after, as they did not take the care of things I thought they should. But hearing them talking over the "awful good time we had," one of them threw herself prostrate on the floor and weeping bitterly, said, "O, mamma, the lots of nice playthings you did fix for us, and then we did get take good care of them." So I think I will again make for them what I can, for I have always averred that when people wish to do better they should have the sympathy and help of those nearest and dearest.

Now, if you have a little mechanical ability, there is no end to the nice playthings you can make. I once had a complete outfit for keeping house made for my girls, except the cook-stove, and Xmas got along before the stove was made; but I may make one this year. I love carpenter work. Then there are the rag dolls and the paper dolls. If your purse is as near empty as ours generally is, make a good rag doll with a dough face, by putting pie crust dough on the head and bake it. If you are at all artistic you can make a very good looking face—then paint it—and if a good big one, it will delight the little maiden's heart as well as any other.

For the paper dolls, cut out a pretty face from some card, make a body of card board, dress it in fancy colored tissue paper or gauze, and you will be rewarded by a genuine exclamation of delight. If I should begin to tell you of all the pretty things I have made, it would take entirely too much space, so I will say to one and all, try to make the coming Christmas the happiest of all you have ever seen.

T. W. H., of Sanford, Fla., thinks "men had better let the wimen have ther clothes for a hundreds years and the men take thier place." Just try the exchange with your wife for, say, one little week, and if, at the end of that time, you are not ready to say, "here take your old petticoats, I want my pants," we have been much mistaken in our judgment of human nature. Of all occupations there is none more trying to the nerves than that of the average housekeeper.

"Belle," of Jackson, Mich., you are fortunate in having your husband read the MAGAZINE with you. I think anything read and discussed with another, is so much more pleasant than when read alone. I often read something I think is real funny, yet I feel silly to sit and read and laugh aloud about it, and the rest not know what I am laughing at. If it happens to be anything the children can understand, I am all right. I like so much to read politics, while my husband cares nothing for it. I asked him last evening to let me read to him what Mr. Debs had to say about Reid, but he said, "O, I have been so stuffed full of Reid, this fall that I don't want to even hear tell of him again."

Mabel, put in a little more seeds of virtue, and a little more common sense, wisdom and experience, and I think your cake will be more palatable.

Yes, "See Em," we know all about the terrible wind and dust storms, and the prosy side of life in western Kansas, though it has a vein of poetry after all.

The long wished success of the MAGAZINE must have come, by the feast we have received this month. I will close by wishing that the present prosperity may continue.

GOODLAND, KAS.

Phillipa.

[Have you read the MAGAZINE all these years and not learned that articles do not appear for two months after they are written? Your Christmas suggestions are good and we use them, although late. You will have to sign your name hereafter.—Ed.]

FEBRUARY, 1893.

## PROMOTION OF FIREMEN AND HIRING ENGINEERS.

The MAGAZINE is not required to devote space in stating that the promotion of firemen and the hiring of engineers is a proposition fruitful of vexatious controversies on all the railroads of the country, particularly those where the membership of the two great orders work under contracts with the railroad officials.

It has been the ambition of the MAGAZINE under its present editorial management to secure harmonious relations between the two brotherhoods, the B. of L. E. and the B. of L. F., upon all matters touching mutual interests. Nor have we been deflected from our purpose by the frequent exhibitions of obtuseness on the part of those who were elected to fill high positions, because it was believed they were capable of comprehending special needs of those who placed confidence in their ability to see and advocate the right. And notwithstanding the bigotry and stupidity of officials who demonstrated their total unfitness to discuss any question in a broad and liberal spirit, notwithstanding their doltish jealousy and pigish policy, this MAGAZINE, animated by higher motives, has sought ceaselessly to bring about amicable relations between the membership of the two great brotherhoods.

The question now to be discussed is probably as delicate as any one that could be suggested, and if our views in the matter should be adopted and acted upon by the members of the B. of L. F. would be required to make all of the concessions and sacrifices, nothing of the kind being required of the B. of L. E.

There must be in this connection the  *frankest* and the clearest statements possible regarding the situation. No sophisms, no begging the question, no circumlocution nor jugglery of words can be tolerated. If firemen are to make concessions and sacrifices for the benefit of engineers they have a right to demand and to clearly understand the reason why.

It so happens that there are, say, 4,000 engineers in the country who are idle and want employment in their chosen calling. We do not know that there are that number, nor have we any authentic information as to how many engineers are out of employment. We say 4,000—any other number would answer our purpose quite as well—but there are a large number of engineers seeking employment as engineers. These engineers, in the main, have been promoted from the ranks of firemen. Whether or not they have forgotten the fact need not here be conjectured. They were once firemen. They were promoted. They are now engineers. There is, as a general proposition, no more promotion for them. They are idle and want employment. We state the fact squarely. We know whereof we write.

How stands the case with the firemen? They are firing locomotives, learning the business at about half the pay engineers obtain, and this they are doing to *secure* promotion. Their ambition is not only natural but eminently laudable. They look out for themselves. They are, like engineers, engaged in the battle of life. They work and wait, often requiring many years to secure the coveted prize. These firemen, on numerous roads where they have contracts or schedules, stipulate that when an engineer is wanted that a fireman shall be promoted and not hired from the ranks of idle engineers. They are looking out for themselves, and we ask, what is more rational or logical? On the face of the policy it has the appearance of human wisdom. It is not intrigue. There is nothing in it bearing the impress of plot or stratagem. It is simply, and as they believe, wisely looking out for their own interests in an entirely legitimate way. We do not believe that in the nature of things the action of firemen as we have pointed it out relating to promotion and against hiring engineers, can be successfully combatted. If, therefore, the policy of the firemen is objectionable, the reason for it must be sought for elsewhere—in ultimate outcomes. Let us dispassionately discuss this phase of the subject.

For firemen to insist upon the demand that when a railroad needs engineers it should promote firemen, as we have said, is natural and logical. Seemingly it combines right and reason in an alliance in the highest degree commendable, and if objectionable, if it ultimates against the interests of

firemen the fact should be so lucidly pointed out as to command attention.

We have said there are now 4,000 idle engineers seeking employment. It is not required to say why they are idle. These men, in seeking for work, are met by contracts between railroad officials and firemen stipulating that when an engineer is wanted a fireman *must be promoted and not hired from the ranks of idle engineers.*

It is, as we have said, a case in which firemen are looking out for their own interests, and it is just here that the question arises, is this the wisest policy for firemen to pursue?

The constant promotion of firemen to the ranks of engineers is one of the reasons why there are so many idle engineers, why the supply of engineers is greater than the demand, a fact which a moment's cool reflection will serve to show firemen is in conflict with their interests.

Take a case. We like to reason from *units* because the facts apply to *tens* and *hundreds*. A. serves, we will say, five years as a fireman, and is promoted to be an engineer. He has reached the coveted goal and his ambition is satisfied. He serves at the throttle for one year and then, for some cause, loses his place. He then enters the ranks of the idle engineers, he swells their number, making employment more and ever more doubtful. At this juncture A. tries to secure employment as an engineer. He served five years as a fireman and one year as an engineer, but is met by the firemen's policy, which as a fireman he advocated, that "when an engineer is wanted a fireman is promoted." Necessarily A.'s fate is fixed. He can not be hired as an engineer. What is left for him? This. He can again enter the ranks of firemen, work another five years with pick and scoop and take his chances for promotion and another discharge. This theory, it is seen, works in a circle. It is round and round in the same treadmill of work, promotion, discharge, and the resumption of places at the bottom to work up again to the top.

In this, we ask, if it does not appear that a wiser policy could be inaugurated so that a fireman, once promoted, may feel an assurance that in case of losing his place, he shall not be required to serve another five years at firing to become an engineer?

The whole argument centers, finally, in the proposition we have submitted. And here the question of compromise arises, and let it be said, if mere selfishness is to prevail, the compromise is specifically in the interest of the firemen in its ultimate results, since, taking the case of A. in our illustrations, if the policy could be introduced of hiring engineers under certain stipulations, he might be reinstated to the throttle without being required to serve another apprenticeship as a fireman.

This brings us to the consideration of the compromise suggested. What should be its nature and scope? It presents to our mind no very great difficulty.

Take any railroad, or system, where firemen have a contract, that, when an engineer is wanted, a fireman shall be promoted, and modify it to the extent, that when an engineer is wanted on the road, promotion and hiring shall be reciprocal—first, the promotion of a fireman; second, the hiring of an engineer. By this arrangement two exceedingly valuable results are secured—first, the reduction of the number of idle engineers; and second, the large probability of enabling a man, once an engineer, to secure employment without being remanded by circumstances, to again go through the drudgery of an apprenticeship as a fireman.

On the part of the firemen, it is the surrender of the right of immediate promotion, that they may grasp more firmly the position of engineer, when they are promoted. It is a case of ultimate security of position, as against prompt promotion with the chances of being found in the ranks of idle engineers, with scarcely a chance to secure employment as engineers.

It is a fact that should be stated, that as a general proposition, railroad officials are favorably inclined to multiply the number of idle engineers, as they find them exceedingly handy in case of trouble, when they can be utilized by taking the places of men who seek to obtain and maintain their rights against aggression and oppression, which too often has been a feature of railroad employment.

As we have said, there are a large number of engineers and firemen throughout the country, members of their respective orders, out of employment. The question arises, how can assistance best be rendered to these men by their orders?

We suggest that the Brotherhood of Locomotive Engineers and the Brotherhood of Locomotive Firemen, each, at their grand lodge headquarters, establish what may be termed a Registering Bureau, for the purpose of recording the names of all members who are out of employment. This could easily be accomplished by requiring every lodge of the respective orders to send forward the names and addresses of such idle men.

In this connection it should further be required of the various lodges to notify the grand lodges when there are opportunities for employment—the promotion of firemen or the hiring of engineers—and upon such information, prompt action could be taken by the grand lodges of the respective orders to promptly meet the demand and fill the vacancy or meet such requirements as the emergency demanded.

Manifestly, some arrangement should be made to solve one of the most difficult prob-

lems that now confronts firemen and engineers, in matters we have pointed out, and as the subject challenges discussion, it will be well for the thinkers in the ranks of engineers and firemen to give it their consideration. The course we have suggested is in the line of concession and compromise on the part of firemen, looking to the ultimate and permanent good of all concerned. It is in the line of fraternity and good will, which we believe would result beneficially in many ways to all concerned.

### SOUVENIR PROGRAMMES AND THE FRAUDS PERPETRATED UNDER COVER OF THEM.

We have in previous issues of the MAGAZINE alluded to the "Souvenir Program Fraud," but it seems that the discreditable business is not yet entirely stamped out, and that in various localities certain conscienceless scamps are able to use the name of the brotherhood in pursuing their praxies.

That the readers of the MAGAZINE may be put in possession of all the facts in this disreputable business, we insert here the letter of W. N. Gates, Esq., sole agent of the advertising department of the MAGAZINE:

*Firemen's Magazine, Eugene F. Debs, Esq., Manager and Editor:*

"DEAR SIR:—I write to call your attention again to the queries as well as complaints I am again receiving from advertisers and friends of the brotherhood, as regards the most urgent demands made upon them for account of advertising in a said "Souvenir Programme," to published for the Cincinnati Annual Convention, and alleged to be in the sole interest of your brotherhood, to help "defray expenses," &c. I suppose it is needless to ask if it does, for of all the "souvenir programmes" gotten out in the interest of the railroad brotherhoods during my connection with them for twelve years past, I have never yet found that the brotherhoods got anything out of them but *condemnation*. In my travels over the country, in soliciting advertising, I am constantly met with the rebuttal argument, that the advertiser cannot afford to do anything for the FIREMEN'S MAGAZINE, as they have spent so much money taking ads. in "Souvenirs," "Local Lodge Programmes," or "Ball Tickets." I have constantly correspondence thrust at me soliciting the ad., &c., for the benefit of a "Convention," "Union Meeting, or "Ball Expenses," or for some "Sick Fund." So great and general have these solicitations become that I find now among the victims of these schemes, strong prejudice growing against the brotherhoods, some advertisers calling the members a "lot of mendicants," &c., that cannot save money enough to defray the legitimate expenses of their conventions and ask them to patronize something that has *no merit*, but *do, only in the light of a "contribution."* You will remember the Baldwin Locomotive Works gave us their card only on the condition that the grand officers would furnish them a letter that they did not endorse these schemes; so great had become their importunities and drains upon them, that Mr. Converse, of the company, told me he would gladly double the advertisement could he rid himself of this annoyance. He had ordered some of these solicitors out of his office recently, because they had threatened to prejudice the "boys" against their trade if they did not patronize their programme. I could cite many similar cases, and can furnish an unlimited amount of this testimony, if you desired the same, from those who have been persecuted, and say they will *not patronize the official organ* until this nuisance has been abated. Its friends will, of course,

say I speak adversely because it hurts my advertising. I admit this, without qualification, but as I get my pay for the services rendered only out of *contracts obtained*, it is plain to see it is to our mutual advantage to remove that which takes support from the MAGAZINE. I could make a far better showing and the MAGAZINE's revenue would be largely augmented were it not for the great opposition and prejudice engendered by these outside schemes purporting to come from the brotherhood. I have found, in some cases, many unscrupulous advertising solicitors have leased the "right" to these publications from the entertainment committee, and empowered with letters of authority from said committee, have resorted to every argument and even attempted coercion to get this advertising. Undoubtedly the committee did not know, and never has known, how the good name of the brotherhood has oftentimes been besmirched by these unscrupulous solicitors, that carry their office in their hats, and have nothing at stake but *profit*, yet are *ouched for* by the brotherhood. I can go into details upon any point you may raise, but in the meantime trust you will take pains to investigate this matter before the substantial friends and sympathizers of your brotherhood have been turned against you for reasons of such gross imposition.

Yours very truly,

W. N. GATES, Manager Advertising.

The foregoing letter points out how the "Souvenir Program" swindle creates distrust in the minds of honest men, who are disposed to avail themselves of the pages of the MAGAZINE for legitimate advertising, and how imperative is the demand upon the Brotherhood to do whatever lies in its power to put an end to the rascality practiced in the name of the order.

The Grand Secretary and Treasurer in his report to the Cincinnati convention, gave the delegates to that convention, the required information to enable them to comprehend the rascality of the "Souvenir Program" business. He said:

"Two years ago, on the occasion of our San Francisco convention, the contract for supplying the "Souvenir Program" was awarded by the local committee to a New York shark, who, representing himself as the authorized agent of the brotherhood, extorted thousands of dollars from railroad companies, supply firms, manufacturers and all classes of business men, they having the impression that they were contributing to the support of the order, in consideration of which the scoundrel agreed to insert their advertisement in the "Official Souvenir Program," which it was falsely alleged was to have a fabulous circulation. What was the outcome of the scandalous scheme? The program, so far as the grand lodge has any definite knowledge, was not even printed, or if it was printed, not a copy of it could be procured by the grand officers, and only a sufficient number were printed to supply each advertiser with one copy so as to enable the pirate to make his collection. Of course the outrageous proceeding leaked out and the chagrin, disgust and indignation of the fleeced subscribers may be imagined. Scores of indignant complaints and protests were received by the grand lodge, and it was months before the scandal could be explained away and it is doubtful if even at this late day the stigma has been entirely removed from the good name of the brotherhood.

When the B. of L. E. held their convention at Pittsburg recently they had, I am reliably informed, a similar "Souvenir Program" experience. The sum of \$10,000 was collected in the same manner, which amount was as certainly stolen from the subscribers as if they had been held up on the highway at the point of a pistol.

At almost every union meeting the "Souvenir Program" racket is worked to prey upon manufacturers and merchants. In a thousand different forms is this blackmailing, as I unhesitatingly pro-

nounce it, carried forward by designing persons, for the most part representing themselves as the authorized agents of organized labor.

If the proprietors and managers of these enterprises are disposed to advertise in the MAGAZINE, as many of them are, the revenue goes into the general fund of the order and all members are benefited thereby. We give value received in publishing a superior MAGAZINE which has a continental circulation. The transaction is fair to both parties. There is no element of fraud or beggary about it. The dignity of the order is in no way compromised. On the other hand, the "Program" sharks appropriate all the money to their own use, and as a rule to which there are but few exceptions, swindle their patrons and fasten the stigma of the outrage upon the brotherhood. Shame on such scandalous outrages, and let us put a stop to them once and forever by passing a measure prohibiting absolutely any committee or other person from using the name of the Brotherhood directly or indirectly in any transaction whatever involving the collection of money for advertising purposes, except such as are provided by the laws of the organization.

Unless this is done all reputable advertisers will withdraw their patronage from the MAGAZINE and the fair name of the brotherhood will be smirched with fraud and imposition.

So far as I am personally concerned, I confess to a feeling of abhorrence for every species of mendicancy and beggary on the part of organized workmen, whether it be by the forced sale of ball tickets, excursion tickets, tickets for raffles or for any purpose whatsoever. I think a certain degree of humiliation as well as vulgar audacity attaches to an organization that practices such impositions. Let us stop passing the hat. Let us put our hats on our heads and keep them there and not doff them except in the presence of men who doff their hats to us. We are not beggars and we are not paupers, nor are we to be considered a charge upon the community. If we must beg alms let us change our title and be known as a brotherhood of beggars.

I am impelled to call your attention to another matter of abuse, which, in my opinion, cries loudly for correction. Lodges in cities in which our conventions are held, from motives of pride in the order, desirous of eclipsing all previous conventions in point of display, require large sums of money to meet the extravagant arrangements. To raise this money every conceivable form of beggary and extortion has been practiced. What has been the result? Innumerable bills that could not be paid, bankrupt lodges, and an interminable row between the lodges and committees, as to the proportion of the deficiency each should pay. Let us have done with such sham and such nonsense. The cheap effects of extravagant display do the order no good. Locomotive firemen are not rich. A convention is not a dress parade for dukes and duchesses to display their feathers. A convention of labor representatives ought, in my opinion, to be stripped of all gewgaws, all pomp and all extravagant ceremony. A labor convention from first to last is, or should be, a business convention, and conducted upon rigid business principles. When the gavel sounds the final adjournment, relief and rest and pleasure may be had to the heart's content. Let no expense be incurred except for business purposes.

It is my earnest hope that these matters may receive your earnest consideration and that such action may be taken as will correct the abuses I have briefly outlined.

The "souvenir program" business, in so far as we are advised, is in every instance, more or less a fake without a redeeming feature. It is conceived in fraud—there is never a purpose to deal fairly with advertisers, and by using the name of the brotherhood, it becomes conspicuously identified with the contemplated scoundrellism. Nor is this all, the "souvenir programme" in every instance, places the brotherhood be-

fore the community as a mendicant, a vulgar beggar, an Oliver Twist, everywhere extending its hand for contributions, that it may live. If it were true that the brotherhood is thus unable to exist without playing the part of Italian lazzaroni, then it ought to disband, but it is not true, and therefore the souvenir programme mendicancy is a shameful stigma upon the good name and fair name of the order. It has got to such a pass at last, that lodges of the order, in numerous instances when they want to have a ball, the "souvenir programme" fraud is trotted out for the purpose of bleeding business men. As we write we have on our table one of these ball "souvenir programme" propositions, asking for advertisements, at \$50.00, \$25.00 and \$15.00 per page, half page and quarter page, stipulating that a circulation of 5,000 copies will be printed—as also an advertising blank contract. The swindle is reduced to a regular system, and is practiced with the intent to rob those who are caught by the trick.

Advertisers, in numerous instances, in various ways, by adroit manipulation of the "souvenir programme" cheat, are able to use the lodge for their own profit, but in every instance the reputation of the brotherhood for fair and honorable dealing, suffers and often most grievously.

What is wanted, and imperatively demanded is to effectually stamp out the "souvenir programme" fraud, and as soon as possible, let honest business men know, that the Brotherhood of Locomotive Firemen repudiates the whole business, and this MAGAZINE will in future do all that lies in its power to expose such base frauds. And we call upon the lodges to aid us in this important work of rescuing the character of the brotherhood from the foul blot which has been placed upon its escutcheon.

---

MESSRS. SINCLAIR & HILL have gotten up, without regard to expense, a calendar for 1893. It is highly embellished, and on the second page gives a wheel outline of "the different breeds" of locomotives, as follows: 8 wheeler, Mogul; 10 wheeler, Consolidation; 12 wheeler, Decapods and Forney, and as the months go by, the eye is tickled with other pictures of many things beautiful and true and good, to say nothing of the fact that the days of the week and month are arranged for easy reference, so that when a fireman asks, "where am I at?" the calendar will tell his latitude and longitude to a dot. This artistic calendar has been placed in easy reach of every fireman, who can get it by sending for it to Messrs. Sinclair & Hill, No. 5 Beekman street, New York. Our advice is, send and get one. It will be found a pleasant companion in the cab, round house and parlor, and is warranted to keep 12 months.

Messrs. Angus Sinclair and John A. Hill, in running *Locomotive Engineering*, mean business with a big B, and the January issue of the great publication, to use a phrase for all it means, is a DANDY. The MAGAZINE cannot do better than to let Messrs. Sinclair & Hill be heard upon the subject through its columns. Referring to "our birthday" they say:

Five years ago this month the first *Locomotive Engineering*, *nee Locomotive Engineer*, was issued. It was a little 16-page, 3-column infant, but it yelled lustily, and—most important of all—lived.

Its editorial policy was unlike most other papers in the field, and its aim was more to interest and instruct the rank and file in the railway motive-power and rolling-stock departments than to cater entirely to those high on the ladder.

This policy has done enough good to make the paper the favorite one among progressive railroad men high and low, has increased the page to 4 columns, the number of pages from 16 to 48, and the monthly mail-bag from a few hundred pounds to more than five tons.

As we do not blow our own horn in the reading pages but this once a year, we may be excused for having our little New Year's say and feeling good because there are plums in our birthday cake and peanut candy on the frosting.

Last year the great enlargement of the journal and the doubling of the subscription price was going to ruin the paper—so we were told.

But the *Locomotive Engineering* nurses had experience, and felt assured that the railroad men of this country would not drop a good paper because it had been made twice as good—and charged for accordingly.

This year the report of our old club-raisers from far and near are that they will increase their lists, and from every part of the country come applications for permission to get subscribers—the circulation is assured.

Advertisers know a good thing when they see it, and the doctrine that a big circulation is a bad thing for advertisers is not making converts to any alarming extent.

During the year we have spent a great deal of time and money to make the paper interesting and instructive, and for the next year propose to fill its pages with such matter as will confirm and, well, sort of "rub in" the words on the seal of public approval—"Most Interesting Railway Paper Published."

*Locomotive Engineering* starts out on her sixth year with new head, new dress, new ideas and new courage. She sends a greeting to one and all, old friends and new, and wishes them a Happy New Year.

The January *Locomotive Engineering* is a book of 48 pages 15½x10½, and from cover to cover, or from "start to finish," is something in the nature of an encyclopedia—and its twelve numbers for 1893, bound, would make a volume of vast value to firemen and engineers particularly, as also to any employee engaged in railroad train service.

We have taken occasion frequently to call the attention of our readers to the excellencies of *Locomotive Engineering*, and have staked our judgment on the declaration that every fireman in the great brotherhood should be a subscriber for his own special benefit. In what we have said of its sterling qualities, we were far within the boundaries of its merits, and we can therefore repeat our admiration and appeal to firemen to subscribe for it, in the full assurance by so doing they will feel obliged to the MAGAZINE

for the wisdom and prudence of its unqualified indorsement.

Graham's Reporter's List, Andrew J. Graham, 744 Broadway, New York, is one of the standard photographic series of books, published by one of the oldest of living practical shorthand reporters, who has for nearly forty years given the benefits of his perception and analysis of this beautiful art to the young and old who are now or have been learners or practitioners of the science of shorthand, whether for pleasure or profit. This book deals with the advanced style of the "Corresponding Style" to some extent, but leads up to the "Reporting Style" in its most beautiful and clearly read brevity of sign words, for in standard phonography brevity is the conspicuous trait, and it is hard to say which should have the precedence, brevity or certainty of reading.

This book is the result of fourteen years of patient effort in placing in the clearest possible way for reference all the possible words from the same root or stem, and position is in all cases made the standard, and the words in the Reporter's List are in all cases closely related in all respects to the works that precede this one as well as the dictionary, which is the "granddaddy" of the series, and if a student has in a desultory way taken up one of Graham's books and commenced anywhere, he or she will be led on and upwards, systematically in a forward direction, instead of turning and twisting through "changes," "improvements" and a maze of unsettled problems. Graham is concise, uses analogy in his work and reasoning, is carefully explicit and tells why ~~not~~ to do a thing, and the reason why, as well as to do it, and why!

This book is 12 mo., cloth, pp. xlii., pp. 1000, filled with the phrases, word signs, and contractions, all grouped under the stem sign, beautifully engraved, and with a pure margin around each page, then follows 107 pp. notes on the 1000 pages, and an index from which any word or set of signs or phrases can be had at a glance. There are other books to which and from which all references are made or had to and from this. The Standard Phonograph Dictionary is the largest and final resort. There are several Readers and a Hand Book, all of which are, to use a mechanical expression, "interchangeable," and reference either way is clearly put, all agreeing with each other. There is a system in all its completeness, and it seems to be a book that any student or advanced reporter should have to refer to to perfect their study of the art. Price not given. Address author and publisher, Andrew J. Graham, 744 Broadway, New York.

No. 1 VOL. I, of *Link and Pin*, published at Denison, Texas, under the editorial management of H. F. Miller, is on our table. In his salutatory, editor Miller says:

The paper is designed for and published in the interests of union workingmen, leaning, particularly, as its name indicates, to the side of the railway employee; but it is also the willing champion of all honest, union workingmen of whatever vocation, for, being union men ourselves, it stands as a matter of course that the union man is our friend. We consider it a duty, and one that we will faithfully endeavor to perform, to encourage all non-union workmen (those who have never been members of or experienced the benefits to be derived from labor unions) to become one of us, that we may extend to him the right hand of fellowship, and brotherly love.

The foregoing has the right ring. There is still room for link and pin, pick and scoop, punch, throttle, switch and brake literature, and we welcome the *Link and Pin*, as a comrade, to do battle for the great army of toilers and wish it the most gratifying success.

## THE DEATH OF THE NOMS DE PLUME.

The Lord have mercy on their souls!  
 The last of life they've seen,  
 They scorched us off like burning coals  
 Here in the MAGAZINE;  
 The masks are off them now, thank heaven,  
 And right before our gaze,  
 We'll view the crowds with whom we've striven  
 Concealed in other days.

The breastworks which have hid them long  
 Have all been knocked as flat  
 As Paddy Murphy's random tongue,  
 Or my last summer's hat;  
 And right before observing eyes  
 They now must take their stand,  
 Bereft of garments of disguise,  
 Unmasked on every hand.

I wonder how they'll all appear?  
 Say, "Switch," you needn't mind,  
 You've writ some choice productions here,  
 The mask you'll drop resigned;  
 And "Friar Tuck" must doff his cowl  
 Before our steadfast gaze,  
 The "Friar" dearly loved to growl  
 Concealed in by gone days.

Come, "Slashbar," "Hook" and "Scoop" and such,  
 And "Tallow Pot" and more,  
 Whose necks we'd dearly love to clutch  
 Full many a time of yore,  
 We'll welcome you bereft of masks  
 Before us for review,  
 Because we've had some tough old tasks  
 In windmill wars with you.

The ladies—bless their darling hearts—  
 They'll also have a chance  
 To drop their masquerading parts  
 Until we'll get a glance  
 Of who they are, and what they are,  
 And how they stand their ground,  
 If rivals do their faces mar  
 In many a future round.

If Shandy still survives, you know,  
 It gives him no disguise,  
 He's often stood full many a blow,  
 Right straight between the eyes,  
 From hidden foes, who fiercely struck  
 With hot, malicious spleen;  
 Hereafter we'll all observe their pluck  
 Here in the MAGAZINE.

*Shandy Maguire.*

## CLASS ORGANIZATIONS.

MR. EDITOR:—Four months having intervened since the close of the Cincinnati convention, time and distance having obliterated feelings which events therein occurring had given rise to, and I can now look back with calm, unruffled temper and view these incidents with the eye of calm impartiality.

There was a narrow class, or craft, prejudice, like a strong undercurrent, running through the thoughts of a very large number of delegates, which came to the surface on two or three occasions and almost mustered strength enough to control the convention and dominate the future policy of the order. It was that firemen alone should hold office and rule over firemen, and that none but firemen should be given positions of trust or emolument within the brotherhood. As it was the first time I had encountered this sentiment I felt somewhat nettled, and considered it bigoted, brutal and ungrateful. "What!" thought I, "are

the men who helped build up this grand brotherhood, stood by its cradle, shaped its thought, and guided its tottering footsteps along the pathway of wisdom and prudence to stability and prosperity, who made it possible to have a living brotherhood for these callow youths to become members of, are these old pioneers who have clung to the order through all these years, endured persecution, ostracism, abuse and misrepresentation for its sake, to be now thrust aside and told that they are no longer wanted, because they have advanced beyond the positions of firemen?" And I felt sore, sad and resentful. But is not this sentiment logical in a class union? Is it not consistent? I now believe that it is, and with the dawn of that belief my sadness and resentfulness have vanished like mists before the morning sun. If we are to have class organizations representing the different branches of railway service, let us have them strictly class. It is but just that an organization, claiming to protect and promote the interests of firemen, to govern their relations to their employers, regulate their wages and conditions of service, specify methods of promotion and qualifications necessary thereto, should be composed of firemen, and governed by firemen for firemen. In a strictly class organization, it appears to me, to be out of place for any others than those actually engaged in the calling represented, to belong thereto, or have a voice or vote in its management. Engineers, conductors, brakemen, switchmen, machinists, printers, clerks, business men, etc., should not be permitted to legislate for firemen. Firemen or others should not legislate for engineers, conductors for brakemen, nor brakemen for conductors.

As each branch of the service has an organization of its own for the express purpose of looking after its own peculiar interests, it should be free from intermeddling by men in other branches of the service and left to "mind its own business."

Class organizations, from the very nature of their composition, are necessarily narrow and selfish. They are but a short step in advance of the old individualistic idea, where each person was free to rustle for himself, and the devil take his neighbor. Instead of a single person, we have a combination of persons banded together to get the best of everything for themselves in their particular line of service, regardless of the effect such action may have on their neighbors. Two of these organizations may advance along parallel lines to a definite point without friction. At that point their lines converge and their interests clash; here the old spirit of selfishness that ruled the individual comes in to rule the union, and each tries to get the best of the other. Instead of individual selfishness, we have

organized selfishness, and justice and reason weep at the spectacle presented.

Is it necessary to cite instances and illustrate this idea? Kind reader, study the relations existing between the Brotherhood of Engineers and the Brotherhood of Firemen, or between the brakemen and the conductors. Take an instance where one of the brotherhoods is forced into a conflict with a corporation, and note the position assumed by the others. It will remind you somewhat of the philosophy of the Nevada gambler, who said "he didn't give a damn what happened so long as it didn't happen to him."

The engineer, realizing that there are a surplus of engineers in the country, and that the surplus is being daily augmented with an alarming rapidity that threatens the permanency of his position and the standard of wages, is frantically endeavoring to stop promotions. The fireman, young, intelligent, pushing, energetic and ambitious, anxious to advance and escape the meagre pay and wearying toll of his occupation, cares nothing for the engineer he is to crowd off at the top, and sees in the opposition to his promotion but a blinded prejudice, or spiteful desire to check his laudable aspirations.

The brakeman, wholly oblivious of the man who has grown gray in the service, and through years of hard work has, by bitter experience, qualified himself to fill the position of conductor, goes ahead and makes a contract with his company that all conductors must be promoted from brakemen, promotions to be governed by strict seniority.

While we are thus industriously engaged in cutting each others throats, our friends, the enemy, are actively encouraging us to continue on the same lines. Chauncey M. Depew tells the engineers they are the *creme de la creme* of the working people, while his hand is on the throat of the switchmen, and the poor fools hug the flattering unctious to their souls that he is sincere and they are really made of finer clay. Perkins, of the "Q," persuaded the conductors that the engineers were getting part of their pay, and that the conductor was an official to whom the engineer, the rascal, should be subordinate, and the conductors prove "loyal" to the company.

The brakemen on the Northwestern are purchased and cajoled by a corrupt cabal of grand officers, to supplant the switchmen, and are "sustained" by their order. Czar McLeod allows his slaves to pick up a few crumbs on his system, and P. M. Arthur rushes into print to proclaim him a benefactor and a friend of labor.

While all this is going on, the lynx-eyed agents of the great corporations are scouring the marts of Europe, and gathering together hordes of ignorant immigrants and

shipping them to this country to glut the labor market and minimize the work of the trade union.

Politics are tabooed in our class lodge rooms, and the great majority remain in utter ignorance of the far reaching influence of the legislation that is being enacted by the paid attorneys of the corporations, whom their votes have elected to office.

What is to be the end of all this, and how are we to improve on our present methods of organization?

By federation? Federation would certainly be a vast improvement, and, no doubt, accomplish great good. Still, I do not consider it capable of rendering the stable, harmonious and beneficial results which one general organization of railway employes would secure for us. I believe, as long as class organizations are conducted as at present, federating them would only prolong the deplorable conditions to which they have given birth.

In the labor world we are governed by the same general law that influences progress along all lines of development, viz: the law of evolution. The individual has had his day, and a hard and bitter one it was, too. Next the class unions. These no longer meeting all the requirements of changing conditions, must give way to a better system in consonance with the expanding desires and liberal ideas of the new day. What that system shall be, the future alone must determine.

T. P. O'Rourke.

POCATELLO, IDAHO, December, 1892.

In the list of dealers who purchased goods from the Rochester Combine, recently published in the MAGAZINE, appeared the name of Mr. Isaac Wolff, of Chicago. We are now informed by Mr. James Hughes, of the Garment Fitters' Association, that Mr. Wolff, upon being informed of the trouble between the Combine and their employes, immediately withdrew his patronage from that quarter and gave assurance of his sympathy with the employes, declaring that he would purchase no goods from any firm or company that was not on friendly terms with its employes. In this Mr. Wolff has taken a manly stand, and it is only right that he should have the benefit of this statement, to the end that he may enjoy his share of the patronage of organized workmen.

We are in receipt of a pamphlet from The Westinghouse Air Brake Co., Pittsburg, Pa., giving full descriptions of the improved air brake apparatus, manufactured by that company, and containing numerous drawings of the brake, which must be of great service to engineers and firemen, since the instructions for handling the brake, aided by the diagrams, vastly simplifies the management of the appliance.

## FIREMEN'S RIGHTS.

MR. EDITOR:—I wish to say a few words in reply to one who signs himself "Main Track" in the December MAGAZINE. His language sounds very strange to me. He says, in the first place, that "a fireman has no rights, but has to take just what the engineers see proper to bestow."

Now, he may not mean this, or he may be talking just to see how it will look in print. Firemen do have rights, just as well as the engineers have. We want an honest day's pay for an honest day's work. Are engineers not working for their bread and butter the same as we are? When any person makes the assertion that we have no rights, I, as a fireman, take it as an insult. In the second place, he says "firemen depend too much upon engineers, and vastly too little upon themselves." Now, I have spent a number of years as a fireman, among firemen, and I do not know of an instance where a fireman depends upon an engineer. We always depend on ourselves; we do our own work and let the engineers do theirs; and this, I think, is the proper way to get along. I think we are just as independent as they are. If they can get along without us, we can surely get along without them.

In the third place, he says he thinks it strange (so should I) that the B. L. F. should ask the engineers for protection. He does not say firemen this time, but the B. L. F. Again I am at a loss to find a case where we ever asked the engineers to help us, either individually or otherwise. I agree with him that if we wait for engineers to help us we will be a long time without help. Then he goes on to tell us how an engineer will help a brother engineer before he will help a fireman, and says it is right; and I answer yes, providing the fireman is not a brother of his, in which case he should treat both of them alike. He compares this with how firemen help strange brothers who come among them looking for employment, saying that firemen will keep out of the way of strange brothers instead of trying to find work for them. Now, in this matter, I am sure that he also misrepresents the firemen. Firemen do not generally come here looking for employment, still we occasionally fall in with a few who have wandered this way, and I know that we always make it our business to find any strange brother who may be in our town, and we are always glad to meet them and do for them everything that is in our power. The next point he touches upon is one in which we have had a bitter experience; that is in regard to engineers acting on our protective boards. From the manner in which he writes I should judge he was on the opposite side of the engine from us. He is not in favor of engineers acting on our protective boards, and gives as his reasons that they do not act as firemen would, but look out for their own interests

and not ours. He seems to have very little faith in engineers who belong to our order; in fact, he seems to have little faith in all hands. We have engineers in our order, and if we are of the opinion that they will make good officers on our protective boards, and are willing to trust our interests to them, I say by all means elect them. But do not place firemen on your protective boards just because the engineers have a cast-iron rule that they will not work with you if you have engineers acting on your boards. Let us suit ourselves, and never mind anybody else. Lastly he speaks of federation and says the engineers want it. Now, that is the first time I ever heard that the engineers wanted federation. He says they want it because they could then do just as they pleased with the firemen. Here he puts us down as being very weak. Give us federation and we will show them that we can hold our end up with the best of them. I feel confident that "Main Track" is not a member of our valuable order.

George W. Speer.

MONCTON, N. B.

THE December issue of the *Carmen's Journal* comes to us in new form, new dress, and in all regards, one of the best gotten up publications of organized labor, reflecting the highest credit upon the order whose efficient organ it is. We notice that the brotherhood now has 145 lodges, and is marching on to still greater success. Bro. S. Kelihier in his reference to the *Journal* says:

It is not without some feelings of gratification and pride that your editor again calls your attention to our official organ. Less than two years ago our lodges voted in favor of publishing a journal and a small sized eight page paper was decided upon, the first issue of which appeared in April, 1891, when our order had only thirty-two lodges with a membership of less than twelve hundred, while this issue represents one hundred and forty-five lodges with a proportionate increase in membership. That our journal is responsible for our phenomenal success must be realized by all who are familiar with our record. One hundred and thirteen new lodges organized with a corresponding number of members added in twenty months, is indeed a record to be proud of, and to the *Carmen's Journal* belongs the greater credit for what has been accomplished, for it has not only built up our brotherhood but has made its presence, objects and progress known to the world. It has brought the importance and responsibility of our craft to the notice of our railroad officials and the general public, and given the members of that craft an understanding of its condition throughout the country, as well as furnished them with other information of vital importance to them and their fellowmen.

Manifestly, the influence of a well conducted organ of a labor organization, cannot well be over-estimated; they are educators of immense value, holding the membership in line compact and advancing.

We congratulate the Brotherhood of Railway Carmen, assuring the membership that the MAGAZINE takes special pleasure in chronicling its success. Like Tennyson's brook, may it go on forever.

# GRAND LODGE.

## ASSESSMENT NOTICE FOR FEBRUARY.

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., FEBRUARY 1, 1893. }  
ASSESSMENT NO. 85, \$2.00.

### To Receivers of Subordinate Lodges:

**SIRS AND BROTHERS:**—You are hereby notified of the death and disability of the following members entitled to all the benefits of the order, viz:

**CLAIM NO. 898.** Chas. B. O'Donnell, of Mayflower Lodge, No. 415, was declared totally disabled by Loss of Hand, August 28, 1892.

**CLAIM NO. 894.** H. O. Draper, of White Breast Lodge, No. 278, died of Tuberculosis, November 1, 1892.

**CLAIM NO. 896.** Wm. H. Darby, of Faith Lodge No. 200, was killed in a Collision, November 2, 1892.

**CLAIM NO. 896.** G. Hediger, of Main Line Lodge, No. 176, died from injuries received in a Wreck, November 18, 1892.

**CLAIM NO. 897.** Thomas E. Bennett, of Webster Lodge, No. 222, was declared totally disabled by Loss of Foot, November 19, 1892.

**CLAIM NO. 898.** Edgar G. Cole, of Puget Sound Lodge, No. 407, was killed in a Railway Accident, November 19, 1892.

**CLAIM NO. 899.** Wm. J. Barry, of Lehigh Lodge, No. 176, was killed by Explosion of Boiler, November 30, 1892.

**CLAIM NO. 900.** James J. Durkin, of Lake Erie Lodge, No. 241, died of Typhus Malarial Fever, December 8, 1892.

**CLAIM NO. 901.** Patrick T. Lundy, of Boston Lodge, No. 57, was run over and killed, December 8, 1892.

**CLAIM NO. 902.** Wm. Beebe, of Charter Oak Lodge, No. 286, was killed in a Collision, December 10, 1892.

**CLAIM NO. 903.** George E. Bowers, of Welcome Lodge, No. 72, was killed by Gun Shot Wound, December 16, 1892.

**CLAIM NO. 904.** Horatio P. Robertson, of Fidelity Lodge No. 185, died of Typhoid Fever, December 20, 1892.

**CLAIM NO. 905.** Joseph Ebers, of High Line Lodge, No. 256, was declared totally disabled by Loss of Leg, December 23, 1892.

**CLAIM NO. 906.** Edward McConnell, of Prospect Lodge, No. 162, died from Injuries received in a Railway Accident, Dec. 29, 1892.

**CLAIM NO. 907.** Thomas Prowell, of Pacific Lodge, No. 173, died from Injuries received in a Collision, December 30, 1892.

**CLAIM NO. 908.** Jeff. Brannin, of Vigo Lodge, No. 16, died of Nephritis, December 31, 1892.

**CLAIM NO. 909.** Jno. Tarkington, of W. H. Thomas Lodge, No. 159, died of Paralysis, December 31, 1892.

**CLAIM NO. 910.** Jno. Baldwin, of Metropolitan Lodge, No. 363, was killed in a Collision, January 6, 1893.

**CLAIM NO. 911.** John M. Whalen, of Orphans Hope Lodge, No. 466, died of Neuralgia, January 7, 1893.

**CLAIM NO. 912.** John A. McClelland, of North Pole Lodge, No. 152, was killed by Jumping from Engine, January 7, 1893.

**CLAIM NO. 913.** Chas. E. Gordon, of Red Mountain Lodge, No. 339, was killed by Falling Under Train, January 11, 1893.

**CLAIM NO. 914.** Geo. Stith, of Vigo Lodge, No. 16, was killed by Engine jumping track, January 13, 1893.

**CLAIM NO. 915.** Willame Spillane, of Calhoun Lodge, No. 84, was declared totally disabled by Loss of Foot, January 14, 1893.

**CLAIM NO. 916.** John Hohenlitner, of J. B. Maynard Lodge, No. 193, was killed by Railway Accident, January 15, 1893.

An assessment of TWO DOLLARS (\$2.00) has been levied for the payment of the above claims, and you are required to forward said amount for each member whose name appears on the rolls of membership FEBRUARY 1ST, 1893, (also for all members having taken a withdrawal (limited or final) after FEBRUARY 1ST, and for all members who died or were totally disabled since that date), said remittance to reach the Grand Lodge not later than FEBRUARY 20TH, 1893, as provided in Section 50 of the Constitution. Any lodge failing to make returns as above provided will stand suspended from all the benefits of the order, as per Section 52 of the Constitution.

Your fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

## BENEFICIARY STATEMENT.

OFFICE OF GRAND SECRETARY AND TREASURER,  
TERRE HAUTE, IND., JANUARY 1, 1893.

To Subordinate Lodges:

SIRS AND BROTHERS:—The following is a statement of the Beneficiary Fund for the month of December, 1892:

Received during month . . . . . 52,932 00

Total . . . . . \$71,526 75.

## DISBURSEMENTS.

By claims 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875 . . . . . \$58,500 00.

Balance on hand January 1, 1893 . . . . . \$13,025 75

Respectfully submitted,  
EUGENE V. DEBB.

## THE ROBINSON MONUMENT FUND.

The following subscriptions to the Robinson Monument fund have been received since our last report:

W. J. Overton, fireman, Paralta, Ia. . . . .	\$1 00
A. E. Kenney, Lodge No. 197, B. of L. F., Savanna, Ill. . . . .	1 00
J. H. Coy, O. R. C. Div. 87, Savanna, Ill. . . . .	1 00
A. C. Comstock, Agt., O. R. T., Stone City, Ia. . . . .	1 00
The above amounts were collected and forwarded by A. C. Comstock, of the O. R. T., Stone City, Ia.	
Sam J. Walker, fireman, San Bernardino, Cal. . . . .	50
John Buessell, Woodstock, Ind. Terr. . . . .	50
Robt. Buessell, Wellington, Kan. . . . .	50
Thomas McGrath, Bloomington, Ill. . . . .	1 00
Aaron Cunningham, Alton, Ill. . . . .	1 00
J. H. Cunningham, Alton, Ill. . . . .	1 00
Cedar Valley Lodge, No. 80, B. of L. F., Waterloo, Ia. . . . .	10 00
Previously reported . . . . .	864 32

Total . . . . . \$892 82  
Remittances should be directed to the LOCOMOTIVE FIREMEN'S MAGAZINE, Terre Haute, Ind.

## ADDRESS WANTED.

FRANK MCCLELLAN—A fireman who, when last heard from was working on the Mobile & Ohio. Anyone knowing of his whereabouts, will please correspond with J. O. Detwiler, Slater, Mo.

WILLIAM J. MURPHY—A member of Hub City Lodge No. 890, is requested to correspond with the secretary of his lodge. When last heard from, he was working on the Great Northern R. R., at Spokane Falls, Wash.

## JENNESS MILLER ILLUSTRATED MONTHLY.

The *Jenness Miller Illustrated Monthly* for January is the best issue of that magazine yet seen. Mrs. Miller begins a new department called "The World We Live In," full of useful hints and suggestions for women and young girls and comments on timely topics. Mrs. Miller also contributes an article entitled "The Charm of Individuality," which is in her best vein. There are a score and more of other interesting literary features, poems, sketches and a complete short story.

### IMMIGRATION.

---

The total area of the United States, according to the Commissioner of the General Land Office, is 3,057,407 square miles, exclusive of Alaska.

The population of the United States is now estimated at 65,000,000, which is an average of about 20 to the square mile.

The area of Europe is 3,806,769 square miles, or 749,362 square miles more than the United States. The population of Europe is about 296,000,000, an average of about 68 to the square mile, or about three and a half times greater than the average population per square mile of the United States.

In discussing the subject of immigration, it is of the first importance that we ascertain as nearly as practicable, the facts relating to the density of population in European countries, as also the density of population in the various states composing the American Republic.

Russia in Europe has an area of 2,266,983 square miles, which is 363,598 square miles more than one-half of the entire area of the European continent, and its population is only 32 to the square

mile, and with the exception of Sweden and Norway, is less dense than in any other European country.

There are four countries in Europe which have a population exceeding 200 to the square mile, as follows:

Great Britain and Ireland . . . . .	Area, 122,511 square miles . . . . .	Population 250
Italy . . . . .	Area, 109,734 square miles . . . . .	Population 236
Belgium . . . . .	Area, 11,366 square miles . . . . .	Population 425
Holland . . . . .	Area, 13,627 square miles . . . . .	Population 328

There are six countries in Europe whose population exceeds 100 to the square mile, as follows:

Germany . . . . .	Area, 210,468 square miles . . . . .	Population 190
France . . . . .	Area, 203,812 square miles . . . . .	Population 179
Austria and Hungary . . . . .	Area, 241,123 square miles . . . . .	Population 182
Portugal . . . . .	Area, 86,492 square miles . . . . .	Population 109
Switzerland . . . . .	Area, 15,716 square miles . . . . .	Population 160
Denmark . . . . .	Area, 15,307 square miles . . . . .	Population 126

There are seven countries in Europe whose population per square mile is less than 100, as follows:

Russia . . . . .	Area, 2,266,988 square miles . . . . .	Population 32
Spain . . . . .	Area, 192,957 square miles . . . . .	Population 83
Turkey . . . . .	Area, 144,004 square miles . . . . .	Population 80
Sweden and Norway . . . . .	Area, 293,918 square miles . . . . .	Population 20
Roumania . . . . .	Area, 46,700 square miles . . . . .	Population 98
Greece . . . . .	Area, 20,152 square miles . . . . .	Population 67
Servia . . . . .	Area, 16,820 square miles . . . . .	Population 72

We have given the average population per square mile in the United States at 20, and the average per square mile in Europe at 68. These are close approximations, but in some of the states the average population per square mile is so great that no effort is being made to attract foreign immigration, except on the part of individuals who are animated solely by a desire to reduce wages.

In discussing the subject of immigration understandingly, we should know in what states population is so sparse that immigrants would be of value, and in what states population is so dense that more population is not required, and the following tabulated exhibit, giving area of states, population, and population per square mile, will be of service to those who are studying the immigration question.

There are six states whose population exceeds 100 to the square mile as follows:

	Square miles.	Population	per. sq. mile.
Rhode Island . . .	Area, 1,250.	Population, 345,506 . . .	293
Massachusetts . . .	Area, 8,315.	Population, 2,238,913 . . .	269
New Jersey . . .	Area, 7,815.	Population, 1,444,933 . . .	185
Connecticut . . .	Area, 4,900.	Population, 746,268 . . .	152
New York . . .	Area, 49,170.	Population, 5,997,853 . . .	122
Pennsylvania . . .	Area, 45,215.	Population, 5,258,014 . . .	117

It is quite possible that the foregoing states have all the population they require. Certainly if restricted to their own area, they have more than they can feed. Like certain European countries, they are largely dependent upon other states for food, a fact which exalts the importance of our great transportation facilities.

There are five states which have a population per square mile between 50 and 100, as follows:

	Square miles.	Population	per. sq. mile.
Indiana . . . .	Area, 36,850.	Population, 2,192,404 . . .	60
Illinois . . . .	Area, 56,650.	Population, 3,826,351 . . .	66
Maryland . . . .	Area, 12,210.	Population, 1,042,390 . . .	85
Delaware . . . .	Area, 2,050.	Population, 168,493 . . .	82
Ohio . . . . .	Area, 41,060.	Population, 3,672,316 . . .	87

If we except in the foregoing list Delaware and Maryland, the other states could easily feed more than twice the present population and, therefore opposition to foreign immigration, is not as yet specially pronounced, except as to cities within their borders—where, unfortunately, the greatest per cent. of foreign immigrants locate and come in competition with all classes of labor.

There are eighteen states which have a population ranging from 20 to 50 per square mile, as follows:

	Square miles.	Population	per. sq. mile.
Maine . . . . .	Area, 33,040.	Population, 661,086 . . .	20
North Carolina . . .	Area, 52,250.	Population, 1,617,947 . . .	21
Arkansas . . . .	Area, 53,850.	Population, 1,128,179 . . .	20
Louisiana . . . .	Area, 48,720.	Population, 1,118,587 . . .	27
Mississippi . . . .	Area, 46,810.	Population, 1,289,600 . . .	28
Alabama . . . .	Area, 52,250.	Population, 1,513,017 . . .	28
Georgia . . . . .	Area, 59,475.	Population, 1,837,353 . . .	31
Iowa . . . . .	Area, 56,025.	Population, 1,911,896 . . .	34
Michigan . . . .	Area, 58,915.	Population, 2,093,889 . . .	36

Missouri . . . .	Area, 69,415.	Population, 2,679,184 . . . .	38
South Carolina .	Area, 30,570.	Population, 1,151,149 . . . .	34
Vermont . . . .	Area, 9,565.	Population, 332,422 . . . .	35
Wisconsin . . . .	Area, 56,040.	Population, 1,688,800 . . . .	30
West Virginia .	Area, 24,780.	Population, 762,799 . . . .	31
Virginia . . . .	Area, 42,450.	Population, 1,655,980 . . . .	39
New Hampshire .	Area, 9,305.	Population, 376,530 . . . .	41
Tennessee . . . .	Area, 42,050.	Population, 1,767,518 . . . .	42
Kentucky . . . .	Area, 40,400.	Population, 1,858,635 . . . .	46

If from the foregoing list we except Vermont and New Hampshire, the conclusion is that a far denser population would not be objectionable, and could be supported, hence we hear of no pronounced uprising of the people demanding a restrictive policy relating to foreign immigration.

There are nineteen states and territories which have a population ranging from 1 to 20 to the square mile as follows:

	Square miles.		Population per. sq. mile.
Kansas . . . .	Area, 82,080.	Population, 1,427,096 . . . .	17
Minnesota . . .	Area, 83,365.	Population, 1,301,826 . . . .	16
Nebraska . . . .	Area, 76,855.	Population, 1,058,910 . . . .	14
Texas . . . . .	Area, 265,780.	Population, 2,235,523 . . . .	9
California . . .	Area, 158,360.	Population, 1,208,130 . . . .	8
South Dakota .	Area, 74,550.	Population, 328,808 . . . .	5
Colorado . . . .	Area, 103,925.	Population, 412,198 . . . .	4
Washington . .	Area, 69,180.	Population, 349,390 . . . .	5
Oregon . . . . .	Area, 96,030.	Population, 313,767 . . . .	4
North Dakota .	Area, 74,550.	Population, 182,797 . . . .	3
Florida . . . . .	Area, 58,680.	Population, 391,422 . . . .	7
Oklahoma . . . .	Area, 50,000.	Population, 61,834 . . . .	2
New Mexico . .	Area, 122,580.	Population, 153,593 . . . .	2
Utah . . . . .	Area, 84,970.	Population, 207,906 . . . .	2
Idaho . . . . .	Area, 84,800.	Population, 84,385 . . . .	1
Montana . . . .	Area, 146,090.	Population, 132,159 . . . .	1
Nevada . . . . .	Area, 110,700.	Population, 45,761 . . . .	1
Wyoming . . . .	Area, 97,800.	Population, 60,705 . . . .	1
Arizona . . . .	Area, 113,020.	Population, 59,620 . . . .	1

The examination of the foregoing list of states and territories is immensely suggestive. It shows that there is an area of 552,-400 square miles with a population nominally of *one* person to the square mile, but in fact less than one person. An area of 202,350 square miles with a population of *two* persons to the square mile;

74,550 square miles with a population of *three* to the square mile; 199,955 square miles with a population of *four* to the square mile; 143,730 square miles with a population of *five* to the square mile. In fact, taking the entire area of the 19 states and territories, 1,950,405 square miles more than the entire area of Europe, omitting Russia, and the average population is only 6 to the square mile.

We have said that the average population of the United States per square mile, is about 20, but it is seen by the foregoing exhibit that there is more than one-half of the entire area where the average population is only 6 to the square mile, and where there is room for more men and women, provided they can be induced to settle in these vast states and territories.

It is not required for the MAGAZINE to emphasize the declaration, that we are not in favor of the importation of the vagabond class of Europeans of any nationality. The vicious, the infirm, idiots and insane, when they attempt to land in America, we would have returned to the country from whence they came. But we have repeatedly gone upon record as having no sympathy with those who are everlastingly shouting "pauper labor." Paupers do not labor—hence, when any country seeks to dump upon our shores its pauper or dependent class, we would have them speedily sent back. But a man who receives a dollar a day or less for his labor and lives—paying his expenses, is no more a pauper than the man whose income is \$1,000 a day. Let us be done with the "pauper labor" talk, because men who work for a living, regardless of nationality, are not paupers.

From the foundation of the Government up to 1820, United States authorities say no record was kept of foreign immigration, but it is assumed that during that period, about 36 years, 250,000 foreign immigrants arrived. From 1820 to 1890 the records show that 15,400,000 immigrants arrived, making the total from the foundation of the government 15,650,000. During the year 1890 the arrivals amounted to 455,302. Of these 443,225 were from Europe, and from other countries 12,077.

To enable the reader to have a correct idea relating to the nationality of European immigrants we append the following tabulated statement of the Treasury Department at Washington City. It is

for the year ending June 30, 1890, and will be found valuable for reference when men are discussing the immigration question:

COUNTRIES OF LAST PERMANENT RESIDENCE OR CITIZENSHIP.	Males.	Females.	Total.	Per cent. of Females.
<b>Austria-Hungary—</b>				
Bohemia . . . . .	2,851	2,154	4,505	48
Hungary . . . . .	16,589	5,478	22,062	25
Other Austria (except Poland) . . . . .	21,077	8,555	29,632	29
<b>Total . . . . .</b>	<b>40,017</b>	<b>16,182</b>	<b>56,199</b>	<b>29</b>
<b>Belgium . . . . .</b>	<b>1,719</b>	<b>922</b>	<b>2,671</b>	<b>36</b>
<b>Denmark . . . . .</b>	<b>5,713</b>	<b>3,653</b>	<b>9,366</b>	<b>39</b>
<b>France . . . . .</b>	<b>3,863</b>	<b>2,722</b>	<b>6,585</b>	<b>40</b>
<b>Germany . . . . .</b>	<b>50,923</b>	<b>41,504</b>	<b>92,427</b>	<b>45</b>
<b>Gibraltar . . . . .</b>	<b>5</b>	<b>4</b>	<b>9</b>	<b>44</b>
<b>Great Britain and Ireland—</b>				
England . . . . .	34,245	22,775	57,020	40
Scotland . . . . .	6,833	5,208	12,041	43
Ireland . . . . .	26,344	26,680	53,024	50
Wales . . . . .	384	266	650	41
Great Britain, not specified . . . . .	12	7	19	37
<b>Total . . . . .</b>	<b>67,818</b>	<b>54,936</b>	<b>122,754</b>	<b>45</b>
<b>Greece . . . . .</b>	<b>464</b>	<b>60</b>	<b>524</b>	<b>11</b>
<b>Italy . . . . .</b>	<b>40,717</b>	<b>11,082</b>	<b>51,799</b>	<b>21</b>
<b>Sicily . . . . .</b>	<b>135</b>	<b>69</b>	<b>204</b>	<b>34</b>
<b>Malta . . . . .</b>	<b>1</b>	<b>1</b>	<b>2</b>	<b>50</b>
<b>Netherlands . . . . .</b>	<b>2,655</b>	<b>1,671</b>	<b>4,326</b>	<b>39</b>
<b>Norway . . . . .</b>	<b>6,601</b>	<b>4,769</b>	<b>11,370</b>	<b>42</b>
<b>Poland . . . . .</b>	<b>7,613</b>	<b>3,460</b>	<b>11,073</b>	<b>31</b>
<b>Portugal . . . . .</b>	<b>109</b>	<b>49</b>	<b>158</b>	<b>31</b>
<b>Roumania . . . . .</b>	<b>260</b>	<b>257</b>	<b>517</b>	<b>50</b>
<b>Russia (except Poland) . . . . .</b>	<b>21,097</b>	<b>12,050</b>	<b>33,147</b>	<b>36</b>
<b>Finland . . . . .</b>	<b>1,666</b>	<b>785</b>	<b>2,451</b>	<b>32</b>
<b>Spain . . . . .</b>	<b>619</b>	<b>194</b>	<b>813</b>	<b>24</b>
<b>Sweden . . . . .</b>	<b>16,532</b>	<b>13,100</b>	<b>29,632</b>	<b>44</b>
<b>Switzerland . . . . .</b>	<b>4,406</b>	<b>2,587</b>	<b>6,993</b>	<b>37</b>
<b>Turkey in Europe . . . . .</b>	<b>171</b>	<b>35</b>	<b>206</b>	<b>17</b>
<b>Total Europe . . . . .</b>	<b>273,104</b>	<b>170,121</b>	<b>443,225</b>	<b>38</b>

In so far as we are to form a conclusion the objectionable immigrants come from Italy, Russia, Hungary and Poland. For the year 1890 these countries supplied the United States with the following number of immigrants, male and female:

Italy . . . . .	51,799
Russia . . . . .	33,147
Hungary . . . . .	22,062
Poland . . . . .	11,073
<b>Total . . . . .</b>	<b>118,081</b>

This leaves 325,144 immigrants from other European countries to whose coming we hear no special objection. It is here that the question arises, Is it proposed to shut the door to all, that the objectionable may be excluded?

The first direct and powerful enemy to immigration to America, was King George III. of England. So pronounced was his opposition, that it forms one of the reasons urged in the Declaration of Independence why the Colonies should throw off the English yoke and demand their independence. The arraignment of the King was as follows:

"He has endeavored to prevent the population of these states; for that purpose obstructing the laws of naturalization of foreigners, refusing to pass others to encourage their migration hither, and raising the condition of new appropriations of land."

Among the most odious laws ever placed upon the statute books of the nation, were what are known as the "alien and sedition laws," passed under the administration of John Adams, and swept out of existence under the administration of Thomas Jefferson. Nor was the spirit of those laws ever revived except when the Know-Nothing craze swept over the country during the 50's.

The hue and cry is now being revived—and, strange to say, in many instances, labor is being used to urge the passage of prohibitory laws—when if labor is true to itself, it should be the first to denounce all laws in anywise abridging the rights of those who wear its badge.

The laws that have been enacted during the past ten years, it would seem, are sufficient to relieve the country of all objectionable characters from foreign lands seeking a residence in the United States. In the first place every foreigner who lands upon our shores must pay 50 cents for the privilege, and there is a law to send all convicts back to the country from which they migrated. There is a law prohibiting the importation and immigration of foreigners and

aliens under contract or agreement to perform labor, and all such contracts are void—and the penalties for violating the law are severe—and the latest law passed March 3, 1891, prohibits the introduction of idiots, insane persons, paupers or such as are likely to become a public charge, persons suffering from loathsome diseases or convicted of felony and infamous crimes, polygamists, etc.; penalties are imposed upon captains of vessels of fine and imprisonment, and the law forces them to take back within a year after landing undesirable persons. Such statutes indicate pretty conclusively that the United States, if the laws are administered, is in a position to keep out immigrants of undesirable quality. But it seems to be the purpose of some persons to shut out all foreigners who desire to become citizens of the United States. We do not believe Congress can be induced to pass such a law.

---

## INDUSTRIAL PEACE.

---

The Boston *Labor Leader*, of December 24th, 1892, publishes a number of contributions on "Industrial Peace." Among the contributors is Mr. Edward Atkinson, the inventor of the Aladdin oven, a writer of operas, a robust hater of labor organizations and probably the most ardent and uncompromising friend of scabs on the continent.

Mr. Atkinson is eminently spectacular. His self-importance could not be improved if he were a peacock or a turkey gobbler, but the real fun of the thing is the way he starts off. "Industrial Peace" acts like a plummet in deep sea soundings—brings up things that set scientists to guessing. Mr. Atkinson evidently believes he has discovered the key that lets him into the secrets of what constitutes "industrial peace," and as the Yankees say, he is "tickled;" as delighted as the small boy with a tin whistle or a kite, and is as satisfied with himself as were his ancestors when they hung a witch or whipped a Quaker.

One of the peculiarities of Mr. Atkinson is to introduce his dis-

coveries in science and philosophy with Baconian profundities of dictum which he intends shall overwhelm his hearers. When he discovered that a workingman could get a square meal on three cents (provided he cooked his radishes in his Aladdin oven), his utterances were characterized by explosions of knowledge of dynamite detonation, and the same was true when he told the factory hands of Rhode Island they were capitalists and *employed* the millionaire proprietors of the mills.

In discussing "industrial peace" Mr. Atkinson is equally deep, as for instance, he says "industrial peace is to be found in personal liberty," and "personal liberty is maintained when men and women work for whom they please, at such prices as they please and as many hours as they please;" that is to say, there should be no labor organization to dictate terms, all should be as free and independent as scabs. If a union man receives \$2.00 a day it is entirely legitimate and in consonance with "industrial peace" for a scab to offer to do the work at \$1.00 a day, and for organized labor to kick is to create industrial war, which the state ought not to tolerate. Mr. Atkinson's idea is to organize a great union of scabs to strike down organized labor, which Mr. George E. McNeill, in the *Labor Leader*, characterizes as follows:

The project to form a trades union of men who will not unite upon the question of their wages and hours of labor, but will unite in a grand go-as-you-please scramble for place, reminds me of the military company that voted to parade in time of peace and to disband in time of war.

In this Christmas time our imagination is greatly awakened and the spirit of good will quickened, but I confess that in the wildest flight of dreams well told none can compare with the dream of a union of non-unionists. Toady workers can combine as toadies, tramps may operate in groups, scabs will appear in numbers where the virus of competition manifests itself on the putrid surface of an enterprise thieves do combine to steal, but a union of non-unionists can only find its parallel in Dante's Inferno.

\* \* \* \* \*

Liberty is not effeminate, not a toady, not even an Atkinsonian statistician. Liberty is not blind to wrong. Liberty is a spirit, a sentiment, a fact. It finds its best expression in the collective will of men organized for mutual welfare.

Mr. Atkinson evidently believes that industrial peace is industrial degradation; that peace means submission, and that organization means war, in all of which Mr. Atkinson is absolutely correct.

Mr. Atkinson knows several young men who are anxious to engage in the work of unionizing scabs for the purpose of securing industrial peace. If these young men can manage to buy a square meal for three cents, and can unionize scabs on that sort of a dietary platform it may be that the time is not distant when American workmen will be able to eat garbage with a relish and beat the Dagoes and Huns at their own game.

Industrial peace will come with industrial victory. It will be brought about by industrial valor. It will not come by disbanding labor organizations nor in declaring that the strike, as a weapon, is to be wielded no more. Mr. Atkinson may be able to impress upon New England scabs the glory of that sort of "personal liberty" enjoyed by those base born creatures who are willing to live on a square meal costing three cents, and to obtain the three cents agree to work for the special benefit of those who reduce them to slaves. But we surmise that even with a Dago constituency he will find his plans something less than a dazzling success.

---

## THE INTER-STATE COMMERCE COMMISSION.

The latest report of the inter-state commerce commission is an exceedingly interesting document, and will secure deserved attention in railroad, legislative and legal circles. It is well known that it required about twelve years for congress to pass the law creating the inter-state commerce commission. In both houses of congress there are men said to be eminent as lawyers—men learned in every department of jurisprudence. The bill, in its progress, was fought by the most powerful lobby ever organized in Washington City. Every word, paragraph and sentence was subjected to the most searching scrutiny, but, finally, when the law was placed upon the statute books, it was found to be in many regards defective and requiring amendments, and in the report of the commission the amendments demanded are pointed out.

Referring to the necessity for the law creating the commission, the report says :

During twenty years prior to such enactment, the extraordinary construction of railways under enormous grants of public lands, private donations, aid of county, town and municipal bonds, freely and often inconsiderately given through a passionate desire for these public highways, railway capital secured under exacting conditions, lavish expenditure and reckless management, establishment of branch or feeding lines to the main stem in order to monopolize business in tributary territory, rivalry of lines to take possession of districts in the hope of future business, causing duplication of roads in sparse regions not able to support a single line, all resulted in capitalization far exceeding cost and a railway system of vastly greater carrying capacity than the volume of traffic seeking transportation. The fiercest competition was thus rendered inevitable, and the necessity of earnings to meet fixed charges and operating expenses tempted resort to every device by which to obtain business on any terms. In less degree the same conditions existed in the more developed sections of the country. Public regulation was not then looked upon with favor. Transportation facilities were treated as private property subject to bargain and sale like merchandise, and railroad managers were hostile to any form of government supervision. Special rates and rebates were recognized features of railroad operation; favoritism between shippers was not thought dishonest, though the favored shipper secured a monopoly through the ruin or withdrawal of competitors, and to treat prevailing practices as criminal misdemeanors was regarded with ridicule. This conduct aided the formation and fortified the power of those vast combinations of capital which created public alarm. Whoever will read the report of the Cullom committee to the senate in 1886 will be astounded by the magnitude and extent of railroad abuses brought to light by their investigation.

The statistician of the commission makes an exhaustive report relating to railway mileage, the organization of railways, equipment, employes, capitalization and valuation, earnings and expenses and accidents, for the year ending June 30th, 1891. The total *single* track mileage in the United States at the date named was 168,402, and the total mileage of all tracks was 216,149 miles. On the 30th of June, 1891, there were "1,785 railway corporations, of which 889 were independent companies for the purpose of operation, and 747 were subsidiary companies, the remainder being private lines. The report further shows that 16 roads have been abandoned during the year, and that 92 roads, representing a mileage of 10,116.25, have disappeared by purchase, merger or consolidation. The actual number of railway corporations in 1891 is less than the number which existed

in 1890, notwithstanding the fact that a considerable number of new lines were chartered during the year. The tendency toward consolidation is clearly indicated by the report. On June 30, 1891, there were 42 companies, each of which controlled a mileage in excess of 1,000 miles, and nearly one-half of the mileage of the country is the property of these 42 companies." In the matter of equipment it is shown that the total number of "locomotives used by the railways of this country was on June 30, 1891, 32,139, showing an increase of 1,999 during the year, and the total number of cars, the property of railways, was 1,215,611, showing an increase of 45,944 during the year. The number of locomotives per 100 miles of line was 20; the number of passenger cars per 100 miles of line was 17; and the number of freight cars per 100 miles of line was 714." It is shown by the report that the number of men employed on railways in the United States for the year ending June 30, 1891, was 784,285, being an increase of 34,984. The number of men employed per 100 miles of line was 486, and the extent to which "organized industry has increased the efficiency of labor is shown by the fact that every engineer, during the year, has on an average carried 369,077 passengers one mile and 2,329,639 tons of freight one mile." In the matter of capitalization, it is shown that the roads are valued by their owners at \$9,829,475,015, or \$60,942 per mile of line. It is shown that the gross earnings of the roads for the year ending June 30, 1891, amounted to \$1,096,761,395, or \$6,801 per mile of line, and that the operating expenses amounted to \$731,887,893, or \$4,538 per mile of line, leaving the net earnings from operation \$364,873,502, or \$2,263 per mile of line. Referring to accidents, the report shows that casualties "during the year ending June 30, 1891, are greater than in any previous year covered by reports to the commission. The number killed during the year was 7,029, and the number injured was 33,881. Of these totals, the number of employees killed was 2,660 and the number injured was 26,140. The number of passengers killed was 293, and the number injured was 2,972. A classification of casualties according to the kind of accident shows 415 employees were killed and 9,431 injured while coupling and uncoupling cars; 598 were killed and 3,191 injured falling from trains and engines; 78 were killed and 412 were injured from overhead obstructions; 303 were killed and 1,550 were injured in collisions; 206 were killed and 919 were injured from de-

railment of trains; 57 were killed and 319 were injured from other accidents to trains than collisions and derailments already mentioned; 20 were killed and 50 injured at highway crossings; 127 were killed and 1,427 were injured at stations; the balance, which makes up the total of 2,660 killed and 26,140 injured, is due to accidents which do not naturally fall in the classification adopted for report. Referring to passengers, 59 were killed and 623 injured by collisions; 49 were killed and 837 injured by derailments; 2 were killed and 34 injured by other train accidents; the balance, making up a total of 293 killed and 2,972 injured, being assignable to accidents at highway crossings and at stations and to other kinds of accidents."

The report emphasizes the necessity for legislation compelling railways to adopt train brakes and automatic couplers. Casualties are steadily increasing in number, and the report says that "during the year ending June 30, 1891, 1 employe was killed for every 296 employes, and 1 employe injured for every 30 men in railway service. The corresponding figures for the previous year are, 1 man killed for every 306 employes, and 1 man injured for every 33 employes. This same fact is also presented in another manner. The increase in the number of employes killed during the year covered by the report over the previous year is 9 per cent., and the increase in the number injured is 17 per cent., while the increase in the number of men taken into employment is less than 5 per cent. The corresponding comparison for casualties to passengers shows that, while there has been a relative decrease in the number of passengers killed, the number of passengers injured shows a much greater increase than the increase in the number of passengers carried. On the whole, the comparison of accidents for the two years leaves a very unsatisfactory impression, since it shows that liability to accident was greater during the year covered by this report than during the previous year." The foregoing furnishes the readers of the MAGAZINE the more important features of the report of the inter-state commerce commission, and the statements made and the figures furnished may be accepted as approximately correct, and therefore answer the valuable purpose of data upon which to construct arguments and arrive at rational conclusions.

## STANDING ARMIES.

---

Some time since, Edward Everett Hale, writing of "Social Problems," in the *Cosmopolitan*, had a chapter on Republics, in which he said:

Quite fundamental in the republican idea is the abolition of large standing armies. The true republican expects that every man shall be a soldier and do his duty in repelling foreign invasion. It almost follows that in a true republic there are no wars of conquest. The republic of France, at this moment, is taxing itself beyond all measure simply to maintain an army which shall approach the strength of the army of Germany or that of Russia. If you asked the Czar of Russia, or the Emperor William, in public, why Russia or Germany maintain such large armies, the answer would be an appeal to national pride and a declaration that it is necessary to maintain such forces in order to preserve the independence of the respective empires. But if you could get the Czar of Russia or the Emperor William into a confessional, and if he should tell you the absolute truth, certain that it would not be proclaimed anywhere else, he would say, "I should not remain on my throne a month if I did not have an army."

Manifestly, Mr. Hale states the republican idea correctly. He states the American idea correctly. It was the intention of the founders of the American Republic never to have a large regular or standing army. They knew that such an army would be a perpetual menace to the liberties of the people; hence, congress alone has power to raise and support armies. But here comes in a provision that congress cannot appropriate money to support armies for a longer period than two years; hence, if the appropriation is not made the armies become practically disbanded.

The purpose of the fathers of the republic is seen at a glance. They did not intend that the liberties of the people should be crushed by a standing army or a "regular" army, and, therefore, the power to raise and support armies was left with congress, the people's representatives. But to make it doubly sure that a standing army—always and everywhere a menace to liberty—if raised, should not exist longer than two years, congress itself is forbidden to appropriate money for its existence for a period longer than two years. Every two years the people choose their representatives in congress, and thus hold the power in their own hands.

Let us see what has been the practice of the republic from the first, in the matter of raising and supporting standing armies:

Date.	Strength of Army.
1789, 1 Regiment Infantry 1 Bat. Artillery . . . . .	840
1792, Indian Border wars . . . . .	5,120
1794, Peace establishment . . . . .	3,629
1801, Peace establishment . . . . .	5,144
1807, Peace establishment . . . . .	3,278
1810, Peace establishment . . . . .	7,154
1812, War with Great Britain . . . . .	11,831
1815, War with Great Britain . . . . .	9,413
1817-1821, Peace establishment . . . . .	9,980
1822-1832, Peace establishment . . . . .	6,184
1833-1837, Peace establishment . . . . .	7,198
1838-1842, Florida War . . . . .	12,530
1843-1846, Peace establishment . . . . .	8,613
1847, Mexican War . . . . .	17,812
1848, Mexican War . . . . .	30,890
1849-1855, Peace establishment . . . . .	10,320
1856-1861, Peace establishment . . . . .	12,931
1862, Civil War . . . . .	39,273
1863-1866, Civil War . . . . .	43,332
1867, Peace establishment . . . . .	54,641
1868-1869, Peace establishment . . . . .	52,922
1870, Peace establishment . . . . .	37,313
1871, Peace establishment . . . . .	35,353
1872-1874, Peace establishment . . . . .	32,264
1875-1885, Peace establishment . . . . .	27,489
1892, Practically the same as 1885.	

The question arises, what service is this standing army of 27,489 men and officers performing for the country? Some of them are watching Indians, keeping them on their reservations, where a gang of thieves, paid to deal justly by the savages, are robbing and starving them to death; facts proven and denounced in the United States Senate. A portion of our army is housed up in forts scattered over the country, where the officers, in gaudy attire, attend balls and give gorgeous receptions, assume to be the aristocracy, for which the people are taxed from \$30,000,000 to \$50,000,000 a year, and in addition to this the government military mill annually grinds out a set of officers who are enabled by their salaries, to make angels turn up

L F M 2 Mar 93

their noses in silent scorn of their worse than turkey gobbler struttings.

But, within a few months past, this "regular army" has been put to a use never dreamed of by the fathers of the American republic. It has been degraded by the president of the United States, who is commander-in-chief, to stand guard at the Couer d'Alene mines in Idaho, while a Christless gang of capitalists imported scabs, black, white and tan, to displace honest laborers, a work which the standing armies of Europe has performed for a thousand years and will continue to perform as long as workingmen permit it to be done.

There may be in some autocrat-cursed country an exhibition of military power more imposing, more impressive and degrading than was seen at Homestead, Buffalo, in the mountains of Tennessee and Idaho, but we have not read of it; and if in the king-cursed countries some things in the same line have occurred, we may thrust them aside and contemplate what the military machines are now doing in the great American republic, not to drive back foreign invaders, not to keep half-starved savages on their reservations, but to enable capitalists to crush organized labor, where gleaming bayonets, flashing swords and big and little guns, loaded with shot and shell, command organized workingmen to stand aside while degenerate scabs willingly respond to the command of their masters to accept wages which transform American homes into dens and lairs, fit only for wild beasts, bats and vermin.

From this time forward, if workingmen so will it, they will find themselves the victims of state standing armies, as much so as the subjects of the Czar of Russia or Emperor William of Germany, who, as Mr. Hale remarks, could not remain on their thrones a month were it not for their standing armies.

And just here a remarkable feature of the subject comes into view. These standing armies of states are largely made up, rank and file, of workingmen, men from every department of the industries of the country, who, at a moment's warning, may be called upon to stand guard while scabs, as at Homestead and Buffalo, step in and accept such wages as employers see proper to pay, and thus become the architects of their own degradation.

## SHORT STUDIES IN POLITICAL ECONOMY.

---

BY WILFRED P. BORLAND.

No. 3.

We have now a definition of both wealth and capital; let us keep them in mind. The procurement of wealth, either for the immediate satisfaction of wants, or to be set aside for future gratification, is the end and object of all human exertion. It is from that portion of wealth, which is set aside for future uses that capital is drawn. The production of wealth requires the co-operation of three factors: land, labor, and capital. Two of these factors—land and labor—are absolutely necessary; the third—capital—is a contingent factor, it is taken in as a partner of land and labor for the purpose of securing an increased product. To illustrate: A man digs clams with his hands, and carries them to market in his arms. This is the primitive and necessary process, the clams thus procured are wealth which is the the product of labor applied to land. The work is laborious, and the product comparatively small, being but little more than sufficient to satisfy immediate wants. In the course of time enough wealth is secured in this way so that a spade and wheelbarrow is secured. Our man has now brought capital to his aid, he digs clams with his spade instead of with his hands, and takes them to market in his wheelbarrow. His labor is lightened and his product increased, he finds it much easier to supply his immediate wants, and he is enabled to set aside a larger portion of wealth for future needs. After a time he discards the wheelbarrow and gets a horse and wagon in its stead. His labor is still further lightened and his product still further increased, he can take a larger load and do it in much less time than formerly, and by this means much of the time consumed in traveling between the market and his work is saved to be devoted to procuring more clams. As his wealth increases our man finds it profitable to employ some one to dig clams for him, devoting his entire time to the labor of transporting them to market and disposing of them. The product is now still further increased, and the person employed to dig clams receives his wages out of this increased product, he creates his own wages as he labors; the capital employed in the business is not even momentarily lessened by reason of the payment of wages. Our man next finds it profitable to employ other workmen and secure increased facilities for transportation; he becomes the owner of several teams and employs several workmen, and he devotes his entire time to the superintendence and direction of the workmen. Our man has now become a full

fledged capitalist; he employs many workmen to dig clams and drive his teams for him, paying them their wages out of the product of clams which their labor secures and transports to market, and taking his pay as capitalist out of what is left after such payment is made.

Now observe that there are two absolutely necessary factors—land and labor—always present in this process of production, as there is in all wealth production; remove all this capital and the business of producing clams might still go on, though in a more laborious and less satisfactory manner; but remove either the labor or the land and the product must inevitably cease. It might be well here to note that fallacious assumption: capital limits industry. The sense in which this assumption is used is that capital must first supply labor with tools, materials and subsistence before labor can be exerted at all, as for instance:

“There can be no more industry than is supplied with materials to work up and food to eat. Self-evident as the thing is, it is often forgotten that the people of a country are maintained and have their wants supplied not by the produce of present labor, but of past. They consume what has been produced, not what is about to be produced. Now of what has been produced a *part* only is allotted to the support of productive labor, and there will not and cannot be more of that labor than the portion so allotted (which is the capital of the country) can feed and provide with the materials and instruments of production.”—J. S. Mill.—“Principles of Political Economy.”

This is, substantially, the statement to which I referred in a former paper of this series, viz: that until capital furnishes the subsistence and the opportunity, labor cannot be exerted but must remain idle. It has all the force of an axiom in the standard economy, but it is nevertheless based upon a monstrous fallacy. To return to our clam digger: If the proposition that capital limits industry is correct then unless he had devoted a certain amount of capital to the business of digging and transporting clams, none of the workmen whom he employed could have dug or transported clams, but they must remain idle until capital had entered into the business in an amount sufficient to employ and maintain them. But is this true? We have seen that our capitalist originally produced clams without capital. Was he dependent upon capital for the privilege of exerting his labor? Did capital in any manner limit or restrict his exertion of labor? Certainly not, the only limit to the exertion of his labor was his access to the land from which the clams were dug. That capital limited the form and the productiveness of his industry is quite true, without the spade and the wheelbarrow he must have continued to dig clams with his fingers and transport them in his arms, and without the horse and wagon he must be content to transport his clams in the wheelbarrow, but to say this is not to say that wanting the spade, wheelbarrow, or horse and wagon, he could dig and transport no clams, and this is the proposition we are expected to believe. The standard economy does not say that capital limits the form, or the productiveness of

industry. It says that capital limits the *exertion* of industry. What is true of our capitalist clam digger is also true of the workmen he employs; the form and productiveness of their labor is limited by the capital which they use, but the *exertion* of their labor is limited, as in the case of their employer, only by their access to the land from which clams are obtained. What is true in this case is true of all the processes in the production of wealth, though the true relations between labor and land may not be so obvious upon first sight by reason of the complexities in the productive processes. The term land, in political economy, embraces all natural elements and opportunities whatsoever: in short everything freely supplied by nature to man is included in the term land. The true and natural relations between labor and capital, are those of partners in the business of production. Labor is the active force, land the passive; capital comes in merely as an aid to labor and thus becomes a natural sharer in the product. Capital has been diverted from its true functions; men who have possessed capital, instead of putting it to its natural uses, have used it for the purpose of securing an unjust advantage over labor, and have succeeded in making labor the slave instead of the partner of capital. They have been enabled to do this because of unjust and immoral social adjustments. When capital is once relegated to its true position in the business of production, there shall be no more talk of war between labor and capital.

## THE COMING CIVILIZATION.

BY JOSÉ GROS.

No. 3.

The principal object of the two preceding articles and the present one is to meet or anticipate the objections that are usually presented against all social reforms, most especially when they are fundamental. Such objections always come from people high up in intelligence, wealth, position, piety, etc. They want to give us the impression that the reforms in question do not enter into the divine plans. For them human life on earth must be more or less of a failure all along. For them the cardinal aim of every one of us should simply be, how we can squeeze ourselves into heaven after a life of sorrow and sin. That low conception of our human existence kills all initial force for human improvement, along fundamental lines, anyhow. It is essentially heathenish, that conception. It simply means that we cannot develop the normal man, much less the normal social organiza-

tion; and such barbarous theories are made to rest on that very book which proclaims all that is grand and beautiful among men. We are then forced to resort to that book to prove the feasibility of all fundamental reforms. "With righteousness shall the Lord judge the world, and the people with equity." Psalm xlvii, verse 9. What did the Psalmist mean by that? Was he conscious of what he was saying? It does not make much difference about that. God's truth does not lose anything of its intrinsic beauty when uttered by lips, apart from the consciousness of the individual. Suppose we try to analyze those words under the light of social science; all science comes from God, after all.

The verse in question seems to distinguish between the world and the people. What is the world? What is the people? The world, applied to humanity, seems to mean the vanities, the selfishness, infatuations, the thirst for wealth and power, the excitements, turmoils and fashions, the pleasures and gratifications of the hour, regardless of what we owe to God and our fellow-men; and above all, pre-eminent over all, the world means indifference towards social righteousness, provided we are well off or better than the many below.

Now let us see what is the meaning of those two grand words, the people. We generally take for granted that the people are the many who work, and produce, and make human societies possible; the many in the humble ranks of life; those who, as a totality, cannot be very selfish, because their resources are very limited, and so they have not had the opportunity of being spoiled as yet. We shall allow that a certain number among the working masses belong to the world and a certain number in the upper ranks belong to the people, the latter because in love with humanity and working for social righteousness, and the former because craving to rise up to the upper levels, regardless of any sound principles!

Be the above as it may, we must acknowledge that the people means the many, and hence, the world means the few, in the verse above mentioned. Also, that the people means the bulk of those who have to work hard for a bare living in most cases, if not always; and hence, the world means, at least, in part, the bulk of those few who don't need to work hard for a living and fail to work for the general upheaval of the classes below through fundamental social reforms, as that alone can bring permanent good results.

It is but logical to assume that the few who have or could have leisure, absence of hard work, and so time for study, that they are under greater responsibilities, in God's eyes, than the many for whom life is a constant wear and tear of brain or muscle, or both, indispensable to face the most absolute or pressing needs of our earthly existence. Hence, the sins of the latter must be less fatal than the sins of the former, or less sinful in God's eyes, because there is an intimate relation between physical and spiritual poverty, from the fact that the soul on earth can only act through that envelope that we call the body.

At all events the world and the people are two distinct fragments

of humanity, according to the Psalmist; and the world, the few, are to be judged with righteousness, and the people, the many, with equity. What can God, through the Psalmist, mean by that? Before we try to ascertain it let us see if we can give a precise definition of the two words in question, righteousness and equity. We suggest as follows:

Equity is the moral law applied to our personal and social relations.

Righteousness is the moral law applied to all thoughts, acts and emotions in relation to self, to men and to God. Righteousness includes equity; equity leads into righteousness.

Now let us see what Jesus meant by The World. All that is contrary to God's laws of righteousness. He came to fulfill the law and the prophets. Have Christian civilizations ever been fond of establishing righteousness on earth? "My peace I leave with you," said that same Jesus. What kind of peace have we developed on the face of the planet through the last sixteen centuries of social growth, controlled by men ostensibly accepting the teachings of Jesus? A peaceful life is well-nigh impossible to-day, and far more impossible to-day than in times gone by. Neither the poor, in their poverty, nor the rich, with all their wealth, can have much of anything else but anxieties, and excitements, and turmoils, and uncertainties right and left, in all forms and varieties. Many even declare that they don't want to live in any other way; they have even lost all capacity to enjoy peace; they have to be always running away from themselves. Neither the glories of nature nor the study of sciences and history have any great charms for them.

If, from the few who could have leisure, we pass to the many who cannot have it, what do we find among them? Suppose that before we investigate the above we try to formulate an estimate of the respective proportions of those who could have leisure if they only wanted to live a simple life, and those who cannot have it because of hard work and low earnings, but enough to cover, as an average, 50 per cent. of what sanitary conditions require. The latter may not be less than 95 per cent. of the race and the former not over 5 per cent. The exact proportions, God alone knows, and we don't need to know. Yet, any reasonable estimate shall answer all practical purposes.

Now, it is unquestionable that the wealth of nations is produced by the 95 per cent. who have no leisure and retain but a relatively small fragment of the wealth they produce. Why? Simply because of absence of equity in the social organization among the people, the ones who, alone, make that organization possible; and it is the people that the Lord shall judge with equity. Hence, God means that equity should prevail among the people. Can we have any doubts on the subject and yet retain any clear perceptions of God's infinite beauty?

And what about the world which is to be judged with righteousness? The world—the men who could have worked for righteousness and did not; also those who have taught that righteousness is impossible on earth for long periods, anyhow; also those who be-

lieve that and have had time and means to learn better than that, because of sufficient material resources without the labor that exhausts and develops not. Evidently, God means to make the world responsible for the absence of righteousness on earth, since the groups of people above indicated have done their best to prevent the establishment of righteousness, consciously or unconsciously, to be sure. We have nothing to do with that; we are simply forced to deal with general results in order to awaken up the dormant conscience of humanity and thus evolve from the rank and file of nations, the noblest tendencies that God has implanted in all men.

Yes, God means that equity should prevail among the people, but he also means that the people should work for it. The few, the world, can never establish righteousness. The many, alone, can. The many, alone shall; and the many are the people. The few could, and should, have long ago taught the people how to evolve correct civilizations, but they have neglected their duty on the subject.

That they may be perfect in one, was Christ's last prayer. That the people, the many, not the few alone, may be perfect through unity in all fundamental truth. That the social organization may be perfect through laws of equity, suppressing all political and industrial monopolies, making all wholesale gambling processes unprofitable, restoring to all men God's patrimony to them all—land worth having—and so the right of free production and free exchange; thus giving wealth to all, leisure to all, joy and manhood to all, forever vanishing from the human mind the blasphemous conception that God means this world to be a torture-shop for most of his children, as we, ourselves, have made it by impoverishing the many for the benefit of the few.

Now, let us return to our definition of equity: "The moral law applied to our personal and social relations." Every one of us has, therefore, two sets of duties; duties to those with whom we come in contact, and duties to all the citizens of our nation, and to all the citizens of humanity. When we learn how to fulfill that double set of duties, then, and then alone, shall the Kingdom of Heaven be at hand. To expect the healthy growth of individuals or family groups, while abandoning the nation to all laws of sin, that is simply trying to bake good loaves of bread in an oven wretchedly fixed up.

God owes to Himself the logic of his own creation, and to trifle with God's logic is to trifle with God's love. If from the concrete written revelations, we pass to the abstract ones in the universe, we find that all is there a question of divine art, and that universe includes man. What would be the universe without man, without the created intelligence? Now take philosophy and poetry, apparently so far from each other. Poetry is the divine art in forms, and that art fills up the whole universe. Philosophy is the divine art in principles; principles conducive to the joy of all created intelligence. Suppose the latter beginning in the naked savage, half demon, half man; well, that

being has the potentiality of growth, painful, if you like, because rebellious to divine law; and for 6,000 years, for 60,000 perhaps, we have had, through civilization, all imaginable forms of the demon and the savage. First, we had wars of conquest, carried on with greater or less barbarism; then we had a combination of conquest and religious wars, the most barbarous of all. Lately we have principally been having industrial wars, by far the most criminal and fatal, because it is under them that we have produced the greatest disequilibrium of wealth between the workers and the legalized gamblers.

Of course each period has evolved its heroes and sages, its martyrs and saints, as if to show the great potentiality of human development; but that is a very poor substitute for the absence of the normal man because of a wretched social organism. All in the universe, outside of men, strive for perfection and attain it. The same shall happen with us as soon as we stop our insane work for the mere civilization of the animal man, and begin the civilization of the human soul, by respecting all moral and ethical law, and so, the glorious philosophy of Jesus. And that must be the aim of the coming civilization.

[To be Continued.]

---

## MR. STUART'S SINGLE TAX FALLACIES.

BY JAMES MIDDLETON.

In accordance with the wish of Mr. Stuart, and by courtesy of the editor of the MAGAZINE, I shall review some of the objections to the Single Tax, from the standpoint of one who believes that in the present condition of society it is the best method of raising public revenues.

I shall give special attention to Mr. Stuart's criticisms, not with the vain desire to glorify an "ism," but with an earnest wish to seek the truth and to awaken thought and interest in what I believe to be a great, practical, and needed reform; a reform which is destined to make one of the great steps of social advancement.

For some two hundred years, since John Locke, one of England's greatest philosophers, advocated the raising of public revenues from the rents of lands, it has been, at different times, advocated and opposed with great ability on both sides. After Locke's time, the most conspicuous advocates up to our time were the Physiocrats of France, of whom Quesney, Gournai and Turgot were the chiefs.

Locke advocated it as the best method for the landlords, even, which would, perhaps, be true as regards improved lands; Turgot, as the best means of raising revenues, and, at the same time, as the

best method of freeing the working classes from the unjust burdens of taxation under which they were being crushed.

The Physiocratic theory was based upon the net product of agricultural lands, and when that theory was discarded it was supposed the *Impôt Unique* was overthrown.

Adam Smith advocated a special tax on ground rents of cities, but Ricardo claimed that it would be unjust, a singling out of a class and an attack upon the sacred (?) rights of property. But Ricardo developed the now celebrated Ricardian theory, which proved in the hands of Thomas Chalmers, Henry George and others, the basis of re-establishing the single tax, to which Mr. George has added the land monopoly theory.

Defenders of things as they are, seeing the trend of the Ricardian theory, have in many instances attacked it viciously. Anarchists, opposing all taxation, have, and perhaps consistently, opposed the single tax theory. Socialists, with an undue interest in an "ism," have bitterly, but not wisely, as it seems to me, fought the single tax. I say unwisely, for it seems to me that the unlimited single tax is a direct road to state socialism. George, himself, has shown that whoever controls the land absolutely, controls all. Then, if society should, as would be necessary under the single tax unlimited, control the land absolutely, it would control all as it wished. What more could state socialists ask? Others, I fancy, attack the system simply for the pleasure of disagreeing.

In spite of all attacks; in spite of undue claims of its devotees sometimes put forth; in spite of the weakness of some of the arguments they sometimes offer, faults into which, perhaps, its greatest living advocate, Henry George, himself, may sometimes fall; in spite of all, it is to-day believed in more widely than ever before as the most just system of taxation for the present constitution of society, for all worthy classes, whether rich or poor.

I am pleased that Mr. Stuart is to discuss the subject even adversely. Though he may not offer anything new yet what he offers will be forcibly put and well worth consideration.

In the first article which is before me, he but opens the subject. I shall await with great interest the development of his criticisms. In his opening, he has failed to distinguish between the Single Tax limited and unlimited.

As a single Taxer, as well as student, I do not believe all rent is robbery.

He assumes that all rent is robbery. He says that capital "in the hands of capitalists merely represents accumulated, unpaid labor." This is a mere assumption which demands proof. How about wage workers who have saved?

As regards interest, can he prove that it is unjust, if it arises from an absolutely free contract profitable alike to both?

I agree with him, and disagree with Mill and George, when he says: "The title to land (in this country at least) rests upon as equitable a basis as any other form of wealth." The Single Tax limited is in perfect harmony with that principle.

He assumes, that, under the system, owners of "stocks" would go untaxed. That is an assumption which demands proof. Owners of stocks, bonds and mortgages, based upon land values or franchises, under a just carrying out of the system, would be treated as joint owners of the land or franchises with the mortgagors, or holders. How then, would they escape taxation?

The elimination of any one class of exploiters may not solve the "economic problem" but it may be a long and necessary step in advance. Such I believe the tax on land values.

I know of but one panacea for social ills, and that is the elimination of ignorant selfishness and unscrupulous greed in the individual.

Without the moral intellectual elevation of the individual, the most perfect form of government might prove the worst form of exploitation and ruin.

---

## EPISODES OF 1848.

---

BY MARIE LOUISE.

No. 3.

[Concluded.]

"The fifty men on whom fell their wrath had, perhaps, not committed atrocities on the people. Their uniform was their only indictment. But, Etienne, the most horrible of all, was to compel them to pass bareheaded before the hostile multitude. Under such a penalty their manly dignity was crushed, their moral feelings were strangled! They marched unmanned, humiliated and degraded publicly. Physical injuries may cicatrize, and heal, but the mental ones remain gaping and bleeding forever! A man wounded on the battle field dies with a smile of satisfaction on his lips, but a man wounded in his honor and human dignity dies gnashing his teeth and cursing all the world!"

"I felt the distress of their situation," said Etienne anxiously, "but the people acted in retaliation."

"Aye, Etienne!" exclaimed Arnold vehemently, "*retaliation is evil perpetuated*. The cruelty enacted on the Guards may have been the result of their own cruelties on the people. But that result, transformed into a cause, has engendered the terrible carnage of to-day at the Palais Royal, where not only Municipal Guards but also troops of the line and also our own comrades taken prisoners have perished in the awful hecatomb! Who knows what the *retaliation* of this last horror will be to-morrow?"

"Arnold," said Etienne, "you are getting unwisely emotional. In the combat you are a lion of courage and strength, but when out of

action you permit an undue sensitiveness to hover over your spirit. Your mind is still under the charm of the philosophy your Lady friend of the Jura has whispered to you on the day of your departure. No doubt she was a correct thinker, but she never beheld thousands of bayonets crossed on the breasts of a famished people. Had she witnessed the scenes enacted in Paris these last three days the ground of her philosophy might have slid somewhat."

"She never saw, it is true, an insurrection of the people," rejoined Arnold, "but her life has been an epitome of human misery. Whilst she did not see bayonets crossed on the breast of the people, she did feel the dagger in the hands of the minions of Tyranny. Her battle field for being narrowed was not less perilous and the action less fierce. When I took leave of her I was skeptic as to the transcendental importance of mercy and love in human relations. But every day the fortress of my skepticism is battered by the conclusions of my experience."

"That line of philosophy," remarked Etienne, "resumes to this: '*render good for evil*'—'*love your enemies*.' But it possesses the serious defect of clashing with the law of cause and effect."

"By no means," retorted Arnold. "Is not the impulse to forgive, *i. e.*, *render good for evil*, also the effect of a predominant cause? Is it not the outcome of individual happiness being grounded on conferring pleasure and sparing pain?"

"I wish mutual forbearance and love were the undercurrent of all social relations," said Etienne with a sigh, "but it is not, and never will be until social equity is established. So long as oppressors and oppressed walk side by side, so long will retaliation hold the fort and *mauve qui pent!*"

"I admit the cogency of your remark," replied Arnold. "We live under oppression, and I know it. Therefore I am ready to shoulder the gun again and repel force by force, because that mode of repulsion, just now, is inevitable, and will be so until tyranny disintegrate and permit mercy and love to ooze in through its relaxed tissues."

"I accept all your conclusions, Arnold," said Arago, "and I join in all your desires."

"It is my happiness to know that you do," rejoined Arnold, "but let me appeal to you, the great, honored and respected leader of men, to bear in mind that ignominy and public humiliation furrow the human conscience so deeply that it never recovers its integrity. The convict who is dishonored by being branded with a red hot iron carries the ugly scar also on his heart, and gall suppurates from it incessantly. In the burning pangs of his humiliation the crime for which he has been convicted sinks into oblivion, whilst wrath and despair gnaw at his conscience and unhumanize him. Punishment solidifies crime."

"There is no denying that," said Etienne, pensively, "The person of man ought to be sacred:"

"Thoughtless men alone can overlook this phase of human life," continued Arnold, "for to an observing mind the fact is obvious. I

shall never forget those fifty Municipal Guards of yesterday, plodding along in single order amid the whipping anger of the crowd, stripped of all their arms and bare-headed; pushed, tossed and kicked; their two arms hanging dejectedly by their sides; their faces alternately flushed and ghastly pale; their bearing the very picture of humiliation and despair! I still fancy to hear the trembling voice of Lieutenant Bouvier as he muttered through his chattering teeth and clinging fast on your arm: 'To die!—to die torn to pieces!' This cry of anguish pierced my heart, and but for your noble and courageous words of comfort to him, which in their radiant devotion overspread and screened the horrors of the scene, my hope for human redemption might have faltered! Do you imagine that if Lieutenant Bouvier was to-day in the post of the Palais Royal he would have surrendered again to the people? Not at all. He and his men would fight until they die in combat. Did not you hear all the parleyers say that the troops of the line were willing to lay down their arms, but the Municipal Guards would not listen to any terms? Their efforts to kill all and be killed were desperate! The holocaust was consummated—none survived!"

"All this is very painful," remarked Etienne, throwing away the stump of his cigar and leaning his head on his hand. "Of what avail was our perilous action of yesterday? It was a mistake at best."

"No! no!" exclaimed Arnold, "your heroic conduct and warm sympathy speak louder than the disasters which have attended on the occurrence. Your deed of love yesterday is the beacon which towers aloft in the midst of foaming waves in the sea. It is a glimmer of the great sun which slowly but steadily warms the embryo into maturity, which, in the future, must emancipate mankind from evil and pain!"

"The people have burst open the door and invaded the Assembly!" shouted a man as he rushed into the restaurant.

"They cry for dissolution and the election of a Provisional Government. Such a confusion you never saw! The President has run away and the armed insurgents sit and stand on the benches of, as they say, the *purchased* Deputies!"

"Let us hasten to the Assembly," said Arnold grasping his musket and loading it, "Your name, Etienne, will pacify the people and silence Odillon Barrot if he try to play at royalty again!"

"Let us run in all speed," replied Etienne Arago, "I will die before another king grins his wily smile on the people of France! *Vive la Republique!*" he shouted as he dashed out with his friend and companion.

"*Vive la Republique Democratique et Sociale!*" yelled Arnold on the street, waving his hat in one hand and his musket with the other—"Mort aux rois!" (Death to kings.)

When they entered the Chamber, Dupont de l'Eure had just been successful in taking the President's chair and establishing a comparative degree of order among the excited and smoke-begrimed populace. The President and the majority of the Deputies had disappeared

and National Guards and people constituted themselves legislators.

"A Provisional Government is proposed to you," cried the temporary President, Dupont de l'Eure.

"Yes, yes, silence!" cried the non-silent crowd.

"Here are the names," again cried Dupont de l'Eure. "François Arago, Lamartine, Garnier Pages, Marie Creméux, Ledru Rollin, Dupont de l'Eure."

"Those who are against them hold up their hands," cried Deputy Ledru Rollin. ["No, no, yes, yes."] "If you will allow me, gentlemen, I will add another word. The Provisional Government which has just been named has great and immense duties to fulfill. We must close this sitting and go to the seat of government, and there take the necessary measures to stop the effusion of blood and secure the consecration of the people's rights."

"Numerous voices—"Yes, yes, to the Hotel de Ville."

The crowd in the Chamber began to diminish; all were running to the Hotel de Ville, to install the Provisional Government in their office.

"Let us go and pay a complimentary visit to the Tuilleries," said Etienne Arago, "to-day all visitors are admitted."

"Specially those in full dress," remarked Arnold, laughing. "Since three days we have danced with the cannon music; we are all dressed and equipped for the ball."

"Louis Phillippe and his family danced a *chahut* (can-can) to-day and so kicked up their legs that they flew out of the Tuilleries—you see, dancing was contagious," added Etienne laughing to split his ribs.

They entered the Tuilleries by the great staircase. Everywhere, on the floor and walls and mirrors, the people had written with chalk: "*A bas Louis Phillippe! Vive la Republique!*"

The elegant theatre was filled with the armed mob. Young men and boys sang, danced and gambolled on the stage, to the great merriment of the crowd. In the Chapel but few entered, and those who did took off their hats.

"Slavery is not yet out of them," whispered Arnold, "see them honoring images. There is still a place in their hearts where Monarchy may bury its claws!"

"But observe how few enter," rejoined Etienne, "all the others pass on unconcerned. Let us go and sign our names in Louis Phillippe's Register, and after, we will run to the Hotel de Ville."

The large book in which visitors to the royal family inscribed their names lay open. Etienne Arago and Arnold de Verchères added their own names to those of the obsequious courtiers who used to come and kneel before royalty.

"We are just a wee bit late," said Etienne humorously, "their Majesties went out for a drive."

"May they drive forever!" ejaculated Arnold in real earnest, whereat Etienne burst into a boisterous laughter and cried, "Amen! amen!—get up!" he continued, pretending to hold the bridle and whip the

horse, at the same time motioning the shake of a rolling carriage—  
 "Get up, Billy!—*gallopons allons vite!*—get up!"

"*Espèce de méridional timbré,*" (you crazy southerner) exclaimed Arnold—" *espèce de singe!* (you monkey.)"

"It is not every day that we send a King out for a long drive," replied Etienne, his eyes beaming with hilarity and malice.

"Let us go to the Hotel de Ville, Etienne," said Arnold, "I feel that you are wanted there."

As they entered the Hotel Ferdinand Flocon ran to meet them.

"Etienne," he said, "we were looking for you everywhere. Run to the General Postoffice, turn out the Director Dejean, and in the name of the Republic take his place. Hurry up, Etienne; all the mails must start to-night as usual at seven o'clock, or rivers of blood will be shed; the Province is rising in arms everywhere!"

"*The mails will all start to-night,*" answered Etienne, "even though hundreds of barricades stand between the postoffice and the Barriers. The mails will all start at seven o'clock."

A few minutes later he entered the court yard of the General Postoffice. Many National Guards were collected there, but when he announced his mission the ranks opened before him. He immediately entered the office of Count Dejean, the Director, and said:

"In the name of the Republic, citizen Dejean, you are dismissed. In the name of the Republic I come to replace you in the functions of the Director of the Postoffice."

"But, Monsieur," said Dejean, standing up, "have you a commission—a title?"

"I have nothing but my word."

"But, Monsieur, I"—

"I have my word, and my name is Etienne Arago."

"But," said M. Dejean, after a moment silence and hesitation, "before I quit the direction of the Postoffice I must request that you will give me your signature and that some document may remain in the archives."

"Willingly," replied Etienne, seating himself in the arm-chair of M. Dejean. And he wrote his name at the bottom of a few lines containing the dismissal of M. Dejean and his own appointment.

"I have made a fault in grammar, I see, in reading over the lines, rather a grave fault for a literary man, but," he added, smiling, "one may be excused writing bad French when one has just been fighting like a good Frenchman."

"Now, Monsieur," said the ex-Director, before retiring, "I have a request to make; one of my relatives, an elderly lady, is alone in the neighboring apartment. May I hope,"—

"Sir," said Etienne, rising and speaking in the tone of a most exquisite politeness, "Madame, your relative is under my *sauvegarde*; I answer for her safety, and that of all in the hotel, with my head."

M. Dejean bowed his thanks and retired from his cabinet.

Etienne Arago immediately summoned all the superior officers and said:

"Gentlemen, every one of the mails must start this evening."

The employes looked at each other with an air of perfect stupefaction.

"The mails would start to-night," they replied, "but M. Dejean announced himself in the Chamber that no letter would go."

"That was said during the existence of the Monarchy, and we are now under Republican system."

"But there are more than two hundred barricades between them and the Barriers. Monsieur, what you wish is impossible."

"We have proved to-day that nothing is impossible," said Etienne Arago warmly. "The three days of February have changed affairs. If to-morrow, at the accustomed hour, newspapers, letters and dispatches do not arrive in the *Départments*, there will be oceans of blood shed all over France and the responsibility of this blood would rest on my head. Every mail must go, then, to-night. The packages must be carried on men's backs over the barricades to the barriers, and if it be necessary I will carry the first packet."

Taking up a pen he wrote to the Provisional Government:

"*Citoyens gouvernants*, the service of the Postoffice will take place to-night as usual."

At seven o'clock all the *malles postées* were dashing along the roads with tricolor flags waving on their summits and bearing the dispatches which were to announce to all France the downfall of the Monarchy and the establishment of a Republic.

In many parts of France blood had commenced to flow; the provinces had long been waiting for a signal from Paris to raise in insurrection. The timely announcement of the victory won by the people in the capitol, however, turned the excitement and terror of a civil war into gladness and rejoicing.

Of all the marvelous exploits performed during the memorable days of February 22-23-24, 1848, are there any which surpass those of Etienne Arago in greatness, courage, bold expediency and energetic decision?

---

## SINGLE TAX FALLACIES.

BY W. H. STUART.

No. 2.

How would security of tenure of land and improvements be affected by the adoption of single-tax?

It is everywhere asserted in single-tax literature that the one thing that will continue to increase as wealth and population increases, is land values. Indeed, Henry George sees in this constantly increasing value, that can—in the shape of rent—be drawn upon, and that

will keep pace with the increasing needs of the community, a self-evident provision of divine wisdom. This constant increase in rental values will continue, so it is claimed, undiminished, under the single-tax; the only difference being, that this increase in the value of land, which is now absorbed by private individuals, will then, in the shape of rent, accrue to the whole community.

It is admitted that absolute security for improvements is necessary to insure the best use of the land. "What is necessary," says Henry George, in "Progress and Poverty," "for the use of land is not its private ownership, but the security for improvements. It is not necessary to say to a man 'this land is yours,' in order to induce him to cultivate and improve it; it is only necessary to say: 'Whatever your labor or capital produces on this land shall be yours. \* \* \* The ownership of the land has nothing to do with it.'" And it is further on pointed out that some of the most costly buildings in London and New York are located on leased ground. It is quite true that a large number of buildings in London are upon leased ground, owned by the Duke of Westminster and others. Hundreds of these leases, however, that recently expired, were for terms of ninety-nine years, and it is unusual for leases on real estate in London to be drawn for a less period than twenty-one years. That is, the land is leased for a fixed period of time and for a fixed annual rent. Does the single-tax offer equal security for possession of land and improvements? This question must, I think, be answered in the negative. Rental values are, under the single tax *regime*, to be assessed and collected as present taxes are assessed and collected, *i. e.*, annually or biennially. "No new machinery," Mr. George informs us, "will be necessary. The machinery already exists. We already take some rent in taxation; we have only to make some changes in our modes of taxation to take it all."

Let us see how this might work. We will imagine the single-tax in effect. Farmer Jones takes up land near a growing town; he builds a comfortable farm house, capacious barns and out-buildings, fences his land and drains it, and is, after some years of unremitting toil, beginning to reap the fruits of his labors. The neighboring town is growing rapidly and spreading out in his direction; a street car line is projected to run past his place, and one day the assessor drops in and informs him that his land is needed for suburban residences, factories, warehouses, etc., and that his "single"-tax will have to be doubled. Jones, of course, protests, but without avail, and his rent continues to increase until he can no longer pay it from the profits of agriculture, and his improvements being unsuitable for the new purposes for which his land is needed, he is forced to sacrifice and seek "fresh pastures" remote from the march of progress.

Or, take Smith, the mechanic. He took up a lot in town, the annual rent of which he felt able to pay, built himself a home (all the larger because he did not have to purchase the lot) and spent his spare time, for three or four years in adding improvements—a pretty garden, handsome fence, etc. Now, it is certain that Smith will look

with distrust on all improvements in his vicinity that will tend to increase his annual rent. He will dread the approach of business. But the town continued to grow, and in a few years a costly public building was erected near him, his lot became valuable for business purposes, his rent quadrupled and he was forced to move his home and abandon his thousand little improvements, taking care that his next location was in the most undesirable part of the town, remote from possible improvements and increase of rent.

This rapid increase in land values has been the invariable history of all growing towns. We have seen in this city (Los Angeles Cal.) lots increase in value, within fifteen years, from one, two and three thousand dollars each, to twenty, thirty and forty thousand each; or, to express it in terms of the single-tax, from a rental of one, two and three hundred dollars per annum, to two, three and four thousand dollars per annum. Indeed, we have near us an illustration of the rapid increase in land values frequently affected by even the location of a large building. The government has recently purchased, at a cost of \$1,040,000, a site in San Francisco, upon which it is expected a public building, to cost two or three millions, will be erected. The location of the site is in a part of the city occupied mostly by the homes of working people. The usual result has followed. Lots in the immediate vicinity of the site have increased enormously in value, and for blocks around, prices have doubled and quadrupled, to the great joy of the owners.

But how would these working people have been affected had the single tax been in effect? Would they not have regarded with consternation, the location of such a building in their midst? The government would have been appealed to. It would have been represented that the location of such a building in their midst would so enormously increase rental values as to force them to move or abandon their improvements, a misfortune, they would claim, they were unable to bear.

Is it not evident that if Mr. George's theory of the continuous increase in land value is correct, that security of tenure, under a single tax *regime*, would be impossible. Improvements adequate for a town of 10,000 population would be inadequate, both in size and architecture, when population had doubled or quadrupled, and as such increase in population is frequently effected in less than a decade, and as rental value would increase quite regardless of the income from the improvements, they would be compelled to tear them down and erect others, from which a larger income could be derived, or abandon them, in either case at a great loss to the owners.

Under such insecurity of tenure, no poor man would dare to build a home in a growing town; only the rich could afford to take the risk of erecting small buildings, and they, it may confidently be expected, would recoup themselves in increased rent.

An elderly friend of mine, a baker by trade, was fond of telling that in his younger days, he was offered the site now occupied by the Sherman House, in Chicago, for a few months work at his trade.

He looked the ground over carefully—he was speculatively disposed—but declined the offer, seeing nothing in the possible future of the “windy city” to justify the investment. He lived to see land that he had refused to purchase at the rate of some hundreds of dollars per acre, increase in value to as many millions. And I again ask: How would security of tenure be affected by the adoption of the single tax?

---

## AUNTIE'S ROMANCE.

BY FRANK A. MYERS.

---

“Auntie, I have heard you had a real romance in your early life. Please tell it to me, now that we are all alone this evening. I want to hear it.”

There was a few moments of silence after this request by Katie. Auntie bowed her head a little nearer the work in her lap. Katie felt as if she had made a mistake in the request and had caused Auntie unnecessary pain by bringing up the sad memories of the days when she was a young girl. The old petroleum lamp seemed to flicker in sympathy to the stirring emotions of Auntie's soul. The shadows in the corners of the old-fashioned room apparently deepened, and Katie was impressed with a feeling of awe and dread. She leaned nearer to the light and to Auntie as if for protection. The autumn winds soughed mournfully through the cypress trees around the old log house, and fear brought the reality of life and the dread outer world more oppressively close to Katie.

The brooding silence made Katie wish she had not asked Auntie to tell her romance. A strange feeling, like the forebodings of some evil to herself or the presence of some calamity she could not shun, permeated her heart and mind, and she almost cringed at the feet of Auntie as if to implore protection.

Auntie looked up from her work after the short period of silence, and with a mournful voice that almost echoed the long ago, said deliberately:

“Life has its tragedies of the heart, Katie, as well as of the person.”

“Auntie, I feel now like accusing myself for suggesting this. I'm inclined to think your romance is a sad one. Indeed, I had heard it is, but I asked for it thoughtlessly, and if you would rather not tell it, I shall be satisfied.”

“I do not tell it often. It is a sad one. The people point to me, and pity my long and sorrowful life. Everybody knows that I never married, and why I have not. I am glad you spoke of this to-night.

I was thinking of my early happy days, and felt sad and lonely. While my story is a sad one, yet I always felt better after telling it."

Katie brightened up, and a comforting smile removed the pained look on her face.

"Your words make me feel better."

The thoughts in Auntie's mind caused a tear to moisten her wrinkled cheek.

Ellen Newman was sixty-three years old. Her face was wrinkled, and her body was slightly bowed when she walked. She wore a white, lace-trimmed cap on her head, and her dress was plain and old-styled. Few knew the particulars of her early romance, but everybody said that devotion to the dead was the reason she never married.

She lived in an old log house on the hill, along the side of which the trains rolled and thundered every day and every night. They were a death-knell in her ears, and yet she could not bear to dwell anywhere else. She lived alone.

Katie King was her sister's daughter, and was only sixteen years old. Katie's home was in the city, and her beauty brought her many admirers. She was now spending the fall with her Aunt Ellen, simply as a visitor.

She had often heard that the reason her aunt never married was because of a romance she had in her youth. It was said that she was faithful to the memory of him whom she first loved and promised to wed.

Auntie dropped her work in her lap, and pointing past the lamp with her long index finger, said:

"That great mouth of the railroad tunnel up there, just in sight from the front door, I never shall forget. Just there the tragedy occurred, years, long years ago, when I was a young girl flushed with the glowing hope of a happy life.

"It was a soft summer evening that he came to see me. I watched his coming up the hill. He was young and handsome and manly, and full of life and promise. We sat long on the front porch, and the sweetest words man ever uttered he told me. I know he meant them all."

"What was his name, Auntie?"

"Martin Dunbar, my child. God bless you, his love was greater and purer than the love of the young man now. It was different. There was manhood in his words. He said he loved me as never man loved woman before. And I know he did. Our love was like the great sun at noonday. The earth held nothing so grand and sweet as Martin. He was entirely above trifling with me and above deceit. He said to me:

"Ellen, I love you."

"That was the sweetest remark ever poured into woman's ears. I told him I believed him, and that I loved him more than my life. When a woman loves a good man, my dear girl, she loves with no common love. Then he asked me to marry him, and I—I—I said

I would. O, how happy I was! The very earth seemed to be better. The stars shone brighter than they ever have since. The air breathed sweet songs of love, and heaven touched my very soul. I knew nothing but love and Martin. I did not want to know anything else. The garnered fullness of the earth was all for me—for me."

Auntie paused. A light of other days illumined her wrinkled face. Even Katie felt a glow of her enthusiasm. The winds that soughed around the corners of the house and rustled through the cypress trees bore a song of gladness. Katie's fears had gone completely.

"We were to be married in six months. When he left me that night, he kissed me good night, and said I was his forever. He said he never was happier in his life, and I know I never was.

"I stood and listened to his step down the hill side after he had disappeared in the darkness. The emotions of my soul can never be expressed in words. Pure happiness cannot be told. The spirit soars into realms that are above the coarseness of words. His sweet words echoed in my heart like silver bells of gladness, and called me to ethereal pleasures that, alas! never came to me any more. The joys of those days—of that hour—have gone out in the shadows of a night that came like a shocking whirlwind. They will never, never come to me again! Night set in then, and the bright sun of my first true happiness sank out of sight at once and forever—forever!"

"O, Auntie, how you talk!" exclaimed Katie shudderingly. There was not a tear in Auntie's eyes. On the contrary, they glowed like pearls, in their unwonted activity. She lived over again the past as she recalled it from memory, and the one thing that had forever palsied her happiness in her early girlhood now inspired her every word and look.

"I stood there on the porch in the darkness leaning against a post. The joys of my promised new life passed in review before me as I thought and dreamed. I was perfectly happy. My intended had just left me, and I wondered whether anybody was ever as happy as I was. But my happiness went out as suddenly as would that light should you blow it out. The darkness of despair came as suddenly as a flash, and everything faded in a moment—everything! My joys all perished at a blow and left me forlorn and unhappy forever. Nothing under the sun could restore them! Night had set in forever in this world for me! All that I held dear vanished in an instant, and the blackness of darkness was mine forever!

"I saw the headlight of the train as it came out of the tunnel. I heard the loud roar of the train and listened to its echoes from the hillside and across the valley in the darkness of the stilly summer night. It bore a message of peace to me as I stood silently on the porch in the darkness. The headlight trembled as it approached, and grew larger each moment like a timid will-o'-the-wisp. The rumble and roar became louder each moment of time, and the very earth trembled under the heavy rolling wheels."

At this moment there was a shrill scream without and near. Katie exclaimed in surprise and fear:

"What was that, Auntie?"

"That was only the night owl, my dear—nothing to be afraid of. But how curious," she resumed, after a slight pause of breathless silence, "that it should scream just at this part of my story. It sounded almost like the shrill scream of the train, as I stood there on that awful night looking at the weird monster approaching through the darkness, of which only the glimmering headlight could be seen distinctly.

"Just here, as I was going to say, the train gave one unearthly scream that roared down the valley and echoed from the woods and hills. It pierced me with fear like the terrorizing scream of some nameless brute from the infernal regions. The one sharp, short, awful scream from the throat of that puffing and roaring giant meant danger and 'down brakes.' In a moment the fearful screech was heard again. In a few minutes the train stopped just down here in front of the house. Then I saw the train men moving about with lanterns. The roar and echo of the moving cars had ceased, and the brooding stillness now was like the messenger of something awful. The darkness of the night oppressed me, and I realized that I was alone and peering forth for something, I knew not what. An impression possessed me like an evil spirit that something terrible had happened. I could not conceive what. I felt that if I could push the darkness away I might see what had stopped the train. But I stood as one fettered to the post, awaiting the disclosure of something I knew not what. I felt that there was something wrong, or the train would not have stopped in that tragic manner.

"Who can describe the feelings in suspense?" Who can tell the agitations of an anxious and expectant heart? Who can depict the sensibility of an eager and awaiting soul? Who can describe the state between earnest desire and conscious fact? Who can paint the glow and heat of a heart made trebly sensitive and alive by some unwonted incident? Who can depict the emotions and feelings of a conscious being when under excitement? The half cannot be told. The heart refused to speak. Under the chill of an indescribable fear it is dumb. The very echoes of conscious existence appall. The tumult of a heart full of love and fear is like the tossings of the ocean beneath the strong wind that threatens the safety of the vessel floating on its bosom.

"Love—love—he told me that he loved me!" exclaimed Auntie, rhapsodically. "He said he would be faithful until death. I promised him I would be his forever. O, how sweet were those moments of pure and fervent love! Martin was all the world to me—the joy, the glory, the sum of life! His voice was as a heavenly song. His presence was as Paradise. His words of love were as the essence of the perfect happiness hoped for by the blessed. His kiss was sweeter than the exalted joys of the angels. Alas! alas!"

Overcome by her emotions, Auntie paused and put her hands over

her face and bowed over to her knees. In that position she remained a few moments, and then, recollecting herself, she brushed away her tears and mournfully continued:

"O, yes—the lights. Well, I saw them after awhile coming up the walk leading to the house from the railroad. Their lanterns twinkled like meteors of the night. The heavy tread of feet came up the walk, and in some unaccountable way fell on my ears like the knell of death. I was torn as a forest in a storm between my conflicting emotions of happiness and dread.

"When they approached nearer I could see that they were bearing something. It was very, very strange for railroad men to stop the train and carry something to the house in this manner late at night. I never heard of the like before. Trains travel too fast to do this sort of thing for diversion. I concluded it must be something awful. One of the men approached with his lantern, while the rest stopped inside of the gate, fifty yards away. Their voices were low and solemn. The man who came up appeared startled when he saw me at the post. The rays of his lantern enveloped him in a weird circle of light, bounded by the terrifying darkness around. He paused before me and said in his rude and reserved way:

"'We run over a man down there, and we carried him inside the gate.'

"Great God! could it be Martin?" That was my first thought. I stammered out:

"'Who is it?'

"'He was tryin' to git on the train an' fell under the wheels. Poor fellow! They say it is—but I don't know him. He is terribly mangled up—all cut up—dead in a minute. They said, I believe, it was Martin Dunbar.'

"I screamed, and fell. I knew no more, until they told me Martin was buried. For a long, long time I lay betwixt life and death. The shock was awful. In one brief moment all the world became a desert to me. My heart was blasted. There was no star to guide me by night, no oasis to afford me a resting place across the boundless desert. The record of my life is nearly made up, Katie, and God knows best what afflictions are necessary for the heart. I loved Martin too well."

Auntie sobbed until her very frame quivered with emotion. The breaking forth of her pent-up sorrow seemed to do her good. It was a sort of dead sea, that swallowed up the Gomorrah of her heart.

Katie was sobbing as if her young and tender and susceptible heart would break. Auntie's sorrow was hers for the moment. The two women, one whose heart was as the written page, and the other, whose budding nature was fresh as the bloom of the morning rose, mingled their tears in one common sorrow—made so in Katie's case by the possession of the facts.

There was no one to molest them. The sad autumn winds whisped through the cypress trees like the unintelligible talk of friendly angels. The owl had flown across the field to the woods, and now

his melancholy hoot came gently upon their unheeding ears. The darkness of the night was kept out of the little room by the light on the broad table.

After awhile Katie got up and walked across the rag-carpeted floor to the old-fashioned clock on the mantel. She paused before it, her feelings partaking of a strange and inexplicable terror. Without any allusion to the sad romance of Auntie, she said:

"It is ten o'clock, Auntie, and we should go to bed."

---

## SHALL THE PEOPLE OWN THE RAILROADS?

---

BY JAMES L. EDWARDS.

I am not a little interested in the articles written by Cyrus Field Willard, labor editor of the *Boston Globe*, captioned "Shall the People Own the Railroads, or?"

According to the interstate commerce commission, there were 168,402 miles of single track railroad in the United States, June 30, 1891. During the year ending June 30, 1891, the increase of track mileage was 4,805 miles. If the same rate of increase has been kept up since that date to January 1, 1893—one year and a half—the total mileage would be 175,609 miles, and including double track, it would be safe to say that on January 1, 1893, the railroads of the United States would be 176,000 miles.

We are told by the same high authority that the 168,402 miles of railroad are valued at \$9,829,475,015, or \$60,942 per mile. If, therefore, we add 7,207 miles of road built between June 30, 1891, and January 1, 1893—one and a half years—we have 175,609 miles, and by adding 391 miles for double track, the sum total, as I have stated, would be, in round numbers, 176,000 miles, which at \$60,942 per mile, would swell the sum total of value to \$10,646,192,000.

Mr. Willard asks, "Shall the People own the Railroads or?" "Or," what? I suppose, "or" not.

If the people should "own the railroads," I suppose Mr. Willard's idea is, that the people should purchase them. I can see no other way for the people to obtain possession of them.

If the people, that is, the government, should propose to buy the railroads, the question arises, how is the money to be raised with which to pay for them? The only way the people, that is, the government, can obtain money is to coin it, print it or borrow it. It is practically impossible to coin the required amount, \$10,646,192,000. It might be printed on paper, but if such a vast sum were printed it wouldn't be worth two cents on a dollar, and the owners of railroads would not receive it. Hence, that way of raising the money must

be dismissed. Could the people, that is, the government, raise \$10,646,192,000 by taxation? What would the government tax to enable it to purchase the railroads? Tax who? O, the people; only the people can be taxed; only labor pays taxes. Labor supplies all the revenues. Could the people pay the tax required to buy the railroads?

But, says some one, let the government issue bonds and sell them and raise the \$10,646,192,000 in that way, to purchase the railroads. If the government were to issue bonds to the amount required, no one having money, in all the world, would touch them. The mere proposition would be the death knell of the enterprise.

But, is there not still another way of getting at the matter? Couldn't the people elect a congress—house and senate—and a president, who, acting in concert, would pass a law to issue the bonds, and then compel the owners of railroads to accept them, worthless as they might be? Possibly, but that would be perpetrating a fraud of stupendous proportions. Would the people be likely to unify for such a purpose? Scarcely. If the people "shall" own the railroads, something must be done to pay for them.

The interstate commerce commission state that for the year ending June 30, 1891, the gross earnings of all the railroads amounted to \$1,096,761,395, and that the operating expenses were \$731,887,893, showing a difference of \$364,879,502. Suppose the government, that is, the people, should say to the owners of the roads: "We will take the roads and pay you, annually, the surplus earnings, in which case it will require about thirty years to liquidate the debt." In reply, the railroad owners might say, "All right, but in the meantime you must pay us interest on \$10,646,192,000, at 4 per cent. Here would come into prominence the fact that the interest on the debt would exceed the earnings, \$60,968,178; as a result, the people, that is, the government, instead of paying off the debt, would be going into debt annually, to the amount of \$60,968,178. As a result, the only way the people could own the railroads would be to confiscate them; order out the army and take possession of them. In that case the people would violate the constitution, the republic would disappear and an odious autocracy would take its place.

According to the statistics of the interstate commerce commission, there were employed on all of the railroads in the country, June 30, 1891, 784,285 men. I will assume that on January 1, 1893, the number of employes is 800,000. "As affecting the railroad men as a part," is it to be presumed that the people will load themselves down with a debt of \$10,646,192,000? Would the people, or the general public, as a whole, deem it prudent to enter upon such a scheme? At the mere suggestion the financiers of the world would stand aghast, and labor, in contemplating the burden thus imposed upon it, would throw up its hands and swear that its back was broken; because, as labor pays everything, like old Job, it would curse the day in which it was born, and sigh like a cyclone, for a return of Egyptian bondage when the Pharaohs built the pyramids.

Now, I recognize the greatness of the Brotherhood of Locomotive Firemen. I have trained with it on many occasions. It has largeness of soul. Its heart is great and throbs responsive to all liberal and philanthropic ideas. The members of the brotherhood, receive, on an average, about \$2.00 a day, which enables them, by the exercise of great economy, to barely make both ends meet, and I doubt if they would favor a scheme by which the government would load itself down with a debt of \$10,646,192,000 and an annual interest debt of \$425,847,680, for the great and blessed privilege of working for the government.

Taking Mr. Willard's view of governments, why should locomotive firemen or any other railroad employes want to work for the government, when Mr. Willard refers to the "shameless debaucheries of state and municipal governments, and yes, the national government itself?" Why should railroad employes desire to work for such debauched employers? Wouldn't these "shameless debaucheries" control the railroad service, since Mr. Willard confesses they taint everything else?

There are those who are the advocates of paternalism, the centralization of all power in governmental officials. It is the simplest form of government. The Czar of Russia isn't bothered with legislatures and congresses; when he wants anything he takes it. He fixes pay and hours of work; he owns everything, including the people. He assumes divine right to rule; the people, his subjects, have as many rights as beasts of burden—no more. Even in Germany, if a man, a subject, speaks his mind unfavorably of the emperor, he goes behind prison bars in spite of the Reichstag or courts, and already in this favored land the torture of Iams for indicating hostility to Frick, is held to be the right thing to do, and the shooting of a Pinkerton is held to be treason against the state, and yet there are those who would place all railroad employes in the grasp of the government.

The idea has been set forth that railroads should be operated as armies are managed; that men should be enlisted and uniformed and brought under military regulation, and if the government should own the railroads, what more probable; indeed, what more logical than that employes would be subjected to military discipline? And suppose a poor employe should be discharged, what would be his chances to obtain another job? From the moment of his discharge, he would be like Cain, a wanderer in the earth, until he could find employment somewhere where the government could not touch him.

Those who are familiar with government employment know full well the character of a government boss. Of all creatures, they are the most odious, and the smaller the boss the more arrogant and detestable they become.

But this paper is already too long, and still the subject is not exhausted, and, with the permission of the editor of the MAGAZINE, it may be further elaborated in succeeding issues.

## THE SPECULATIVE MARGIN, AND THE NATURAL PRICE OF LAND.

BY WILFRED P. BORLAND.

I had decided to pay no further attention to Mr. Ward's peculiar economic theories, but those later effusions of his contain some points which it seems necessary for me to note.

That is a very just remark of Mr. Ward's concerning the inaccuracy of many of the so-called economic laws, but he should not, therefore, allow his weakness for large and indiscriminate generalization to lead him into the error of including in the category of inaccurate laws, those self-evident truths upon which the science of political economy is founded.

Those laws to which Mr. Ward's criticism applies are secondary laws, or imperfect deductions from the primary principle; the primary laws of political economy are self-evident truths with which it were as idle to quarrel as with the law of gravitation.

There is a law of physics which says "motion follows the lines of least resistance;" this law was obtained by direct observation from nature; it is a law of nature which is never for a moment lost sight of in the practical operations of the science of physical dynamics.

In strict analogy with this law of physics, we have the primary law of political economy: "Men seek to gratify their wants with the least exertion." This law is obtained by direct observation of human nature; it has all the force of an axiom and must always be taken into consideration, and kept continually in view, while deducing those economic principles calculated to be given practical application. There are several economic laws which are obtained from this primary one by direct inference; that is, the mind instantly perceives their truth without being compelled to resort to the ordinary processes of reasoning; they flow so naturally from the primary law that their truth is instantly perceived, and it might, indeed, be said that they are but the statement in another form of the primary law.

The law of supply and demand is one of these; the law of rent another, and that so called "Gresham's law," to which Mr. Ward takes exception, is another. What is this "Gresham's law?" Why, it is merely the statement, in another form, of the primary principle of political economy. It is a mistake to call it "Gresham's law;" the law is as old as human nature itself; Gresham did not discover it, he merely formulated it, and applied it to monetary science. What does the law say? Why, it says merely that "a superior and an inferior currency cannot circulate together; the inferior will drive out the superior." What does this law mean? It means just this:

We will suppose a community which employs wheat as a medium for conducting its exchanges and paying its debts; we will suppose

that, by the exercise of its sovereign power, the government of this community declares that henceforth chaff shall be legally recognized as having the same power as wheat in all exchange transactions. What follows?

Why, if the intellectual perceptions of the members of the community lead them to attach a greater value to the wheat than to the chaff—a circumstance which we can easily imagine would be the case—they will make their exchange, and pay their debts with the chaff and keep the wheat. In other words, the inferior currency (determined always by the intellectual perceptions of the users) will drive the superior from circulation. The truth is self-evident; the members of the community are but obeying the dictates of that great principle of human nature, which is the fundamental law of political economy, and which says that “men seek to gratify their wants with the least exertion.” The law is indisputable, and Mr. Ward cannot produce a particle of evidence to show that it has been abrogated for a single instant, either in France or elsewhere. But what are we to deduce from this? Is it true, then, as the monetary scientists tell us, that the wheat is the only proper currency, and that in order to secure a proper exchange medium we must discard the chaff entirely? No, we need believe nothing of the kind. By a rational construction of the law, we get just this:

As soon as men shall have courage enough, and honesty enough, and good sense enough to do so, they may employ the chaff exclusively for the purpose of making their exchanges, and thus obey the method of nature by satisfying their wants with the least exertion. Herein lies all the error connected with the so called “Gresham’s law.” The error lies in its application, not in its truth; the truth of the law is unimpeachable; its application is a disgrace to humanity. Thus it is with those other primary laws; they have been distorted and twisted from their true intent, and by illogical and imperfect application, they have been made to serve the selfish instincts of the few while oppressing the many. Men who, like Mr. Ward, are incapable of distinguishing between the subjective and the objective, have all along supposed that their oppression issued from the laws, and have foolishly attempted to deny them, when, in truth, their oppression is the result of an imperfect application of the laws. When this truth shall be once fully recognized, then will the period of emancipation for the masses be near at hand.

It may be true, as Mr. Ward says, that there are very few single taxers who have the most remote idea about what the terms “speculative margin” and “economic rent” really mean, but so long as the statement rests wholly upon Mr. Ward’s unsupported assertion, I hope I may be permitted to doubt it.

I shall endeavor to explain the meaning of the term “speculative margin,” as used by single taxers, and in order that I may not incur the charge of using abstruse language, as well as to insure clearness of illustration, I shall employ the mechanical method and refer my readers to the annexed diagram:

The square bounded by the lines  $a$  represents an area of land sufficient in extent to supply the wants of a given community, and the natural margin of production rests at the lines  $a$ . The area represented by the square  $b$  is withheld from use; and, as the demand is for the whole of the area within the natural margin and the square  $b$  lies within this area, the supply of land sufficient for the wants of the given community is just to that extent restricted. The demand being for the whole of the area within the natural margin, and the supply being thus restricted, the community is necessarily forced to have recourse to land lying beyond the natural margin in order to supply its wants. An unnatural or "speculative margin" is thus created, which settles at the lines  $c$ .

The condition herein shown is precisely such as governs our land supply to-day; it is the condition we single taxers have in mind when we use the term "speculative margin," and I must insist that we know exactly what we mean, Mr. Ward to the contrary, notwithstanding. Now, let us reason a little upon this condition.

Every parcel of land within the lines  $a$  has a natural price; the amount of which price is estimated by the relative advantages of the land as compared with land situated at the natural margin. Now, by reason of the extension of the margin to the lines  $c$ , a new relation is established; the advantages which operate to give value to land are no longer estimated by comparison with land situated at the natural margin, but by comparison with land situated at the "speculative margin." An unnatural rent is thus created which we term "speculative rent," to distinguish it from rent proper, or rent arising by reason of the free operation of natural laws. Just how much of our land values are natural, and how much "speculative," it is impossible for any power short of omniscience to tell; the fact of the existence of the square  $b$  destroys the possibility of arriving at anything more than approximately correct conclusions. But, from our knowledge of the operation of the law of supply and demand, we are warranted in inferring that our land values are much greater than they would be if allowed to arise naturally. We are also warranted

in making the assertion that, providing the area represented by the square *b* is forced into use, the "speculative margin" will be destroyed, the margin would adjust itself naturally at the lines *a*, and the rent of all lands within the area bounded by these lines would adjust itself to the new relations and be correspondingly reduced. We may indicate our authority for arriving at this conclusion by means of an illustration, thus:

Here is a product—no matter what—call it wheat; there is enough to supply all the demands of the community, and if supply is allowed to adjust itself naturally to the demand, we are justified in saying that the price for wheat under these conditions is its natural price. But some "Old Hutch" is allowed to restrict the natural supply by withholding a portion of it from the market. Supply being thus rendered inadequate to the satisfaction of demand, the price of wheat immediately advances to an unnatural or speculative point, and we are now justified in saying that the price of wheat is a speculative price. This speculative price attaches to all the several grades of wheat; even supposing only the best grade has been withheld, the poorer grades advance in sympathy with it. Now, by forcing the supply of wheat which is thus withheld upon the market, the speculative price of wheat is at once destroyed and the price of all grades of wheat assumes the natural level. Now for a tangible illustration as connected with the land question: It is well known that the state of Michigan has been, and still is, a great lumber producing state. Not many years ago the pine supply was near at hand to the Saginaw Valley, and it became a great centre both for the manufacture and sale of lumber. But the area of land from which was derived the pine timber supply has been all the time receding, and the Saginaw Valley lumber manufacturers are now compelled to resort to the Upper Peninsula and the Georgian Bay district in order to secure timber to supply their mills. Situated in the Lower Peninsula, and convenient to the Saginaw Valley mills, is a vast tract of virgin pine, sufficient in extent to supply all the demands of the market for some years to come. This timber is owned by one of the millionaire lumbermen of the state; it was secured years ago at a small cost, and now, merely to gratify the whims or the greed of its owner, is withheld from use. The natural supply of pine for the Saginaw Valley district is, just to this extent, restricted, and the margin of production for pine timber is thus forced to settle in the Upper Peninsula and the Georgian Bay district, and thus becomes a "speculative margin." It can easily be imagined that the withholding of this land from use has the effect to increase the price of pine timber to a point above what it otherwise would be, not only of that which is withheld from use, and all other timber within the natural margin, but also of all timber lying in the area between the natural and the "speculative margin;" and it is a correct inference that if the timber spoken of is forced into use, the "speculative margin" will disappear and the price of pine timber in the Saginaw Valley market will be reduced to its natural level. Thus, the single taxpayer's definition of the term "speculative margin" is a logical deduction from the law of

supply and demand; we do not seek to deny any of the self-evident truths of political economy, either directly or by implication; we acknowledge the truth of all these primary laws, and insist that they be given perfect application. We say if the laws are good for the few they are also good for the many. Let them operate without restriction.

When Mr. Ward talks about the natural price of land as if it were a verity, he is talking foolishness. No man can tell what the natural price of land is. Natural price is a price which arises under the free operation of natural laws, and as the cause essential to the stated effect does not exist, the effect cannot exist. We are not justified in deducing natural effects from unnatural causes. The "*selling price of a Kansas or Texas farm*" (with the emphasis upon the *selling price*), bears about the same relation to its natural price as the quadrature of the circle does to actual fact. Mr. Ward imagines I do not understand his position, because, as he says, "he branches off into an argument concerning production and the cost of production." I have not the least doubt but my argument was "all Greek" to Mr. Ward, but will he kindly inform us how there can be any rent where there is no production? Can't you perceive the connection, Mr. Ward?

It is very evident that the terms "margin of production" and "natural price" are very foggy and poorly understood by Mr. Ward, at least, as is evidenced by his insisting upon leaving out of the question "any discussion as to production or its cost relatively in different locations." Why, Mr. Ward, to attempt a discussion of rent with the question of production left out, would be like attempting to play Hamlet with the ghost or Ophelia left out.

A person who is capable of asserting that the terms "margin of production" and "natural price" "have reference to a condition of affairs which have nothing to do with rent or the land question," is so poorly equipped for economic discussion as to render it almost a waste of time to pay any attention to him.

Mr. Ward's labored argument is all knocked in the head by his own admission that "all lands will become of the same value providing they will produce as much an acre." Eliminate the question of locality, if you wish; how are you going to eliminate rent from land which produces twice as much as other land by the same expenditure of labor? According to the new political economy that is to be done by competition. I would like to understand how there can be any competition, in any true sense of the word, between producers, one of whom secures his product at half the expenditure of labor which the other one does? Also, what authority there is for the assumption that the demand for a product should cease to be an active force in determining its price, even supposing the cost of transportation to be entirely eliminated?

When Mr. Ward has studied Mill enough to be able to understand him, his criticisms will appear to much better effect. I have not the space to attempt the task of clearing up all the ambiguities in Mr. Ward's criticism at this time, and will merely say that whenever it can be shown that any producer will continue to produce when the price of his product is insufficient to cover ordinary wages and inter-

est, then the theory that the lowest cost of production governs the price of the product will have some force.

Mr. Ward wants me to wrestle awhile with this proposition:

"Rent is a part of, and is included in the price of all goods sold."

Great Caesar! If the continued repetition of a proposition is any evidence of its truth, then I must concede the point. But, allow me to say that I wrestled with that proposition years ago when I first began the study of political economy; the logic of David Ricardo and Jean Baptiste Say convinced me of its error, and I have yet to meet with an argument of George C. Ward's that is complete enough to induce me to form another judgment.

In his second article Mr. Ward shows such a disposition to discuss matters from an erroneous standpoint, and such utter disregard of definitions, that it is really a difficult matter to tell what he is talking about. If Mr. Ward had attended to my definition of "natural price," he would have saved himself the trouble of introducing that illustration of the store rooms. No, the \$24,000 paid as rent does not increase the price of the goods sold. Why not? Simply because rent is not a part of price. The merchant is enabled to pay a yearly rent of \$1,200 because of the volume of his business, not because the natural price of his goods is increased by the payment of rent. A location where 100,000 suits of clothes or pairs of shoes may be sold yearly is a better location than the one where but 1,000 of such things may be sold, supposing price in each instance to be the same, and the larger rent which attaches to the superior location is but the recognition of this self-evident truth; the demonstration is obvious.

"How does rent rob and oppress the people?" This question is further evidence of Mr. Ward's neglect to attend to the premises of the argument and his inability to distinguish between the truth of a principle and its application. Whoever told you that rent robbed and oppressed the people, Mr. Ward? I am sure no thorough single taxer ever did so. Let me once more state the single tax position with respect to rent: Rent exists because of natural laws, and nothing which comes naturally can, of itself, rob or oppress the people; natural laws are all beneficent and for the good of humanity when given perfect application. The people are not oppressed because of the existence of rent, but they are oppressed because rent is made the means for private enrichment instead of being applied to its natural uses—the support of the social organism. It is not a question of the existence of a fact, but of the application of a fact.

Yes, the man who carries on business on his own premises has an income larger than the man who pays rent for his premises by just the amount of the rent, provided their business is of the same volume, and carried on at the same expense. But let the man who pays rent attempt to place himself on the same terms as to income as is the man who pays no rent by including his rent in the price of the goods sold by him, I am inclined to think he would soon discover his mistake. Did there happen to be no such a thing as a law of supply and demand which places it beyond the power of individuals to control price, only in so far as they can control the operation

of the law, then the philanthropic experiment of which Mr. Ward speaks might succeed. Mr. Ward would better study the action of this law in all its different bearings, before discussing economic matters much further. Until Mr. Ward decides to pay some attention to definitions, and thus avoid ambiguous expression, there is little use of attempting to reason with him. His jumble of words concerning Kansas corn and Pennsylvania coal is a mass of misconceptions which would take pages of space to straighten out. The logic which concludes that because Mr. Ward concedes that under the single tax "an addition to rent would simply be an increase of the tax," is of the best. It is logic which has all the certainty of a syllogism in barbara.

Mr. Ward should not allow his mind to become confused by the terms "rent," and "landlord." He should try and think of them separately. The question is merely one of the incidents of the single tax. It does not turn upon the existence of landlords, either in their individual capacity or collectively. The question is just this: Should society decide to absorb all rent by taxation what would be the incidence of such a tax? Would it be (1), upon the persons paying such tax (direct tax), or (2), upon the whole body of consumers of products (indirect tax)? By saying that "an addition to rent would simply be an increase of the tax," Mr. Ward maintains the affirmative of the first question. To maintain the affirmative of the second question the assertion must be "an addition to rent would simply be an addition to the prices which consumers would be compelled to pay for all products."

It seems to me that Mr. Ward prefers to criticise the single tax from an erroneous standpoint, and has no desire to free his terms from ambiguity. I pointed out some of the fallacies lurking in Mr. Ward's terms in an article which appeared in the MAGAZINE for August, 1892, and I asked him some leading questions bearing upon such fallacious expressions, a circumstance which he has found it very convenient to say nothing about. Also in my December article I called his attention to the inconsistency of attributing a destructive force to taxation with respect to bank circulation, and a preservative force with respect to rent, another question upon which Mr. Ward very discreetly says nothing. Perhaps Mr. Ward is like our republican friends who would have us believe that taxation is a force which may be made to operate in any given direction and perform any duty which suits the necessities of their argument.

I see that in addition to his system of political economy, Mr. Ward has entered upon the construction of a new system of ethics, and in connection with the fact I am moved to ask a question:

Here are two men having the same rights to the possession of an article of such a nature that but one of them may use it. Upon Mr. Ward's system of ethics, how would he go to work to allow the article to be used by one of these men while conserving the rights of both?

I hope Mr. Ward will see the necessity of understanding the single tax argument before attacking it further.

## CHARACTER.

BY WILLIAM WEILER.

Mr. Pray, in answering a fireman in regard to "the three most essential things" to "a man wishing to get up in the world," replies, his character, his reputation and his self-respect, and then specifies honesty, sobriety and truthfulness as separate items. I really think that a *good character* includes, at once, the cultivation of every good quality and the eradication of all evil traits. A man cannot have a good character unless he is honest; he will not be honest unless he is truthful; he can be honest and truthful but not sober, and lacking in this one thing (so highly essential in all avocations, and especially so in railroading) his character is not good in all its parts.

A man to be a *true success* ought to have a good character made up of sterling honesty, strict sobriety, unfaltering truthfulness, with a well developed sense of justice and a willingness to obey its dictates. A man of this character will be honest to his fellow-man, paying what is due, even if he has to forfeit some gratification of the senses to do it; he will be honest to his employers in giving them the best service he can render in return for demanding the best wages. His sobriety will keep his head clear for all emergencies—and while the word sobriety has been used in this connection, and is supposed to apply to the use of liquors, it would be better to use the word temperance now, and extend it to other things besides drink. A man may become intemperate in the use of other things, good enough in their place, but if over-indulged, very hurtful. Suppose a man has a light job, and presuming on that, he spends hours which he should devote to resting the body and mind, in the pursuit of pleasure wherever his fancy may lead; he pursues this course for weeks, months or years, coming to his work as a tired, peevish child, whom everything, no matter how trivial it may be, puts out of humor and makes it unpleasant for himself and his associates. Next to a drunken man, save us from a man who is not himself for loss of sleep and tries to make it up while at work.

Truth is a powerful lever to raise a man, for if every one can depend that everything said by him is true, he has achieved a great point and one of which he has reason to feel proud, and which will also give him a certain degree of self-respect.

Justice, when cultivated and practiced, will lead him to see what is due to himself and also to others, and will compel him to do it, even if it should require a self-sacrifice.

A man having these qualities need have no care for his reputation,

because that will take care of itself; and while a good character may at times be clouded and smirched by detractors and evil tongues, yet it will survive the test and probably shine out all the brighter after the smoke has cleared away.

A man having these qualities will be able to respect himself, for his conscience being at ease as far as his actions toward his fellow-man, he will be able to hold up his head with the best, and fear no man.

I, therefore, think that all may be summed up in saying, a good character is one requisite—and leave us to mention another thing, namely, knowledge; for a man having all the virtues and none of the faults of humanity, will be “only a hewer of wood and drawer of water,” unless he has knowledge to help him. He ought to have at least, a good common school education to start with, and not be content with that, but continue his studies, no matter in what branch of trade or commerce he may be engaged. In this fast age of progress, many trades and avocations which were unknown to our fathers, have sprung into existence and gained an unforeseen prominence; and in those that have been established for years, the changes and improvements made by the onward march of progress, have been so many and so varied that only the most alert and vigorous can hope to keep step in the advance, while the idle and sluggish must surely be left behind.

A good character and a knowledge of his business in all its branches, still needs another thing—a chance—to show what it can do. Sometimes these chances come by favor, sometimes by long continued and apparently unnoticed service, and sometimes they never come, or slip by unperceived. To secure these chances it may be necessary to cultivate a trait of character sometimes utterly neglected, and which has no doubt proved the one thing lacking in many men's career, and that is, the power to make and keep friends. A man may be honest, true, sober and just, and have all necessary knowledge, and yet surround himself with such an air of coldness or unsociability as to preclude any approach to a close acquaintance and to a display of his good qualities. As such, they pass through the world with their good qualities unknown and unrecognized and without being shown the chance or chances for the exercise of their capacity.

The list as I would make it is: A good character, a knowledge of your business, and a chance.

---

We hear so much now-a-days about faith cures, but it was not of the ills of the body of which I started to write, but of the faith which we used to place in block signals, and of which we have been almost cured by the ever recurring accidents and disasters that occur on roads which boast of having the best block signals out, which are to render accidents impossible. We are led to inquire, What is the matter? Are the inventors of the country balked in the attempt to make a safe system of signaling which shall prevent the destruction

of life, limb and property? We believe there are systems enough now to guard the roads if they were applied and properly managed, but when roads wake up to their responsibility and look for something the first item to be considered seems to be, "Is it cheap, and can it be run by cheap help? As a result we have roads run by block signals which block or permit passage at the will of the operators, who may or may not be alert or awake, or who may be engaged in other (to them) more important matters, and look upon the safety of the road and its patrons as a secondary affair. These operators are employed, not because they are young and inexperienced, but because they will accept the terms offered without demur, and thus have a chance at last to prove that "Penny wise, pound foolish" people are not all dead yet, but live and have a say in some of the most important interests in the country. The lessons of this winter written in blood and re-echoing with the cries of the wounded and dying, cry aloud for better safety appliances and better attendants than are generally placed in charge and it is no wonder that the brotherhoods of the land, standing as they do in the front rank of danger, demand and expect to have laws which will serve to better protect them and those intrusted to their care. In a number of states boards have been formed which will try to have suitable laws enacted looking to this end, and it is hoped that the good work thus begun will be continued until crowned by deserved success.

---

## PRACTICAL TALKS TO YOUNG ENGINEERS.

---

BY L. B. MOORE.

No. 3.

The practice of economy in locomotive management, and the practical operation of devices that have been adopted from time to time to reduce the operating expenses in the locomotive department, has been the source of much anxious thought among master mechanics. Still, but little change has been made in the locomotive in the past twenty years with respect to reducing the waste of fuel and energy; the extension front and brick arch being the only improvements whose utility is generally recognized.

It seems to be the order of the present period to experiment with compounds, and when we consider the fact that but a small percentage of actual energy is controlled and utilized, we may hope that the efforts in this direction may be successful in the near future. But, in the interval, we should make the best use of present opportunities. A conscientious regard for the best interests of our employers should actuate us to the practice of economy, not only in the use of fuel, which is the largest item in the expense account, but in the use of

all other supplies and material with which we are furnished. Our superior officers can set a limit upon all supplies with the exception of coal; in this we are in practical possession of the field, to save or waste as we will. There is no trouble for some engineers to practice the most rigid economy in their personal habits and home life, but in demonstrating it in locomotive practice they are miserable failures. In considering the economical combustion of coal, Mr. Boone, for many years in charge of motive power on the P., F. W. & C. R. R., stated, at a meeting of the Master Mechanics' Association, that the only solution of the question was to provide sufficient boiler room and grate area, leaving the rest to the intelligence of the fireman. There is much in this, there being no question but that both engineers and firemen, thoughtlessly perhaps, are responsible for more extravagance than they are aware of. In your experience as fireman you have noticed that on the same run, under the same conditions, more coal was used when with one engineer than with another, no better time being made. In noting this you were satisfied that the cause didn't rest with you; now that you are promoted, you have a chance to put some of your theories, as a fireman, into effect. Don't forget, become careless, and leave her down at 10 inches when you could do the work in the 6 inch notch, simply because you don't have to stand the back ache, as in former days. You may possibly have had an experience something like this: In pulling out of a station your engineer would leave her down in the corner "among the oil cans," just to hear her talk, until out of hearing of the boys on the side tracks. You didn't have time to look up for fear you would lose your fire, and on your arrival at the end of your run you found the flues leaking badly. Now there was more fuel used that time than was necessary, and it cost something to caulk those flues, to say nothing of the general wear and tear incident to such punishment.

We are all liable to lose sight of the value of small things; one extra scoop of coal more than is necessary isn't much of itself, still it is a unit of waste, and the aggregate of these units in the course of a year would surprise you. Then, taking all the engines on the system where you are employed in the same ratio, and you would cease to wonder why railroad officials are spending so much money in experimenting on compounds. But you will say that engineers cannot prevent this waste of fuel by firemen. You certainly can. Show your fireman not only what you wish done, but how to do it; he is working under your instructions, and your experience has been such that you are competent to instruct him. Obtain his confidence and respect, give him to understand that you are working in his interests, and that it is necessary to his future welfare and standing to practice strict economy in all things; he is as ambitious to succeed as you are, and is looking forward to the goal which you have just reached; don't be arbitrary with him, he is human like yourself, and can be just as mulish.

How should a locomotive be fired to obtain the best results with the least fuel?

Here is a query which, unfortunately, cannot be answered positively; with one kind of coal you obtain good results, with another you do not; this engine may be fired in one way, that one in another. Of course there is a cause for this, but we must consider conditions as they exist, and, if they can't be remedied, make the most of them. There can be no rule to guide you other than your judgment of requirements. I think that there is much extra labor performed by the fireman in getting up and down from the seat box to the deck. He probably thinks it rests him to sit for a minute, but there is more exercise involved in the act of climbing up and down than would offset what little rest he gets; besides, he is liable to fire too heavy in order to get this interval of rest. The rule that I found to be the best, was to make the least amount of coal cover the greatest space possible; to fire the light spots in the firebox instead of putting coal in each corner regardless of the necessity for it, and to use the back damper instead of the front one, for the reason that the speed of the train, in addition to atmospheric pressure, cuts the front of the fire when front damper is up, and more fuel is consumed with no better results.

[To be continued.]

## ECONOMY IN THE USE OF SUPPLIES.

BY WILFRED P. BORLAND.

---

Among some excellent papers treating upon some possible economies in the railway service, which appear in the January number of the *National Car and Locomotive Builder*, is one by Mr. T. W. Gentry, Master Mechanic of the Richmond & Danville railroad, that will be especially interesting to locomotive men. Mr. Gentry's paper treats of the economical use of oil, and he describes a system in operation on his road which, it seems to me, is so near perfection and so worthy of imitation that I reproduce his description:

1st. After giving the matter careful consideration we were enabled to decide just how much of each of the several oils to allow a certain class of engines for a given run, and arranged the capacity of supply cans accordingly, making a small allowance for emergencies.

2d. We do not allow engineers or firemen to draw supplies for their engines, but have a reliable man whose duty it is to examine oil supply cans and supply boxes, and satisfy himself that they are all right and in good order. He then measures the oil left over in cans, if any, and gets a printed form from foreman filled out for the account allowed, less what may be left in cans, and if none in the cans, then the full amount allowed, and locks them in the supply boxes, placing the supply box keys in a lock box in engine house for the purpose, the key to which is kept by foreman in day time and watchman at night, and to whom fireman has to report to get them; thus preventing the possibility

of an engine leaving the engine house without regular quantities of supplies, or trouble in getting them after storehouse has closed, etc.

3d. Oil cans for the several oils are standard shape and size, and supply boxes are standard size, and arranged accordingly, and the supply man quickly detects a missing or defective can, and replaces all leaky cans at once with repaired cans, which he keeps on hand. He examines all engineers' hand or feed cans, and cleans out and keeps to regulation size the end of long spouts, not allowing any broken spouts, or those with enlarged holes in ends to remain on engines, and provides good stopples for oil cans, a regular stock of which he keeps, and also provides strainer funnels for the valve and engine oil cans, to prevent lubricators and long spouts getting clogged up.

4th. This same man examines the tools and equipment of each engine upon arrival, and reports all missing or defective, and provides new or repaired ones to replace them. He also looks after the signal lamps or markers, and fills cups and replaces wicks; also supplies cups or burners that are out of order, and locks all tool boxes and disposes of the keys as in case of oil supply boxes. Engine-house men are not allowed to use oil cans, tools, or any supplies or equipment of engines lying over in house.

5th. All oil cups and oiling devices on our engines are standard for their respective places, as to size and capacity; those with feed regulators are of course adjustable; but our engineers are encouraged to work as near alike as circumstances will possibly admit. All oil cups with fixed feed are exact duplicates in every respect, and the adjustable feed screw-heads and jam-nuts, etc., are of exact standard size, enabling engineers to easily manipulate them with one small wrench, and leaving no excuse for failure to watch and set correct and economically feed oil.

Mr. Gentry's evidence is that this system has given the best satisfaction after a trial of several years, and that he appreciates the situation is shown by the very just remark that "We were convinced some years ago that the excessive consumption of oils on engines was not altogether the result of extravagant use of them by engineers and firemen," and he very justly attributes the greater part of such excessive consumption to a lack of proper system in drawing and handling supplies, loss by leakage, etc.; also improper attention on the part of men in engine house to their duties in regard to cleaning out oil holes, freshening up packing, etc. I have often thought that there might be a great saving in this direction by means of a definite system, and an abolition of the hap-hazard methods of handling supplies which so generally prevail. Most master mechanics, when they attempt a reform in this direction, proceed upon the theory that the engineer and fireman are entirely responsible for the extravagant use of supplies, and that the circumstances which would lead to their more economical use lie entirely within the control of engineers. Hence they imagine they are doing all they possibly can in this direction by laying down a few arbitrary rules which enginemen are expected to follow regardless of facilities for so doing, or they limit the quantity of oil issued to each engine and leave the question of proper tools for the successful handling of the limited quantity of oil to be fought out between the enginemen and the understrappers in the engine house. It is a pleasure to know that there is at least one master mechanic who has a just appreciation of the requirements of the situation. A system much in vogue a few years ago for insuring economy in the use of supplies, was that of awarding prizes for the best showing on the mileage reports. This system still prevails, I believe,

but not to the extent of former years. My experience with it (which I will own is limited, being confined to one road) is that it is a delusion and a snare. I recall one instance of an engine being credited, upon the performance sheet, with a mileage somewhere within the neighborhood of 40,000 with a consumption of but two gallons of lubricating oil. It is unnecessary to say that the engineer was working for the prize, and managed somehow to steal enough oil to keep his engine running, and make this showing. It would be interesting to have the opinion of some of the Richmond & Danville firemen as to the practical workings of Mr. Gentry's system; it must be pleasant to be relieved from the burden of looking after the supplies, taking care of the markers, signal lamps, tools, etc., and quarreling with the tinker about fixing broken and leaky cans and lamps.

I am of a philological turn of mind; I love to ferret out the meaning of obscure words or phrases; a new phrase is a sweet morsel for me. It can be imagined, then, with what delight I perused Mr. Knapp's "Some Questions," as I discovered in them an entirely new phrase, "momental inertia." I must confess that with all my philological enthusiasm, I am stuck on that. Will Mr. Knapp kindly relieve my anxiety by telling me what he means by "momental inertia"? Another assertion of Mr. Knapp's has attracted my attention—he says: "Of course the earth don't move." I was aware of the fact that the Reverend John Jasper, who has the honor of laying down the proposition that "De sun do move," was a resident of the south, but I did not know that he was a resident of Mr. Knapp's neighborhood, or that Mr. Knapp was one of his converts. I have long had a desire to know by what line of argument the Rev. Jasper supported his proposition, and as Mr. Knapp seems to be familiar with it will he please satisfy my curiosity?

---

### THE ECCENTRIC QUESTION.

---

MR. EDITOR:—It seems that some of the correspondents of the Mechanical Department have formed the idea that I am sadly mistaken as to an eccentric being a circle within a circle. Some learned gentleman has replied to my answer to "Combustion," which appeared in the December MAGAZINE, and says that mine is not at all a correct definition of an eccentric, bringing in Webster and M. N. Forney for proof of same. I am well aware of the fact that the definitions of Messrs. Webster and Forney are correct, but I do still say that a perfectly equipped eccentric is a circle within a circle. Neither Webster nor Forney have said anything to the contrary that I can see. I say again, that while an eccentric does not make exactly a circle, it is deemed by the majority of engineers a circle within a circle. The learned gentleman who replied to my article, and who,

for some reason, forgot to sign his name—not, I hope, for fear of contradiction by some one more enlightened than myself on this point, but through haste, probably—says himself, after contradicting my definition: “An eccentric will be found to be a true circle turning inside of another true circle, and obtaining its motion from the difference between the centres.” Now if the gentleman will kindly explain for my especial benefit what a circle within a circle is, I will then unfold to him a few practical questions as to an eccentric and its movements, that will agitate his thinking machine for a few moments and which may cause him to lose a few hours of pleasant slumber. I have never read Forney nor any other authority upon motive power; I speak from practical experience and personal observation. I have had no one to assist me in ferreting out these points but have arrived at all my conclusions unaided. Discussing different points on motive power is very good, but discussing them without experience is like singing a song without the air. Bear in mind, I do not write from theoretical but practical experience. I would like to write more upon this point, but as I have already used considerable space I will defer my argument until another time.

MERIDIAN, MISS.

*Thomas P. Knapp.*

---

## HOW TO FIRE A LOCOMOTIVE.

---

MR. EDITOR:—I was impressed with the article by Wilfred P. Borland, in the January MAGAZINE, “How to fire a locomotive,” because the method therein described is exactly my way of firing, since a short time after I began firing, four years ago.

I had no idea that any one else fired that way, except a few men who learned the road with me, and who were induced to follow my plan of firing, and I never knew one of these men who could not keep an engine hot from the start. As Mr. Borland says, I put one shovelful of coal in the left front corner, and one in the right front corner; as soon as that is consumed, which may be told by watching the stack and steam gauge, put one in the back left corner and one in the back right corner; then two through the centre of fire box; never using more than two shovelfuls at a time. Sufficient time should be given between each firing for coal to be consumed; in this way you can always tell where to place your coal, and keep a nice bright, level fire, which is essential to steam making; and you are relieved of the unnecessary work of using a scraper to level the fire with, which is detrimental to the fire, causing it to clinker when there is sulphur and iron in the coal. The secret of easy and economical firing is to fire regular, frequently, and a little at a time, the depth of fire depending upon how hard your engine is worked, and how fast you are running. An engine working very hard on a

hill, but running slow, requires very little coal; while on a level, working hard and running fast, she requires a great deal of coal. The coal record depends as much upon the way the engineer works his engine and carries his water as upon the fireman's method of firing. Working an engine as close to the centre as possible, and using full boiler pressure is essential to economy; but there is nothing that has so great an influence upon the steam pressure as the manner in which water is pumped into the boiler. Beware of the man who opens up his engine before shutting off the injector! you will always be hard up for steam with him. The injector should always be shut off long enough for the engine to get hot before commencing to work steam; then, as soon as she is cut back to where she is to work, put on the injector. It is also necessary to shut off the injector when running through dips and levels, just before reaching a rise; as the steam will go back as soon as the engine is given more steam for the rise, if the injector is left working. I contend that carrying water should be a part of the fireman's duty. I think he can show better results by keeping nearer the same steam pressure, and the right quantity of water in the boiler (which is all it will carry without working it, because the same heat will generate more steam from 500 gallons of water than from 400) than the engineer can. The engineer has so many other duties to perform, that often he does not give the steam gauge and injector the attention necessary to even steam; which is essential to the economical use of the boiler and flues. For the above reasons, I think firemen should be taught how to carry water.

KNOXVILLE, TENN.

*Richard H. Hart.*

---

### CLINKERS.

---

Did you ever notice how easily some men get into trouble? They seem to be constantly looking for it and they always get what they are looking for.

And then, again, did you ever notice how easily some men get out of trouble? They are either mighty good talkers or else they have an immense pull.

This world is indeed full of mysteries that are past finding out, and the man with the best record is frequently found at the bottom of the heap.

Here's one of the mysteries: Firemen on the Savannah, Americus & Georgia Railway are working for \$35 a month. That's pretty big pay, ain't it?

What in the world do they do with so much money? Just think

of a man drawing t-h-i-r-t-y-f-i-v-e great big dollars every month! Railroad companies are mighty liberal down in that country.

This practice of paying such excessive wages to ordinary workingmen is a bad one and ought to be stopped. The men are liable to contract extravagant habits with so much money in sight.

Speaking about extravagant habits, that habit of piling a half ton of coal into the firebox of a free steaming engine so as to get the chance of sitting down a few minutes, is an extravagant one.

The habit of telling when your oil cans are full by running them over every time you fill them, is another extravagant habit.

And the habit of keeping your clean waste tucked into promiscuous holes and corners about the cab is another.

Don't run away with the idea that you know it all; don't imagine that your way of doing things is the best way on top of earth; don't be ashamed to ask for information; don't be cranky; don't worry about difficulties that can't be helped. Always do the very best you can, and then, coming back to mysteries again, it'll be a mystery if you don't get to the front some time or another.

---

### SOME THINGS TO REMEMBER.

---

The following questions and answers are from *Locomotive Engineering*:

M., Frankfort, N. Y., writes: 1. Will you inform me if there is a rule for locating the pin of the link-saddle, or must we cut and try? A.—There is no rule. When the motion is laid down on the drawing-board the proper point of suspension for the link is found by trial. 2. Why will an injector not throw water against its own pressure of steam when the water is below the check? A.—The injector will throw water against the pressure of steam when the water is below the check. That it will not do so is a common delusion.

L. W. T., Nashua, N. H., says: Suppose an engine stood on the forward center with the steam-chest off, and the valve showed a port opening of  $\frac{1}{8}$  inch. Now, if I file off  $\frac{1}{8}$  more, not moving anything, and I do the same thing on the other end, and afterward move the eccentrics to give the engine the original  $\frac{1}{8}$  inch lead, what will the effect of the change be? A.—You have reduced the outside lap  $\frac{1}{8}$  inch, which will slightly reduce the scope of the engine for working steam expansively.

R. M. Y., Elizabeth, N. J., writes: I find that some locomotives have the rocker arm made with one end out of line with the other. I see no sense in the thing; why not make the two arms in line? A.—The offset is on the lower arm, and is made to put the lower arm at right angles to the center line of motion. The adjustment of the valve-gear requires this arrangement in some engines.

C. H. M., Joliet, Ill., writes: I have been trying to study out the working of compound engines and I can not get it through my head how they work. If you exhaust steam from cylinder A into cylinder B, the back pressure will be

sufficient to obstruct the piston in *A* cylinder to the extent of the positive work done on the piston of *B* cylinder. Where is the gain? *A.*—The piston in the low-pressure cylinder has from two to three times the area of the piston in the high-pressure cylinder, which permits the exhaust steam to perform a margin of useful work after the drawback of back pressure is considered. For instance: The high-pressure cylinder exhausts steam at 90 pounds. The area of the high-pressure piston is 314 square inches, so we have  $90 \times 314 = 28,260$  pounds pressure against the piston. The low-pressure piston has an area of 707 square inches. Then  $90 \times 707 = 63,630$ , the positive work done by the low-pressure piston, giving a margin of 35,370 pounds after the amount of back pressure is deducted.

Learner, Sioux City, Iowa, says: I should like to get a plain definition of a heat unit on a practical basis. *A.*—A heat unit is the amount of heat required to raise one pound of water at its greatest density one degree Fahrenheit. If you light a spirit lamp and put it under a glass flask containing one pound of water, and it is found that the temperature of the water is raised five degrees Fahrenheit every minute, the lamp has practically a capacity of five heat units.

Mr. G. A. Griffin, Biddeford, Me., asks: How the air gauge is arranged for the black hand to show one pressure and red one another, and this with one pipe. I have "Sinclair's Locomotive Engine Running and Management" and "Forney's Catechism," but cannot find it in either? *A.*—There are two gauges in one case and a pipe to each.

F. H. R., Philadelphia, writes: I claim that George Stephenson, the inventor of the locomotive, was the inventor of the Stephenson link motion, but some of the men in the shop say I am wrong. We decided to refer the dispute to you. *A.*—The link motion was invented by an apprentice in the Stephenson works at Newcastle, England, named Williams, and put into practical shape by a pattern maker named Howe, in the same works. It was applied experimentally to one of the Stephenson locomotives, and, to the surprise of the leading engineers of the time, it was a great success from the first. Stephenson had no hand in the invention. It is a mistake to speak of George Stephenson as the inventor of the locomotive. He was merely a prominent improver of the engine.

John Strouse, Bellwood, Pa., writes: Could you inform me if a Baldwin four-cylinder compound, high-pressure cylinder 13-inch, low-pressure 22x24 inch stroke, is equal to a simple engine 20x24 inch, both of same general dimensions? *A.*—In reply to this and several others of the same character, we append a letter from the Baldwin Locomotive Works on this subject: "The formula is the same in principle as that for calculating the tractive power of a single expansion locomotive. The formula for single expansion cylinders is: the square of the diameter of the cylinder multiplied by length of stroke multiplied by the mean effective pressure on the piston and divided by the diameter of the wheel. The result is the tractive power. For example: The tractive power of a 20x24 inch cylinder with 48-inch wheel and 100 lbs. mean effective pressure would be  $\frac{20^2 \times 24}{48} \times 100 = 20,000$  lbs.

"For a compound locomotive a formula on the same principle is used, as follows: Assuming the diameter of high-pressure cylinders as 13 inches and that of low-pressure cylinders as 22 inches, we have  $\frac{13^2 \times 24 \times \text{M.E.P.} + 22^2 \times 24 \times \text{M.E.P.}}{\text{diameter of wheel.}}$

= tr. p. The diameter of piston of driving-wheel and the length of stroke are to be expressed in inches. The mean effective pressure in the low-pressure cylinder must be arrived at empirically, and experience has shown that it may be taken at  $\frac{\text{M. E. P. in high-pressure cylinder.}}{2.7}$  In designing the engine, how-

ever, the diameter of the high-pressure cylinder is found by allowing a ratio of 3 to 1 in the proportion of the squares of the diameters of the pistons as near as even sizes will permit."

And here are some from *American Machinist*:

C. B. P., Raleigh, N. C., writes: Please favor me with a reply through your columns as to the following: Does the piston stand still momentarily when the pressure at one of its faces is equal to that on the other face until again taken up by the momentum of the crank-pin? A.—No; the momentum of the piston, rod, etc., causes it to move towards the end of the stroke. 2. I contend that at some part of the stroke the piston does stop, but others think differently; please settle the dispute for us. A.—Some contend that the piston stops at the ends of the stroke, others dispute it, but whether the piston stops at the ends of the stroke or not is of no practical importance or value whatever, and it seems to us that debates on this subject generally result in a waste of time.

—, Hamilton, Canada, writes: I would like to have a rule or formula for finding the thickness of the walls of a steam engine cylinder, one that will hold good under any pressure, and still give thickness enough after the cylinder has been worn and then trued up. A.—Multiply the diameter of the cylinder in inches by the steam pressure per square inch; also multiply this product by the constant decimal fraction .0001; add to this last product the square root of the diameter of the cylinder in inches multiplied by the constant decimal fraction .15; the result will be the thickness of metal in the barrel of the cylinder. To show the application of this rule we will work out the following example: What must be the thickness of metal in the barrel of a cylinder 49 inches in diameter; steam pressure 60 pounds per square inch? Here we have  $(49 \times 60 \times .0001) + .15 \sqrt{49} = 1.34$  inches for the thickness of metal. To this should be added say  $\frac{1}{8}$  inch, to allow for wear. 2. Does the governor of a steam engine control the number of revolutions per minute of an engine? A.—Within reasonable limits it does.

A. H. K., Allegheny City, writes: A. claims that a plug of given size will not pass through a ring of the same size. B. claims that it will. Who is right? A.—It is not certain who is right. We believe that Sir Joseph Whitworth claimed that a plug and ring gauge of precisely the same diameter, made of hardened steel, could not be put together except by the use of sufficient force to stretch the ring or compress the plug, or both. We are not aware, however, that Whitworth ever proved this, or that there can be any proof of it one way or the other. A plug and ring gauge can be made to fit each other so closely that they cannot be put together by hand dry, nor with any other lubricant than that which is of very fine quality, and even then the plug must be very skillfully inserted, and very quickly withdrawn without twisting it, or it will stick so tight that it will have to be driven out. Such a plug and ring are at least very nearly the same size, and, so far as we know, there is no way of proving by measurement that they are not precisely the same size, nor even that the ring is not slightly smaller than the plug, the metal being possibly slightly compressed or stretched as they are put together.

C. H., Watsonville, Cal., writes: We intend to put in a 4-horse power gasoline engine to pump water for irrigating purposes. The water is to be raised to a height of 15 feet. The pump is to be of the centrifugal type; what size of pump will we require? Some parties say that one with a 3-inch suction and 3-inch discharge is sufficient, and I say that it should have a 5-inch suction and 5-inch discharge. Who is right? A.—We believe your advisers are correct; in our opinion the engine will not handle a pump with a 5-inch discharge and raise water to a height of 15 feet. 2. What size of a pump will be required? A.—One that will raise about 600 gallons per minute to the required height. 3. I figure that the water will have to pass through the 3-inch pipes at the rate of about 2,904 feet per minute; is this right? A.—We do not see how you can get such a high velocity. The engine cannot run satisfactorily a pump that can discharge more than 600 gallons per minute. Each gallon contains 231 cubic inches, and 600 gallons contain  $231 \times 600 = 138,600$  cubic inches; this product divided by the area of 3-inch pipe, which is equal to 7.06 square inches, gives a speed of  $\frac{138,600}{7.06} = 19,631$  inches per minute, or  $\frac{19,631}{12} = 1,636$  feet per minute.

# WOMAN'S DEPARTMENT.

EDITED BY IDA A. HARPER, INDIANAPOLIS, IND.

## THE MAGAZINE.

By this time our readers have had an opportunity to become somewhat accustomed to THE MAGAZINE in its new form, and from every side we hear words of praise and delight. The order of the B. of L. F. has a right to feel and express a pride in it. No other labor organization in the world has such an organ. It ranks with the best magazines of the day in its appearance and its contents, and it is destined to command even greater respect, and to wield even larger influence in the future than it has done in the past, although it has been a widely-recognized power for many years. It is a pleasure to read such a publication every month; it is a privilege to write for it.

With this number I enter upon my eleventh year as editor of the Woman's Department. Amid all the cares and duties that enter into every busy woman's life, through all the vicissitudes that are inseparable from existence, a portion of each month has been religiously set apart for this work. Wherever the travels of business or pleasure have taken me, during all these years, the Woman's Department has been my companion. It has become like an old familiar friend whom I should greatly miss if taken away. I have watched its growth and improvement as one would that of a beloved child. Its correspondents seem like personal acquaintances. Their letters have been written while they were girls and afterwards when they were wives and mothers. Their ideas, their experiences, their advice, have been always welcome, and, with but few exceptions, have been given a place in the MAGAZINE. I am very fond of women, very proud of their achievements, very tolerant of their faults. They have not had an even chance in the world. My best friends have ever been among women. Their love, their sympathy, their assistance have always been given freely and fully when they were needed. It is a happiness to me to extend a helping hand, to speak an encouraging word at all times. My keenest regret is that women sometimes fail to fix the standard high enough for themselves and do not live up to the best that they are capable of. The salvation of the world must come through its women, and there will be still a nobler race in the future than the past has seen.

Among the thousands of letters that have been received for this department, during these ten years, not one has contained an unkind word. Scores of private letters have been written to me, filled with expressions of love and confidence and commendation. Many women have offered their earnest thanks for the help they have received from the Woman's Department. Others have sent flowers and me-

mentoes of various kinds. My heart has been deeply touched, I have felt my unworthiness to bear so grave a responsibility and have recalled with sorrow the many shortcomings and imperfections in my part of the work.

We have appreciated the interest taken by the men in our corner of the MAGAZINE and we have to thank them for many interesting letters. Some which have aroused the ire of the sisters and called forth many sarcastic rejoinders, were written for that very purpose, as their authors explained in private letters. The communication signed "Kicker," which created the greatest excitement, was written by a bright woman who wanted to have some fun. She was gratified beyond her expectations, for the replies poured in for nearly a year, until we had to entreat our correspondents to desist, and finally fill the waste basket with their productions. Besides the amusement that it furnished it called out many sound and wholesome opinions on the relation of husbands and wives. The new regulations, shutting out anonymous communications, will deprive the department of some of its picturesque features, but will add others that are more desirable.

---

## DRESS REFORM.

---

The agitation of this subject has assumed serious proportions and its promoters have taken up the matter in a business-like manner. Heretofore the words "dress reform" have called up a vision of a woman in that ugliest of garments, the pantaloons, or the same thing in a modified form, called "bloomers." Against the introduction of either of these innovations there was an almost unanimous protest from both men and women. And yet there is an admission from many of the latter that a reform of some sort is badly needed. Since between three and four million women have entered various employments which require them to go out in all sorts of weather, there has seemed to be an absolute necessity for a more suitable kind of dress. Thousands of women, who are not bread-winners, are interested in many public matters, in charitable and reformatory work, in organizations of all sorts and in business which calls them out of doors a great deal. Women take more physical exercise than they used to, and, it may be broadly stated, that they entertain more sensible and independent views on many things than did those of past generations. All of these classes of women realize the many serious disadvantages of the present mode of dressing.

But it has seemed important that there should be no sacrifice of beauty or harmony, as had been the case heretofore when any reform in dress had been attempted. It is natural and right that women should take a proper pride in the adornment of the body. They are

the conservators of the beauty and grace of the world, and anything should be deplored which would render them less beautiful or graceful; it is a question, though, whether the prevailing styles, as a rule, do not take from rather than contribute to these qualities. Probably the missionary who has done the greatest amount of good in the direction of reforming the faults of woman's attire is Mrs. Jenness-Miller, editor of the magazine *Dress*, and a lecturer of wide repute. She has shown that it is possible to dress according to the best rules of comfort and health without sacrificing beautiful effects but rather enhancing them. Women of fashion have not in many years been dressed as comfortably as now. The shoes are low-heeled, the stockings long, the underwear warm and neatly fitting and the numerous and cumbersome skirts have been discarded. There is much to be desired, however, in the outside dress and the wraps, which have nothing to recommend them but a certain picturesqueness.

When it was announced a short time ago that trailing skirts were again becoming fashionable, it did not seem possible that our women, having experienced the comfort and convenience of short dresses, would put them on, but here they are, sweeping the sidewalks to the disgust of all cleanly people and to the ruin of the garments themselves. The skirts are too scant for modesty or convenience, the sleeves too large to permit the wearing of a wrap. The World's Fair is approaching, which all the women in the country will want to attend. It will be a time of heat and dust and crowds beyond anything we have ever experienced. Are our countless thousands of women going to this exposition dragging their trails in the dust or adding to their burdens by carrying them about? Are they to wear a clinging skirt which will not allow a pocket? Are they to increase their exhaustion with a glove-fitting waist that requires the "snuggest" of corsets? And, as if to crown the folly, the fiat has now gone forth that that abomination of abominations, the hoop skirt, is again to make its appearance. Imagine an army of women at the World's Fair arrayed in crinolines! The managers should see that they are refused admission at the gates. In England a society of distinguished women has been formed to use their influence against a renewal of this vicious fashion, and the Princess of Wales has been appealed to, to pronounce against it. It is fervently to be hoped that American women will refuse to adopt it, and yet, judging from the past, we cannot feel sanguine. At the last meeting of the great Woman's Council in Washington a committee was appointed to consider the subject of dress, the more especially in regard to the costumes that are to be worn at the Columbian Exposition. They have reported in favor of four different styles, all short enough to fully escape either dust or mud, loose waisted, provided with plenty of pockets and yet very pretty and tasteful. A number of women already are having their dresses made which they expect to wear in Chicago next summer, and we venture the prediction that those who adopt something like the above will be regarded with envy, before the season is over, by those who are trying to "do" the exposition in garments made

in the extreme of fashion. In no other direction do women have so large an opportunity for exercising individuality, independence and good judgment as in this matter of dress; and while, to avoid being conspicuous, it is advisable to follow in a measure the prevailing styles, this should never be done at the expense of health, comfort or convenience.

---

## HERE AND THERE.

---

Johns Hopkins University, one of the most distinguished in the country, has received an endowment fund of half a million dollars to be used for a medical school. This sum is entirely the contribution of women, over three hundred thousand dollars of it being the gift of Miss Mary Garrett. The terms on which it is made are that women and men shall share alike in all the advantages of the school. If at any time there shall be any distinction made between the two sexes the money reverts to Miss Garrett or her heirs. This is a splendid act and stands out in beautiful relief in contrast with the thousands of dollars which have been given by women, in the past, to institutions whose doors were closed to women. As women become more thoroughly interested in obtaining equal rights and privileges in all things for those of their own sex, they will place their money and their influence where they will help to bring these about.

In the death of Gen. Benjamin F. Butler the cause of woman has lost an influential friend. He was always an advocate of woman suffrage and, as Governor of Massachusetts, made an effort to secure it for the women of that state. He was instrumental in securing an act of congress giving woman lawyers the right to practice in United States courts, and in many ways defended the sex. George William Curtis, who passed away a few months ago, never failed to use his voice and pen in advocacy of equal rights for men and women, and advanced some of the strongest arguments ever made on this question. John G. Whittier, who died recently, was, during all his long lifetime, an earnest champion of the franchise for women. In all of the eulogies that were pronounced upon these men by the orators and the press of the day no reference was made to this part of their work, but after the cause of equal rights has been gained their historians will take pride in relating their share in bringing it about.

The New York Sun, in discussing the question of women's work, advises them to seek employment where they will come least into competition with men. As men have monopolized about all the work of the world except that of the household, the Sun would have

women confine themselves principally to that. This advice comes too late, as women have found that they can enter into competition with men and still hold their own pretty well. They are apt to be governed in their choice of a vocation by the same two considerations that influence men; they select one that is best suited to their tastes and that offers the best pay. There would be just as much sense in advising men to select from one or two or a half dozen occupations. Let women choose the work they prefer and then give them a fair chance.

---

Dr. Buckley, editor of the New York *Christian Advocate*, who has fought with unceasing hostility the admission of women delegates to the Methodist general conference, makes the brilliant argument that the fact of women having long hair shows that it is intended they should be in subjection. The Baltimore *Methodist* wants to know what he has to say about the short-haired women of Africa? We would like to ask why it was, then, that Samson lost his strength as soon as his hair was cut off? Also whether, if men should let their hair grow and women should keep theirs short, the men would then be in a state of subjection and the women become the rulers? In other words, do men rule with their hair or their heads.

---

New York is to have a convention to revise her state constitution, and both branches of the legislature, at the suggestion of Governor Flower, have passed a bill providing for a representation of woman suffragists among the delegates. This will be the first instance on record where the women of a state have had a voice in making either the constitution or the laws under which they must live.

---

## TO OUR CORRESPONDENTS.

---

For the past two months we have given positive notice to our contributors that we should no longer use contributions which were not signed by the writer's real name. Notwithstanding this notice the usual number comes to hand this month either without the correct signature or with the request not to publish it. Our orders are explicit upon this point and there is nothing to do but consign them to that much talked of waste basket. This is done with regret in some instances, as several of them are very interesting. Among these may be mentioned those of "Moree," The Dalles, Oregon; "Girtie," Burks Falls; "Cora," Delphos, Ohio. There were also others of merit. We hope our writers will feel sufficient pride in this department to take such time and pains with their work as will make it worthy of their own acknowledgment. We have stated several times that we

do not want letters, but articles or essays upon some particular subject. We trust Mrs. T. A. O., of Chicago, will send us something of this kind in place of her letters of this month. Let us hear from our old contributors who have sent us so many readable communications in the past. It is a matter of regret that Mrs. T. W. D., of Trinidad, Col., did not grant permission to publish her private letter to the editor. Her commendation of the course of this department is very pleasant to hear, and her arguments for larger rights for women should be placed before our readers. We suggest that Mrs. D. write an article on that subject for our Woman's Department.

---

#### OUR PRIVILEGE.

---

Jean Ingelow says of woman's rights: "I don't approve of them at all. We cannot have rights and privileges, and I prefer privileges. We lose our privileges when we demand our rights." Let us look for a moment at these words from the pen of a woman. What a pity! "We cannot have rights and privileges." Every word of this is gospel truth, but what follows? "And I prefer privileges." I wonder if Jean Ingelow knew or thought of the feeling of sadness and pity these four words would bring to the hearts of hundreds of noble women who are devoting their time, their talent, their brains and their energy for the advancement of the human race. Had she realized how they would sink into the hearts of those who read they would forever have remained unwritten. A distinction is here made between rights and privileges.

We are always a little suspicious of those who enjoy privileges. A privilege does not represent a right. Take for instance the saloons which exist simply by conferred privilege, or the gambling dens or houses of ill repute. Privilege is a right given. Webster defines it thus: "A peculiar advantage or right." Right means that which is just or correct. Privilege is something which can be conferred and usually conflicts with the rights of others. The license system is an example of this. We will look at Bouvier's definition of license. He says it is "a right given by some competent authority to do an act which without such an authority would be illegal." Let us never forget that our rights can never be conferred, never!

"Yet we lose our privileges when we demand our rights." How many women, I wonder, would be willing to lose their privileges in order to obtain their rights? Methinks their names are legion.

A paper was handed me a few days ago which contained an article on woman suffrage. One paragraph read thus: "The woman knew whereof she spoke the other day who said, 'The only right I want is to make my home and husband happy.'" Can this be done? Is it possible? Can a home be made happy when only a few blocks away little children are crying for bread, or a wife trembles in terror at a drunken husband's approach, or a mother sits weeping over an only boy who has wandered astray? Have we then come to regard this matter in such a narrow, selfish light as this?

Further on she writes: "Why should we ask for rights?" Ah! here is the point, and this is a question scores of women ask each other daily. In my work since June I believe I have been asked this question hundreds of times. We are going to reply to it, first objecting to it on the ground of principle. *Why* should we ask for rights? We ask for our rights because we are denied them. We are not asking for something we already possess. Even if this gov-

ernment was a government of the people, by the people and for the people, which it claims to be, we would still demand our rights because they belong to us, and no man has a right to deprive us of them. Let every mother read the age of consent law which protects the man but makes an outcast of the girl. Let her look upon the dramshops, let her stand and see the rum-seller deal out the liquid fire which consumes the soul of her boy, degrades his manhood and sets his brain on fire. Let her enter the gambling room and perhaps see her hard-earned dollar staked upon a card, and where sin and mirth hold high revelry. Let her look upon the statistics which show that twenty thousand girls become prostitutes every year in Boston because of poorly paid wages; no alternative between starvation or ruin. Let her visit the factories in the United States where four million children are employed; yes, let her mind dwell but for moment upon the awful crime of child-labor which blights this nation and which society allows to exist. Let her review the laws in regard to property and pensions and see how unjust they are, and lastly let her think of the nine million mortgages in this country, of the two million men out of work, of the five hundred thousand tramps, and of the aggregate debt of twenty billion dollars. Let every woman think of these things; of the cause and the remedy. We must reason from cause to effect. We cannot have an effect without a cause.

Here is a wonderful effect. Truly there is a wonderful cause somewhere. I want the women to think of all these facts and then see if they cannot answer the question, "Why should women be allowed to vote?"

MURPHYSBORO, ILL.

Ida Orrell.

[The editor has taken the privilege of using the writer's name without her consent, which perhaps she has no right to do. We think, however, that Miss Orrell can have no objection to admitting the authorship of such excellent articles as she furnishes to the Woman's Department. We ask pardon if we have offended.—Ed.]

---

#### A GOOD MOTHER.

---

"Mother" has been a theme for writers and orators for ages. Sons and daughters have proclaimed her goodness and virtue and benign influence in song and in story, and in "living marble." And yet it seems to me that I may add a few words in defense and in support of, and in an effort to honor the good mother. There are mothers, no doubt, unworthy the name; whose every impulse and maternal act is a protest against the burden which maternity imposes; and while we may not feel like bestowing praise on these I think that many of them are fit objects for our pity. But it is not of these that I wish to write. In these days when a woman's "sense" is estimated by the number of children she *does not* have, it seems to me that the *good mother*, the one who bears her burden willingly, cheerfully, gladly, and rears for the world healthy, intelligent and moral men and women is worthy of special encouragement and the outspoken commendation of all *good* people, and I think I had better add, sinners also. Unless something is done to make good, strong, hearty and intelligent babies "fashionable" the protection of the "infant industry" will soon take on a new signification. And I am ready now to declare that a bounty on the production of good, moral, sensible, educated and useful citizens is about as commendable as a bounty on sugar. Speaking of pensions, it is my belief that the woman who gives to her country four or five desirable citizens is in every way as much entitled to a pension as many now on that honored list. My thoughts at this time turn to a woman to whom the recurring years brought

eleven children, five only of whom were permitted to arrive at man's estate and had, up to last advices, to put it in its least egotistical light, "successfully evaded the penitentiary." Let us pause a moment and think of the battles fought, the trials, the privations, of being separated by miles and miles from the home of her birth, from the friends of her girlhood, isolated in the "far West," with work, sickness, death, meager income and still untold sorrows, and who will hesitate to say she is worthy of a pension.

"Home is where the heart is," it has been said, and it is needless to add that the heart is always with the good mother. While mother lives and holds domain over her own hearthstone, we shall have a home. No matter what our conditions or surroundings we feel that we are going home when we go to mother's; and when mother is gone how homeless we shall feel. No more home-going, no more "court of last resort" when all our plans for happiness, or wealth, or position have failed. Mother's arms return the embrace, and mother's lips receive the kiss we fain would bestow on a loved form gone from life, and on mother's breast we lay our heads when the tears *will* come, and we feel, in spite of years, that we are only helpless children. Indeed we are *always* children to mother. Mother won't tell. Mother won't say—aye! she won't even think, that we are foolish and childish for giving way to our grief.

But I will close. I thought I might pay some fitting tribute, some slight testimony to the memory of the good mother. I find the task beyond my mental powers of delineation; but were I the great recorder of lives well spent, and it was given me to inscribe to the memory of woman the most sacred, exalting and loving tribute, I would grasp the eager pen of fame and quickly write athwart the iridescent page in characters of gleaming glory,

SHE WAS A GOOD MOTHER.

OMAHA, NEB.

A. A. Tucker, (Friar Tuck.)

[An excellent article, one which will meet with a quick response in many hearts. There is no love on earth to be compared to a mother's—free from passion, pure, unselfish and unchangeable. It clings the closer when all others forsake, and it endures to the end of time. The loss of a mother takes something out of life which it is not in the power of the world to replace.—ED.]

## HENRY LEWIS ALBERTE.

### ONLY A FIREMAN'S SON.

Two years old, only two years old,  
Yet the little elf is worth his weight in gold.  
He takes the household all by storm  
With his baby ways and caresses warm,  
Father and mother, uncles and cousins,  
Friends and relations by the dozens;  
Grandpa and grandma and Aunt Mary  
All dearly love this darling baby.

Two years more, just two years more  
And baby Harry will then be four,  
But our love for the sprite can ne'er grow  
stronger  
As the months roll on and the years grow  
longer.

"I am danma's feetheart and danpa's boy,"  
He says, with his heart brimming over with

WASHINGTON, IND.

joy.  
Aunt Mary and uncles Henry and Lon,  
To each one he says, "I love oo, too."

We love him far dearer than millions of gold,  
This little shaver just two years old.  
Oh! who could harm this baby fair,  
With his sweet dark eyes and his sunny hair?  
Who could lessen the innocent joy  
Of this little, prattling, two-year old boy?

Every night, e're he goes to rest  
He clasps his small hands above his breast,  
And though he cannot fathom the prayer  
He asks God to take him under His care,  
And the angels hear the words simply told  
By this little darling just two years old.

Mrs. Henry B. Jones.

## DEDICATED TO THE UNITED BROTHERHOOD.

BY MRS. J. D. HOLMES.

A Savant old, and gray, and learned,  
 Sat dreaming alone, as his fire burned;  
 He saw the primeval earth as it stood  
 When the Divine Creator pronounced it  
 "good."  
 He saw the elements stored within,  
 For the weal or woe of coming man;  
 All cold and still, and darkly confined  
 Till released by Progress and Labor com-  
 bined.  
 Bearing commission from the great "I Am,"  
 To eliminate, fashion, combine, and name,  
 And make of the earth, as He intended it  
 should,  
 A place meet for visits of angels and God;  
 On divine behest those angels two  
 In joyful obedience quickly flew.  
 Then the vision showed the earth grow bright,  
 And the future dowered with work and light.  
 Twin angels leading in worthy zeal,  
 Myriads wearing the badge and seal,  
 The royal insignia of heaven  
 Showing man's dominion o'er nature given.  
 They touched the crude material of earth  
 And raised it above its intrinsic worth,  
 In the inky blackness of the dark coal mine  
 Of radiant light they found the sign:  
 Elementary principles one and the same,  
 In charcoal darkness and the diamond's  
 flame.  
 He saw inventions new and sublime  
 PORT LAVACA, TEX.

Far down the misty ages of time;  
 And hosts of workers still wearing the seal,  
 Moving shovel and spindle and wheel;  
 Saw the black-throated engine sweeping  
 along,  
 It's shriek and whistle an exulting song,  
 The wreathing smoke, as incense given—  
 Sturdy labor's ovation to heaven.  
 Ye stalwart heroes! Ye bear the key  
 To royal manhood's highest degree,  
 Since ye follow the heaven-descended one  
 Known as Joseph the carpenter's son;  
 Who poured contempt on idle pride,  
 And all true labor sanctified.  
 Brave boys! the Savant's dream is true,  
 And the breath of God has power over you—  
 Transformed in a moment, from blackness,  
 I ween—  
 You'll stand in the glory of diamond sheen.  
 Then heed not the narrow taunt, nor fear  
 The half-bred aristocrat's puny sneer;  
 Still honor invention, let not pride and disdain  
 Make you antagonize brawn and brain.  
 But alive to oppression, be on time with the  
 stroke  
 That will grind to powder grim capital's yoke;  
 Of God's mingled life cup freely quaff—  
 Shun the deadly draught of the golden calf—  
 Creators as well as consumers are you,  
 And the world must honor where honor is  
 due.

## WOMAN'S WAY.

Thanksgiving has passed, Christmas is coming and perhaps ere this meets your eyes, New Year's will have passed by and left you with your baskets full of useless remnants of the old one that, while they should have been blended into a beautiful pattern, have only been thrown carelessly into a heap. Good resolutions, unfulfilled hopes, thoughtless actions, cruel remarks, all tossed together with no system or difference.

I hope this New Year will bring better results to us all. Good resolutions may be kept; there is no reason why they should not. And hopes are some times fulfilled, if it is the exception rather than the rule. It pays to try. Try until you are perfect in any one calling and you will be called up higher. No one is ever doomed to live long beneath himself in the estimation of those who are the best judges of one's merits. A person may, like the little girl, wish that some one would give others the power "to see me as I myself see," but that power is seldom given. On the other hand, all the real worth seldom goes unrewarded.

No matter how long and dreary the rainy day is we know the clouds must break away and the sun shine through at last. We have only to be patient and wait, to be ready when the sunshine has come to improve each shining hour. Not by turning the house inside out at the expense of nerves and mind, truly, but in any and all useful and convenient ways that good sense and present comfort will admit. We should never be too busy to be comfortable, or too weary to be patient and sweet-spoken.

The earliest recollection I have of my mother, the very first impression left on my baby mind, was one of fragrance and beauty. My mother stopped to

point out to me the cause of a delicious, sweet fragrance that seemed to fill the forest where we were, and to tell me that it emanated from a beautiful, large, white flower in a green tree near by—a magnolia. Every detail of that scene is painted on my mind at this writing, and yet two years had not rolled over my tiny head when the incident happened. Dear mother, now at rest in the home of the blessed, your after life in all its bearings was ever as pure and fragrant in good deeds, as was fair the lovely scene then shown me.

How little we think of the consequences that may result from the smallest action on our part toward the sweet little lives entrusted to us. There is so much in life that is hard and bitter, that we should try to bring out all the sweet fragrance in the childhood of our little ones.

Home is the haven of rest that is given us here, typical, they say, of the great home beyond the pearly gates. Be this as it may, the home here is nearest the throne, nearest to wearing a crown, that all good women may ever attain. Our homes are our kingdoms and should be ruled with a royal sceptre. Truest nobility is gentleness and love, a perfect woman, a noble man. The sacredness of home, the honor of woman, the love of offspring, hold society together now and give us all there is of happiness in life. Who would be willing to let fall one of the minutest threads that hold the loyalty of man to his own fireside, who could but honor him for his allegiance to his own family, who could but despise him for any lack of truth and honor that he could bring to its inmates.

Women should be the last ones to speak lightly of home, love or marriage. While she may be able to maintain her independence, to make all the money she wishes, be elected to fill the highest offices, there will be times, if she is truly a woman, when the friendly shelter of strong arms, the tender clinging of baby hands, the longing for a quiet nook in her own home, will be more to her than the wealth of the world.

*Irene.*

FORT WORTH, TEXAS.

#### CORPORAL PUNISHMENT.

---

I have been asked several times to give my opinion on corporal punishment. I consider this a grave question to handle; what would be applicable and necessary in the management of one child might be ruinous policy to adopt with another. The child's nervous temperament and physical health must be considered. Children are frequently born with deformed and unnatural dispositions.

The children whose parents are habitual tobacco users are usually born with nervous temperaments. The moral sensibilities of such children are sometimes blunted by the tobacco habit of the father. Whiskey may produce the same effect on some children, but I believe that it is an undisputed fact that tobacco smoking paralyzes the brain more surely than drink. Now the question arises, has the parent the right to inflict corporal punishment upon a child who is willful and disobedient, if the parent is, in part or whole, the cause of the child being born with an uneven temper or inclination to be stubborn and rebellious?

This brings up the question of who may and who may not be parents, but we will not discuss this at present; we are considering whether we may strike our child a blow. In answer, never in anger. We must govern ourselves before we can successfully govern our children and no blows should be inflicted until the laws of love and reason have been exhausted. It is an absolute necessity for the child's good that he be taught obedience, and who shall assume such responsibility but the parents. We, as children grown, are held responsible for our obedience to the laws of the United States. If we violate them we are punished, not by blows unless we are sent to the penitentiary, but some

form of punishment is meted out to us. Even criminals do not question the right of the law abiding citizens to punish the lawless man. If children are not taught to obey their parents is there not great danger that they will be troublesome citizens when grown?

In view of all these facts, if I had a child who would not obey me, after patiently trying every other means to control him, I would coolly, quietly and dispassionately spank him because I loved him and had his future welfare at heart. There are some children in my own city whose mothers I would like to spank. Children are to be pited who are born to parents who know no more about training them than a big mosquito does. The *Express*, which I have just been reading, contains an article entitled, "Killed by Bad Boys." A young girl teaching school had some bad boys in her charge. She appealed repeatedly to the school board for assistance, but as the board were the fathers of those bad boys, she did not receive it. She finally decided to take forcible action in the matter, and after a particularly bad outbreak, tried to use a ratan on one boy. He rebelled and other boys came to his aid and blackened the teacher's eye. That night she was found stretched across her bed dead, an empty vial of morphine lay beside her and in her hand this note: "I am tired of teaching bad boys."

Those boys needed corporal punishment badly. This is what the editor of the *Express* says: "Here are some boys who ought to be buried alive. That is, holes should be dug in the ground deep enough to let them in up to their necks, so they could be fed till they got old enough to know how to behave themselves. If hogs should come along and eat off their heads the world would be none the worse for it." And I would add, their fathers should be buried in front and facing them.

*Pebble.*

#### THE CURRENT COIN OF POLITE SOCIETY.

---

Whenever a kindly or considerate act is shown you, my dear, be always careful to say that magic index to good breeding—"Thank you." Certainly you say it to the man friend who has given you an evening of amusement at the theatre, or the concert, or who has taken you to and fetches you from a friend's home. To whom else should you say it?

To the maid servant who hands you your letters, who makes a special point of keeping your room in good order, and who, remembering that you liked certain things placed in a certain way, was careful always to do it.

To the stranger who holds open the door for you, to the elevator man who saves you climbing so many stairs, to the man who gives you a seat in car or omnibus, and to anybody, in any station of life, who shows you a courtesy of any kind.

We are apt to be very stingy with our thanks; to accept things entirely too much for granted, and to believe, in having courtesies shown us, that they are only what we deserve. Now this is the wrong way of looking at it, and some day it will serve that girl right—that girl who believes that the good things of life in the way of politeness are hers lawfully, and that without any effort on her part they can be retained, will discover her mistake. You can never be too generous with thank-you's; they are the current coin of polite society, the circulation of which tends to make everybody more eager to do unto others as they would be done by. No girl makes a mistake who has a thank-you always ready. It is the index to a good character and a loving heart. Politeness is golden, and thank you is the coin which passes everywhere and is recognized by all.

## LADIES' SOCIETY OF THE B. OF L. F.

In writing of the Ladies' Society of the B. of L. F. we cannot do better than introduce the following communication, addressed to the late convention of the order, held at Cincinnati:

*To the Third Biennial Convention, B. of L. F.:*

SIRS AND BROTHERS:—We, the representatives and grand officers of the Ladies' Society, would like to lay before you a few items in connection with our order. We are a little over one year old and have fifteen lodges in good working order with a total membership of about 308. We are very anxious to see a lodge organized wherever there is a B. of L. F. lodge, and would beg of you when you return home to use your influence with your wives, mothers, sisters and daughters to organize, and we will be only too pleased to send out the work and all necessary information.

Wherever there is an auxiliary, the B. of L. F. members know the benefit, and also the good it can and is doing.

We feel that much good can be done by your wives and mothers in regard to the young men of the order, by providing amusement and welcoming them into your homes, and we know the young men who are far away from their homes and friends would appreciate it.

We would also ask you to use your influence with the editor of the MAGAZINE to allow us space once a quarter, for our directory. Please give this your careful consideration. Thanking those members who have assisted us in the past, I remain

Yours in behalf of the Ladies' Society.

MAUDE E. MOORE, Grand Secretary.

The communication was accepted and adopted by the convention, and the request of the grand secretary of the society was ordered to be complied with.

Manifestly, a ladies' auxiliary society, in connection with the Brotherhood of Locomotive Firemen, could be and would be a force and a factor of great benefit to the brotherhood, as is set forth in the preamble of the society to its constitution and by-laws, as follows:

The Ladies' Society has been organized for the purpose of rendering assistance, and to encourage the Brotherhood of Locomotive Firemen in their good work, extending the hand of charity and helping each other in time of need, and to elevate our social and intellectual standing. It is the aim of our society to cultivate a spirit of harmony, to promote sociability, and to draw into friendly and affectionate relationship the lady members of the families of the brotherhood; hence we have adopted as our motto—

FRIENDSHIP AND CHARITY.

The MAGAZINE desires to express its unqualified indorsement of the Ladies' Society. It approves the aims and ends in view, and expresses the hope that a lodge of the society will be organized at every point possible throughout our entire jurisdiction. The women, God bless them, are ministering angels, loving and sympathetic, smoothing rugged pathways, drying tears, inspiring hope in hours of trouble and despondency. Their presence is light and joy amidst afflictions, and the Brotherhood of Locomotive Firemen ought to have and may have, by proper encouragement, for every lodge of the order, a Ladies' Society to help on every good work. Let the good work of organization go forward.

## NO MORE ACKNOWLEDGMENTS IN THE MAGAZINE.

Several pages in the MAGAZINE, in the past have been devoted to acknowledgments of various descriptions, which have only a local and individual value, about which the brotherhood at large takes no interest whatever.

Let it be understood, once for all, that the Brotherhood of Locomotive Firemen pays its debts promptly and in full, and there is no more use or sense in devoting pages of valuable space to recording the items that make up the sum total, than there would be in recording the fact that firemen pay their debts when due, and in giving the particulars.

These acknowledgments are stereotyped statements, made up chiefly of the same complimentary phrases, well enough in themselves, but neither necessary nor required in conducting the fiscal affairs of the order, and since they require space, which is virtually thrown away by publishing them, they will, in future, be discontinued.

## THE TEMPERANCE MOVEMENT.

MR. EDITOR:—Will you kindly allow me space to explain more fully to the many readers of your journal the real nature and objects sought in this White Button movement? It has been my good fortune in the last few years to be honored often with invitations to meet in lodges, divisions and in large union meetings of the various orders of railway men for the purpose of making familiar talks. The more I became acquainted with the workings of these orders,

the great good that was being done, the wonderful uplifting influences of the teachings of the rituals and the restraining power of the lodge and division rooms, the more I have become interested in the success and welfare of each of the orders with which I have been permitted more or less to mingle. The wonderful work they have done in elevating the *personnel* of their members has always been to me a matter of constant surprise and pleasure. Scarcely any topic touched upon by me in any of my talks before these men has ever received more hearty applause than that of the temperance work already done. "Sobriety" has become one of the cardinal words and doctrines of every class or brotherhood in the train service. No words can measure the good your orders have already accomplished in this direction. Will you and your thousands of readers pardon me if I come close home to each one and say I wish the orders would go up still higher? Almost the first page I turn to when your monthly journals come to hand (for you all honor me by sending me a copy of each) is the one that shows the suspensions and expulsions, and my heart aches as I read the names and the causes that lead to the dread necessity of the expulsion of a brother from either one of the orders. Often and over and over again have I asked myself, "Can not some way be devised by which these men can be saved to the brotherhood, to themselves and to their families?" This anxiety has cropped out in the free and easy talks I have had in our meetings, and as I said above, this point in every address I have thus far made before these railroad men has always been received with such hearty approval that I have felt that this feeling should be crystallized and made permanent in some way if possible. After much study and reflection this idea of the "White Button" suggested itself to my mind. Acting upon this I made a contract for 10,000 of these white railroad temperance buttons in May last. The next question was, how shall these buttons, meaning "Railroad Temperance Association," be distributed to the railroad men of this nation, and who shall wear them and what should it mean to wear one? After thinking it all over I came to the conclusion that it would not do to attempt to *sell* them, for soon it would be hinted that Mr. Coffin was on the make. The only way was to *give* them *freely* to every man in railroad service that would wear one in good faith, no matter how much it might cost me. This disposed of the first difficulty. The next question was, Who should wear them? Every man in railroad work who wanted his personal influence to make for temperance, especially among all railroad men, no matter whether the wearer had ever drunk a glass of liquor or not. The button on his coat says to every brother railroad man, whether of his own order or of another,

or of one outside, "My judgment is that railroading and liquor drinking do not mix well either on or off duty, and this white button says my advice is to every man to keep away from the saloon, and my influence by this white token is against drinking in every and all forms and at all times." This, then, shows who should wear the white button, and almost fully answers the last question, What does the wearing mean? But it means more. While as I most fully believe a great majority of all the members of each order are to-day practically thorough going temperance men, and are anxious to have every brother, both in and out of the brotherhoods be like themselves, yet we are compelled to confess to ourselves there are many who have for years, perhaps, been accustomed to drink moderately, but feel that they would like to quit, and resolve to themselves over and over again that they will. They see that the habit is growing upon them. Its chains are being wound around and around them until it seems almost impossible to refuse the invitation of a brother to take a social glass with him. Such men, as the scores of letters I receive from them from all over the nation, and from members of every order, say they want the white button on the lapel of their coat as a "reminder of the resolution formed," and as a signal given to a brother who would otherwise ask them to take something, that they are done. No real brother will ever ask a white button man to violate the good faith he has made with himself and every other railroad man in putting on this badge showing his principles.

May I not then ask if it is not the most reasonable thing for a temperance man in railroad work, who is a thinking, level-headed man, who has seen the dire effects that come from drink, to wear this at all times both off duty and on; this little white silent but potent monitor and pleader for the highest manhood, for home, for wife and for child? No one as well as you railroad men yourselves know of the positions lost, of the promotions checked, of the want and suffering to family that have come to many an otherwise grand and noble brother from this one cause alone. Could I not in truth go even farther and ask if any one outside of your own selves ever can realize the number of true, faithful, temperate men that have gone down under the awful crashings of collisions and wrecks that have had their initial point from a clouded brain caused by a drink too much of some brother on another train or in some position responsible for the action of trains? Then again. How easy it is when the poor, faithful, mangled man is dug out from under the wreck, for the officials to intimate that the responsibility for the accident rested with the man that now can not defend himself; that he was

under the influence of liquor. But who would dare do this if the white button of temperance was found on the crushed and shapeless body?

Would it not be a glad day to the railroad men of this nation if every man who is in any way in railroad work, and especially those who have any responsibility for the safety of trains, was heart and soul a white button man? The past year has been a fearful one to hundreds, yes, thousands of railroad men. Almost every day the press teems with accounts of wrecks and collisions. How many of these brave, faithful men have met their death through some neglect or misunderstanding of an order by others because they were not at their best, and this because of indulgence in drink? Perhaps none can ever tell. The standing rule on all time cards is, "In case of doubt take the safe side." In regard to drink we all know there is a safe side.

Now this white button movement is not from any outside pressure. It is one taken up by the railroad men themselves. Its success depends entirely upon them. There are earnest temperance men in every division, in every lodge and on every road. These men have the best good of their brother railroad men at heart. These men put on the white button and let it plead for temperance. They may not be very forward and free to say much, but the button speaks volumes. Most of these men will have an extra button or two to give to a brother who will wear one. This one becomes a silent missionary for the same good cause, and he will have with him also a few buttons to give to others who will wear them in good faith. Already, since May last, I have had 50,000 of these tokens made, and to-day over 40,000 are being worn by men in railroad work in every state and territory and in Canada.

I have estimated that it will cost me some \$5,000 or more to furnish these white buttons for the railroad men of this nation. I have already paid out \$1,300, and never was money spent more freely or willingly. As all know, I am not a rich man. What little I have has come from hard years of toil on the farm. I can spare the amount necessary to complete this work and still have enough to finish out the life that has already reached its three score and ten. I am only your servant, gentlemen and brothers, to furnish these white tokens that mean so much to every railroad man and to his family. There is not a man however true and temperate himself but is more or less in danger if a brother railroad man running against him on another train is in the habit of using strong drink, and this is why the expression just used has its force, viz: means so much to every railroad man and every such a man's family.

But I should certainly beg pardon for so long an article. I don't know when to stop

when on this subject. It means so much. Oh! the hundreds of poor fellows that drink has not only lost them their jobs, but the position lost, they have become discouraged and have gone down, down, and still down, until all has been lost.

Brothers! if indeed you will allow me to so address you, will you permit me to be your servant and helper in this matter? God knows, and I trust you all know, I have but one motive, one desire in all this work. I want to serve to the best of my ability the railroad men of this nation. Safety appliances on freight cars, Sunday rest and the blessings of temperance is not only the wish of my heart for every railroad man in America, but the object of the labor of what few days I may yet have on earth.

Most Respectfully,

*L. S. Coffin.*

FORT DODGE, IOWA.

#### THE CAUSE OF DEBT.

In the November issue of the MAGAZINE there appeared an article captioned, "Debts and Spot Cash," from the pen of "Pebble," of Murphysboro., Ill., which, I think, is worthy of the serious consideration of all laboring men. "Pebble" says: "Away back some where there was a first cause." I agree with her. There was a first cause; and as I see it, that cause is the superstition of intrinsic value in money. The laborer has been educated, all through the ages, by the idler to believe that nothing was money unless it possessed what the idler was pleased to call "intrinsic value"—that is gold and silver, because the idler thought these two commodities were scarce enough that he could control them and thereby control the value of all products. But lately silver is becoming more plentiful, and is losing its "intrinsic value" in the eyes of the idler. The dollar, regardless of the material of which it is composed, may be compared to a warehouse built to store labor and labor's products in. As evidence of this, the material in a silver dollar is more valuable than the material in a hundred dollar bill; yet the law says that one hundred times as much of labor's products may be stored in the bill as in the silver dollar.

The value of the material of which money is composed has no more to do with its monetary functions than the material of which a flour sack is composed has to do with the life-sustaining qualities of the flour contained therein. Now imagine an immense warehouse, reaching from the center of this continent to the Atlantic sea board, stored full of labor's products—wheat, corn, cotton, tobacco, beef, pork, etc., and all the business of the country to pass through that warehouse. Everybody is busy because there is room for everybody to work. On

one side of the warehouse the wagons can deliver the products of labor, and on the other side the railroads can receive and distribute them. Everybody is prosperous and contented; so much so, that as Hugh McCulloch said: "The people are too prosperous; we must contract the currency." What would you think of a government that would deliberately burn down such a warehouse with all of its contents, except just a little at one end? Thus enforcing idleness upon hundreds of thousands of men and making criminals of those who were formerly good citizens, because there was no longer room for all to stand around the little remnant of a warehouse, let alone working around it. You would think that was a mighty mean government, would you not? Well, that is just what our government did when it burned up those millions of greenback dollars; because every one of them was stored full of the products of labor. It went even further; it took the ashes of those greenbacks and built a huge warehouse for the idler class to collect rent off the wealth producer—a bonded debt—and as a result there has not been a child born in the United States since 1865 but what was born in debt, unless its father owned no property except government bonds. And Mr. Cleveland, when president before, recommended to congress the burning of the balance of the greenbacks, and the erection of more bonded debt. When the white men settled this country it was a wilderness with no debt over it, and the man who settled here has always produced more than he consumed, how has he been brought in debt? And to go a little farther, how has the man who produces all value, outside of natural value, been brought in debt to the man who never produces anything; not even enough to feed himself? Such is the case to-day in all civilized countries. I will answer my questions from my point of view, and if I am in error I shall be glad of correction.

My answer is: Interest money for private enrichment, or rent for the use of the warehouses which the law builds. Our dollars are costing us too much if we want to buy them, and too much if we want to rent them.

Porter's census statistics show over eight billions of dollars of real estate mortgages in the United States on record, and less than one billion of dollars in circulation. At an average rental of 8 per cent., each legal warehouse absorbs over .64 of its value in labor products on real estate mortgages alone, saying nothing of national, state, county, municipal or corporate debt. No state, county, nor corporation should be permitted to create a bonded debt; as such debt merely serves as a sponge to soak up the products of the wealth producer. The

sovereign power of the people, speaking through their mouth piece—congress—should create enough of these legal warehouses, called dollars, and rent them to the people at as low a rental as practicable; say 2 or 3 per cent., and all above the cost of creation should go to the government, thereby lessening the burdens of taxation. Then every man living under the government would receive his pro rate benefit from such rental. But the idle interest gathering class would fight such a proposition to the death, their laborious occupation of doing nothing would be gone, and that ought to convince the working man that it was in his interest, if he would only stop to think.

John W. Thompson.

SLATER, Mo.

#### THE N. A. S. E. AND THE LOCOMOTIVE BROTHERHOODS.

MR. EDITOR:—The January number of the *National Car and Locomotive Builder* contains a long editorial comment upon a series of articles that have been running for some time in the pages of the *Northwestern Mechanic*, relating the experiences of "A Tramp Engineer," in seeking and gaining admission to the National Association of Stationary Engineers. The *National Car Builder* says:

"The experience of 'Tramp' showed that the National Association of Stationary Engineers has for its objects not the agitation of grievances or the coercion of employers, but the improvement of its members. It may be said that the one healing and lubricating salve that it applies for all the different forms of friction between employer and employe, is education,—the self-education of its members in all those matters, a clear conception of which enables the user of steam, at sea or on land and in stationary or locomotive practice, to best utilize the elements that are in operation during the process of the generation of heat, by combustion, and the conversion of its force into useful work.

These are laudable objects, truly, and it would seem as though their consideration might furnish a theme that, of itself, could be enlarged upon in such a way as to inspire emulation in the minds of the members of all kindred organizations. But the editor of the *National Car Builder* is inspired by no such lofty sentiments. It is evident that he seizes the occasion solely for the purpose of drawing comparisons between the aims and objects of the N. A. S. E. and the Locomotive Brotherhoods. His comparisons are not only unjust to locomotive men, but they are singularly wanting in the element of truth, and that, too, with respect to matters upon which men in his position cannot be supposed to be ignorant. After describing the routine of one of the N. A. S. E. meetings, as taken from the experience of the "Tramp," the editor of the *National Car Builder* says:

"Those who are interested in the operation of locomotives can but wish that the meetings of the Brotherhood of Locomotive Engineers had more of

the character of those described above than, as is the case of aggressive labor agitation. The field for improvement is wider with the locomotive man than with the stationary engine man, and his daily opportunities to economize are much greater; but this is appreciated but by a small proportion of locomotive engineers, and there is no indication of even a contemplated improvement.

"The opinion was recently expressed by a prominent superintendent of motive power that the whole system of promoting firemen to operate locomotives ought to be changed, and educated men trained for the positions instead. The reason assigned was that to obtain the best results in locomotive operating, engineers are needed with, not only judgment enough to do their work safely, but with intelligence and education enough to broadly and clearly comprehend the principles of steam engineering, as they apply to the economical management of the locomotive; and that not only do the laborious duties of firing necessitate the employment of men for firemen who have muscle rather than intelligence and education, but the influence of associates and the labor organizations they join retards or prevents their self-improvement. While it is not likely that such a change as that proposed will be inaugurated at once, it is yet a warning to both locomotive engineers and firemen that some master mechanics are beginning to regard the present standard of their efficiency as quite unsatisfactory, and the exhibition of their intense labor unionism, and their apathy to means of self-improvement and the interests of their employers as not encouraging."

The foregoing is as gross a tissue of misrepresentation and falsehood as it is possible for it to be, and I have a strong suspicion that the writer knew it to be such. It is not within reason that the editor of a journal, which is specially devoted to railway interests, should be ignorant of the vast improvement that has taken place in locomotive men within the past fifteen years, and that, too, with respect to those matters wherein it is assumed there has been no improvement.

A more faithful, efficient, intelligent, and well instructed class of enginemen than the locomotive men, is not to be found in any branch of steam engineering. The improvement, with respect to all those qualities that go to make up the thorough engineer, in locomotive enginemen has been so marked within the last two decades as to excite almost universal comment, and yet we are told that "there is no indication of even a contemplated improvement." Twenty years ago locomotive enginemen were, as a class, a reckless, roystering, intemperate, and uneducated set of men, social outcasts, shunned and ignored by self-respecting persons, mere stoppers and starters, with no ideas regarding the economical management of their machines and but the vaguest and most poorly defined ideas concerning their construction. To-day they are sober, industrious, self-respecting, and respected, with a thorough knowledge of their business, a just appreciation of economical methods, and a disposition to apply them to the fullest extent consistent with the conditions of the service. The most important factor in bringing about this vast improvement in locomotive enginemen has been these very

labor unions which we are told retard or prevent their self-improvement. The brotherhoods are nothing if not educational in their aims. Their efforts have ever been to raise the standard of efficiency among their members to the highest possible point. Their motto has ever been a good day's work for a good day's pay. The interest manifested in the discussion of those matters pertaining to the successful management of their business, through the columns of their official journals, is proof positive that locomotive enginemen are not apathetic. The character of the publications which they support by their subscriptions, and the vast sums which they annually expend for books on engineering subjects go to show that the men are not insensible to the means of self-improvement. But the editor of the *National Car Builder* knows all this. He has only been compelled to resort to misrepresentation, in order to find a valid excuse for deprecating that spirit of intense "labor unionism," as he terms it. Is it possible that he is ignorant of the fact that a spirit of intense labor unionism is the only salvation for workingmen, as long as present industrial conditions continue? Is he so unfair as to wish that the employers of labor shall have the right to form pools, trusts, and combinations for the protection of their interests, while refusing the right of employes to do the same? Is he so economically ignorant as to be unable to perceive and appreciate the fact that the labor union is but a natural development from unnatural and unjust industrial adjustments? The labor union has a natural place in our industrial system, and as long as we aspire to continue our productive industries upon the present lines the fact must be recognized: there is no way to evade it. Workingmen do not pay vast sums for the support of their unions any more than capitalists pay vast sums for the support of their combinations, for the fun of the thing. They do it because they are compelled to do so as a measure of self-defense. Labor unions are the most effective engines yet discovered for the protection of the laborers' interests, and the only thing to be regretted in connection with them is that the spirit of intense labor unionism, which the editor of the *National Car Builder* deprecates, is not more fully developed. When the necessity for the existence of labor unions shall no longer be apparent there need be no anxiety but they shall disappear.

Does not the editor of the *National Car Builder* know that the soundness of the trade union principles is admitted and endorsed by all well instructed economists of the day? Therold Rogers makes the very just remark that "it is the business of particular crafts of workmen to sell their labor at as good a price as they can. They never have ruined

and they never will ruin the capitalist employer by the process, for they may be trusted not to ruin themselves, since they are quite as acute as their employers in discerning what price the market will bear."

The brotherhoods neither seek to excuse nor condone incompetency or inefficiency among their members, but are quite as ready as are the railroad companies to insist upon the highest degree of efficiency possible or attainable, and I imagine the policy will be continued without sacrificing any of their union principles in the meantime. I do not believe that the brotherhoods stand greatly in need of the advice of the editor of the *National Car Builder* with respect to the conduct of their organizations, and I am of the opinion that it would be good policy on the part of those persons who pay him for his editorial utterances to see that he gets a few kindergarten lessons in economics before allowing him to embark in a crusade against the trade union principles.

*Wilfred P. Borland.*

#### RIGHTS AND DUTIES OF FIREMEN.

MR. EDITOR:—In reading "Main Track's" article, which appeared in the December MAGAZINE, I understand him to say that firemen have no rights, but have to take just what they can get or what the engineers see fit to give them.

Now, I do not know what part of the country "Main Track" comes from, and it may be so where he is employed, but I am glad to say that here in the western states, such is not the case.

Here firemen have equal rights with the engineers, and do not have to be recommended by them for promotion, or for choice of engines and runs. The time is past and gone when engineers may choose their firemen or make a kick on a fireman and have him pulled off from an engine, just because he don't happen to dance to the engineer's music at all times or keep everything polished up in first-class style regardless of hard runs or want of rest. And here let me say that the high-minded round-house foreman, on this system at least, the A., T. & S. F., has been relieved of one of his most exalted duties—that of placing men on engines. Here the men make their own assignments to engines and runs, and Mr. Foreman is simply "not in it."

There are, no doubt, some firemen who depend too much on their engineers, and look up to them as models of perfection, but these are the exception, not the rule. The more we depend on ourselves and show to others that we have confidence in ourselves, and minds of our own that will not permit us to tag along at the coat tails of others, the more will we be respected and our rights considered.

No true brotherhood fireman will ever shun a brother simply because he happens to be out of employment, and anyone that will do such a thing is not worthy the name of fireman.

I am not in favor of B. L. F. men who are engineers, acting on our adjustment boards, after they have become engineers and eligible to the B. L. E. Their interests are not the same as before, and no man will consciously work against his own interests. I am unable to see where the engineers would have any advantage over us in federation, if we were federated upon an equal basis; one would certainly have as much to say as the other.

*O. N. Carpenter.*

WELLINGTON, KANS.

#### A SERMON FOR THE BOYS.

MR. EDITOR:—For the past five years it has been my privilege to live in a home where the MAGAZINE is a regular visitor and to say that I have perused its pages with interest is to express it lightly. This forenoon I spent in reading the December number, and it occurred to me that I might, through the pages of the MAGAZINE, express a few thoughts to the boys which would be worth their while to consider. For five years I have been intimately acquainted with a number of the boys, and for over a year I have been one of their number and I find that, with a few exceptions, they are a good-hearted, honest lot of boys, and, but for a few habits which most of them have formed, might be classed with the best in our land.

It is hardly necessary to state what those habits are, yet lest someone should make a mistake, it might be well to mention some of them. I will mention but two or three, viz: gambling, sipping of the flowing bowl and visiting fast houses. These, together with a lack of interest in spiritual matters, place us, as a class, outside the pale of the very best society, and almost forces us to find our amusements in second-rate places. I say almost forces us, but I do not think that it quite forces us, for, as individuals, we may find good society if we do not and will not associate with the bad. I see no reason why a railroad man may not be a gentleman and a Christian. I have oftentimes wondered why the boys acts as they do, for, as a majority, they are bright, clever, shrewd fellows, and both see and acknowledge that they are acting foolishly. The good book says: "Why spend ye your money for that which is not bread, and your labor for that which satisfieth not." I think that if those words mean anything they mean those habits which I have referred to, and if any of the boys can give a good, sensible reason why they cultivate

those habits, I would like to see it in print; for then I will know something which, heretofore, has been a mystery to me.

Think of it, boys; is not yours all loss and no gain? But, some will say, "we often gain." I will grant that sometimes you gain a few dollars at the gaming table, but you often lose a few dollars in money; and you always lose something more which cannot be purchased with money. But oftener you lose both money and character. And, not only that, but gambling leads to drinking, and drinking to all kindred vices. Think, boys, to what extent the damage goes, and you will at once acknowledge that the cost overcomes the profit. You not only are sapping out the noblest part of your own manhood, but you are placing a scar upon the virtue of your brother, and on the generations which may follow.

I would that you would not only think upon it, but that you would act according to your best judgment and say: "From henceforth I will not spend my time, my money, nor my manhood for such things, but will strive with all my energy, and by all the help I can gain, not only to better my own condition, but also to help my brother to rise to the highest possible attainment." I have no doubt but before the year goes by you will be thankful a thousand times for the effort. This, the beginning of a new year, is a good time for such thoughts and resolutions. It will be easier to act now than it will be a year from now. "Now is the accepted time; now is the day of salvation. To-day if you will hear My voice, harden not your hearts."

W. T. Nicholson.

GRAND FORKS, N. D.

#### A RATIONAL TEMPERANCE LECTURE.

MR. EDITOR:—Three years ago I exchanged the black and greasy overalls for one of Uncle Sam's grey uniforms, and the pick and scoop for one of those well known and often anxiously awaited mail sacks, whose mysterious depths contain the secrets of both rich and poor, and which are often the bringers of sad news as well as glad tidings. The railroad fraternity is well represented on my route and I handle many of the *MAGAZINES*, as well as the *Engineers' and Trainmen's Journals*. It is difficult for an outsider, who is unacquainted with the interior workings of the great railroad systems, to realize what an amount of benefit has been derived from these unpretentious little books, by the hard laboring railroad man.

Many have profited by the advice found therein, and have found employment for their leisure moments, which would otherwise have been spent in the saloon; and which, I am sorry to say, is the only place in most of our railroad towns offering com-

fort to the unmarried fireman or brakeman when lying at the end of a division waiting to get out. I am not an advocate of prohibition, nor do I think the *MAGAZINE* should pose as such. I know from experience that a drink of good whiskey, after throwing coal into a consolidation, or ever hungry ten wheeler for fifteen or twenty hours will harm no one; but I also know from experience that the shorter one makes his stay in the average saloon the better it will be for him.

The little town I fired out of was a typical railroad town, and the only choice we had on a cold day was the round house or a saloon; and many a dollar was recklessly and unnecessarily spent there by rolling the bones, and setting them up, after having toiled for many a weary mile, and lost many a night of nature's sweet restorer in order to get them, not to mention the risks and dangers so closely allied to our calling. It is for this reason, mostly, that I would say a few words to the boys and ask them to give my proposition careful attention. Why do not the many lodges of the different railroad organizations provide a suitable place where their members can find a temporary home during their idle hours?

The cost of such would be a mere trifle, compared with the immense amount of good it would do. There they could, for a few dollars, have the choicest reading matter, such as *The Scientific American*, *Locomotive Engineering*, *Harpers*, and other periodicals which have helped to advance the American workingman. Then there are, undoubtedly, many who take interest enough in railroad men to contribute books and newspapers, and as I have quite a lot of them myself, I am willing to send them to any one applying for them for such a purpose. A start might thus be made toward establishing a library somewhere.

The time has passed when it was sufficient to know how to start and stop an engine to be called an engineer, and the demands made by most of our great railroads upon the intelligence of their engineers are becoming more exhaustive every day. So that it is only by self-education that we can advance ourselves, not by shaking dice or ornamenting the floor of some saloon with tobacco juice. I do not wish to be misunderstood. A pipe of tobacco is all right, so is an occasional drink; but go in, get what you want and come out again; and above all, don't have anything chalked down. Then when the pay car comes your hard earned money will be your own, and instead of the saloon keeper wearing fine clothes and hand sewed shoes, you can wear them yourself. Once a man becomes accustomed to good reading, he will ask for no better way to pass his spare time, and what nation on earth has a better choice of good and cheap reading matter than ours has? I have

a great deal more to say on this subject, but I do not wish to overtax the patience and space of the editor. My advice is well meant and I speak from experience, and I will write again if I find my letters are welcome.

*Frank S. Krebs.*

#### ROUND HOUSE AND STREET TALK.

MR. EDITOR:—Although there has been a great deal said on the subject, and members have been cautioned about it through the columns of the MAGAZINE, some will still persist in discussing lodge business in the round houses and on the streets. In a great many instances, the wipers in the round houses and little boys on the streets seem to know and understand all about the business of engineers and firemen, and trainmen too, for that matter. If there is a seniority question to settle, about the first thing you can see is a crowd of engineers and firemen collect on some street corner and commence to discuss the merits of the case. This naturally attracts some attention, and people passing by begin to stop and inquire the cause of so heated a discussion. People who never worked on a railroad a day in their lives, and who perhaps never knew there was such a thing as seniority among railroad men, can, by listening to one of these free-for-all debates, become as well acquainted with our business as we are ourselves. Now, boys, did you ever see a lot of business men in your town congregate on the street corners and argue about what they were doing or intending to do? My answer is that you did not. They settle those matters among themselves on the quiet, just as we should do—have our talks in the lodge room; it is the only proper place for them. Again, on most roads it is the custom for engineers and firemen to make their own selections of engines and runs, and to govern their seniority to suit themselves, the railroad company having nothing to do with it at all. Each lodge has its local board of adjustment, and the chairman of this board assigns all men to engines in their regular order. Notwithstanding this, there are engineers and firemen who, when they imagine they are not getting their rights, instead of putting their case before the committee, go to the round house foreman with their troubles, when they know he can do nothing for them, and it is none of his business one way or the other. Now, boys, let us see if we cannot do better with respect to these matters in the future than we have in the past; we can treat our fellow men with courtesy and respect without taking them in as side partners in our business.

Now, I would like to have the opinion of some of the boys on another subject: Most contracts between enginemen and railroad companies read that "all trials of enginemen for accidents and misconduct shall be held within sixty days after the offence,

before the division superintendent, the division master mechanic, and one disinterested engineer or fireman, as the case may be."

On this road, the A., T. & S. F., the master mechanics have, in a number of cases, authorized the round house foreman to act for them. Now, is this right, or is it not? For my part, I am not in favor of it. First, because it is a variation from the schedule, and if you allow a variation on one point you must on another. Second, because the foreman is, in a good many cases, what I call incompetent to act. The probabilities are that he has not had the experience of a master mechanic in railroad work, and is not a fit man to pass judgment upon men who have spent years on the road. I would like to hear from some one else on this subject.

WELLINGTON, KAN. *C. N. Carpenter.*

#### WHY WE HAVE BACHELORS.

MR. EDITOR:—I am a reader of the MAGAZINE, and noticed an article in the August, 1892, number, from the pen of Miss Grace B. Cutler, advocating the taxation of bachelors. When I read Miss Cutler's article I agreed with her, but I noticed an article in the January MAGAZINE from a poor old bachelor in Fort Madison, Iowa, who tries to apologize for being one, and taking this article in connection with some circumstances of the telegraphers' strike on the C., R. I. & P. R. R., I was induced to change my opinion. I am a fireman on the southwest division of the "Rock Island," and I noticed that a large number of the offices made vacant by the striking operators were filled by women, who worked for \$30 per month. Who would not be a bachelor? No man can marry, and support a family, on such wages. Miss Cutler says to tax the bachelors. Well, perhaps they are better able to pay a tax than the old maids would be, especially the one who took the one-armed operator's place on the Rock Island.

Now, I do not think telegraph operators are worse than others—typewriters, clerks, school teachers, and all other women who do a man's work for less than a man can afford to do it, are working against their own interests and the interests of their country. If a man marries one of these girls, how can he support her and himself on a salary of \$30 a month? I think those girls are more to blame for men being bachelors than the men are themselves. Most of these \$30 girls have no one to work for but themselves, and of course can do very well alone. They wear their \$30 out every month in dress, and if they see some poor boy, whose parents couldn't dress him well, they say "My goodness! look at that ragged little kid! don't let him touch me, he'll soil my clothes." Perhaps these little fellows' fathers could keep their children in comfort if the girls did not set the standard of wages so low. *M. Crowley.*

## GRAND LODGE.

## ASSESSMENT NOTICE FOR MARCH.

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., MARCH 1, 1893. }

ASSESSMENT No. 36, \$2.00.

*To Receivers of Subordinate Lodges:*

SIRS AND BROTHERS:—You are hereby notified of the death and disability of the following members entitled to all the benefits of the order, viz:

CLAIM No. 917. Wm. R. Vaughn, of New State Lodge, No. 343, died of Cancer, November 14, 1892.

CLAIM No. 918. Cornelius Cavanaugh, of Harbor City Lodge, No. 300, was killed by Boiler Explosion, January 3, 1893.

CLAIM No. 919. Chas. Hottinger, of Emerald Lodge, No. 437, was killed by Railway Accident, January 8, 1893.

CLAIM No. 920. William N. McCarthy, of Spartan Lodge, No. 2, died from injuries received in a Boiler Explosion, January 5, 1893.

CLAIM No. 921. Orson Tout, of Clark Kimball Lodge, No. 113, was killed by falling between Engine and Tender, January 6, 1893.

CLAIM No. 922. Joseph H. Blackwell, of Black Hawk Lodge, No. 114, died of Typho-Malarial Fever, January 12, 1893.

CLAIM No. 923. James B. Clark, of Saginaw Valley Lodge, No. 286, died of Consumption, January 13, 1893.

CLAIM No. 924. Andrew D. Allison, of James Leahy Lodge, No. 475, died from injuries received in a Railway Accident, January 13, 1893.

CLAIM No. 925. Hugh P. Mitchell, of Black Hawk Lodge, No. 114, died of injuries received in a Railway Accident, January 14, 1893.

CLAIM No. 926. Harry M. Long, of Cold Springs Lodge, No. 360, was declared totally disabled with Spinal trouble, January 14, 1893.

CLAIM No. 927. Andrew Hogan, of W. F. Hynes Lodge, No. 48, was killed by being Crushed by Coal Hoist, January 16, 1893.

L F M 6 Mar 98

CLAIM No. 928. Maurice Crowe, of S. M. Stevens Lodge, No. 150, died of Pneumonia, January 21, 1893.

CLAIM No. 929. Edward R. McCosh, of Anchor Lodge, No. 84, was struck by Coal Chute and killed, January 22, 1893.

CLAIM No. 930. James B. Campbell, of Canal City Lodge, No. 255, was killed by Railway Accident, January 22, 1893.

CLAIM No. 931. Arthur W. Thompson, of Rickard Lodge, No. 229, was declared totally disabled by Lung Trouble, January 23, 1893.

CLAIM No. 932. Edward F. McGrath, of Faith Lodge, No. 200, was killed by Railway Accident, January 25, 1893.

CLAIM No. 933. Matthew Reisinger, of Rochester Lodge, No. 99, was killed by Railway Accident, January 27, 1893.

CLAIM No. 934. Jno. Gartner, of Scioto Lodge, No. 202, died of Tuberculosis, January 28, 1893.

CLAIM No. 935. Robt. W. Wilson, of Avon Lodge, No. 38, died of Heart Failure, January 28, 1893.

CLAIM No. 936. Frank Tirney, of Plain City Lodge, No. 238, was killed by Railway Accident, January 28, 1893.

CLAIM No. 937. Axel Borkland, of Just In Time Lodge, No. 149, died of Desquamative Nephritis, January 30, 1893.

CLAIM No. 938. Melvin S. Laughlin, of Kaw Valley Lodge, No. 313, was killed by Railway Accident, February 4, 1893.

An assessment of TWO DOLLARS (\$2.00) has been levied for the payment of the above claims, and you are required to forward said amount for *each member* whose name appears on the rolls of membership MARCH 1ST, 1893, (also for all members having taken a withdrawal (limited or final) after FEBRUARY 1ST, and for all members who died or were totally disabled since that date), said remittance to reach the Grand Lodge not later than MARCH 20TH, 1893, as provided in Section 50 of the Constitution. Any lodge failing to make returns as above provided will stand suspended from all the benefits of the order, as per Section 52 of the Constitution.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

## ADDRESSES WANTED.

DAN. DINNEEN—Formerly a member of J. M. Raymond Lodge, No. 49, Decatur, Ills. Any one knowing his whereabouts will please communicate with his sister, Mrs. M. Leach, 453 Duncan Park, Ills.

CHAS. A. CLARK—When last heard from, about a year ago, was employed on the D. & R. G. W. Ry., out of Salt Lake City, Utah. Any information in regard to him will be thankfully received by O. M. Losey, Box 228, Asheville, N. C.

## BENEFICIARY STATEMENT.

OFFICE OF GRAND SECRETARY AND TREASURER, }  
TERRE HAUTE, IND., February 1, 1893. }

To Subordinate Lodges:

SIRS AND BROTHERS:—The following is a statement of the Beneficiary Fund for the month of January, 1893:

## NEW ADVERTISERS.

Our readers will observe the constant growth of our advertising pages, all of which speaks well for our MAGAZINE and its value to advertisers. Don't forget to give the MAGAZINE its due when answering any of these ads. We mention the new ones with this issue as follows:

Peter Henderson, Seed House.  
Reliable Incubator Co.  
U. S. Metallic Packing Co.  
Mrs. Winslow's Soothing Syrup.  
American Nation.  
Mason & Hamlin's Pianos and Organs.  
Dr. Scott's Safety Razor.  
National Tube Works Injector.  
Fahy's Watch Case Co.  
Farrand & Votey Organ Co.  
World's Fair Encampment and Hotel Fraternity.  
J. C. Paul & Co.  
Bernhard Meuser.  
M. A. Whitney.  
Standard Silverware Co.  
Meeker Medicine Co.

AN up-town magistrate said last evening that for several days there has been a noticeable falling off in the number of drunken men brought in at the various police station-houses. He gave it as his opinion that this charge is explained by the near approach of the license court's session. Saloon keepers, he said, are on the lookout for men who come in partially intoxicated and will not allow them to have anything strong to drink, fearing that it may operate to their disadvantage.—*Philadelphia Record*.

SOME striking points of coincidence in the lives and deaths of Spurgeon and Bradlaugh are pointed out by a London journal. Both died of Bright's disease at the age of fifty-seven. Both were men of the people, absolutely sincere, entirely fearless and born orators. Mr. Bradlaugh began to speak in public at seventeen, and so did Mr. Spurgeon. Each was partial to cigars; each was a teetotaler. Mr. Bradlaugh expired on January 30, 1891, and Mr. Spurgeon on January 31, 1892.

## EDITORIAL.

---

### CONGRESS, PINKERTONS AND ORGANIZED LABOR.

---

The senate of the United States appointed a select committee to investigate and report to the senate the facts in relation to the employment, for private purposes, of armed bodies of men or detectives in connection with differences between employers and employees.

This select committee has made its report, which shows that the committee examined fourteen different witnesses on the thug side of the question, including the Pinkertons themselves, and with regard to the Homestead infamy, the part played by the thugs, H. C. Frick, the murderous monster and pimp of Carnegie, and Bob Pinkerton, were examined, and eight other witnesses. The committee, in examining questions directly bearing upon labor and labor strikes, called in seventeen witnesses. Four witnesses were examined upon questions relating to the power of the courts to interfere to prevent labor strikes, and fifteen witnesses were examined upon the subject of arbitration and other matters of inquiry proper for the committee to pursue.

The investigation led to the admission, on the part of the Pinkerton brothers, who hire, organize, arm and equip the thugs, and then supply Carnegie, Frick and others of their ilk, with as many murderers as they demand to kill workingmen, that the presence of these thugs served to unduly inflame the passions of the men who strike

against oppression and degradation. There are, it was ascertained, in the ranks of the thugs, trained spies, who, assuming to be mechanics, enter the ranks of the strikers, and, obtaining information, report to employers and thereby enable them to *spot* and discharge certain men who dare protest against outrages, and thus make it possible for scabs to obtain the places of honest workingmen.

Having obtained such information from the two brother Pinkertons, whose names stand for as much infamy as fell to the lot of Judas Iscariot or Benedict Arnold, or any other villains our corrupt civilization has spread upon society, the committee reached the conclusion that if corporations would discontinue the employment of Pinkerton thugs on occasions of threatened or existing strikes, their interests would be better subserved.

The committee also reached the conclusion that the employment of the Pinkerton thugs at Homestead was "unnecessary." Prior to the introduction of the thugs by Frick, the committee found that "not the slightest damage was done nor attempted to be done to property on the part of the strikers." Hence, it may be inferred that the passions of the strikers were inflamed by the introduction of a gang of armed thugs, ready and willing to murder the strikers at the word of command, and that they did not murder hundreds of them in the interest of Carnegie and Frick, is a mystery, unless it is explained by the heroic determination on the part of the strikers to sell their lives as dearly as possible; a resolution that brought the thugs to terms, and sent them, for the first and only time, defeated and crushed, without having accomplished their murderous mission.

The committee, in its deliberations, reached the following conclusions:

1. Rights of employers and workmen are equal.
2. Employers have an undoubted right, provided they fulfill their agreements, to employ and dismiss men at pleasure.
3. Workmen can legally organize for mutual protection and improvement.
4. When dissatisfied with wages or hours, they should attempt to arbitrate.
5. Failing in this, they have a right to discontinue work, either singly or in a body.
6. Having discontinued, they have no right, legal or moral, by force or intimidation, to keep others from taking their places, or to attempt to occupy, injure or destroy the property of their employers.
7. In all controversies, arbitration having failed, reliance should be placed upon the power and adequacy of the law.

8. Whether assumedly legal or not, the employment of armed bodies of men for private purposes, either by employers or employes, should not be resorted to, and such use is an assumption of the state's authority by private citizens.

9. States have undoubted authority to legislate against the employment of armed bodies of men for private purposes; but the power of Congress to so legislate is not clear, although it would seem that Congress ought not to be powerless to prevent the movement of such bodies from one state to another.

In the foregoing conclusions, Nos. 1, 2, 3, 4 and 5 are those which will attract the most attention. The equality stated in No. 1, as matters stand, is totally misleading—the rights of employers and employes, only in a restricted sense, are equal—and this is seen in conclusion No. 2, in which it is glaringly shown that the employe has no rights whatever; the right to hire and the right to discharge an employe is placed absolutely in the hands of the employer, the employe is not consulted at all. He may be discharged for any cause which the whim or malignity of the employer may suggest, and according to this senate committee, he has no redress; his work, his means of living, are taken from him, and he is forthwith remanded to the ranks of the idle, and he may go to the devil for aught the employer knows or cares; hence, we ask what becomes of conclusion No. 1?

Does some one say that conclusion No. 3, which asserts that "workmen can legally organize for mutual protection and improvement," provide any remedy against conclusion No. 2? We answer, none whatever, because, conceding the absolute *right* of the employer to discharge an employe, any protest on the part of organized labor to remedy the outrage, would be interfering with a conceded *right* of the employer.

To illustrate, A. has a legal right to join a labor organization, but for the exercise of this legal right, B., the employer, according to conclusion No. 2, may discharge A. "at pleasure," and thus it is seen that while the equality of "employers and employes" is asserted, the equality is a sham and deception, having no practical existence, so far as the conclusions of the committee are concerned.

To establish conditions in some measure approaching equality, has been the earnest effort of organized labor. As for instance, A., an employe, is discharged. Just here organized labor comes in and asks of the employer, Why? and insists that A. shall not be discharged

without a hearing, something in the form of a trial; that he shall not be set adrift to gratify the spleen of some parasite, and made to suffer penalties innocently. If the committee had suggested something of this sort, something to check the meanness or venom of underlings, it would have been far more creditable than the one-sided conclusions the committee reported. The other conclusions are a series of old chestnuts, which it were a waste of time and paper to discuss. There is just one way out of the woods for organized labor to pursue, and that is to go forward pleading the cause of union, federation, united and compact organization and action, to create a bond of union so strong that unity will be secured when there is a conflict between right and wrong, truth and error, and to force the fight into legislative halls and to never cease the struggle until there shall be, in fact, in reality, truth in the declaration, that the "Rights of employers and employees are equal."

---

## A WORKINGMAN'S CONGRESS.

---

The MAGAZINE propounds the question: Would a workingman's congress be a move in the right direction? If not, why not? What can be said in favor of such a movement? Is the time ripe for it? What could it do if convened?

Just now, what would be a move in the right direction for workingmen to make? We refer to organized workingmen, for they are the workingmen who think, who want to accomplish something for their own benefit and for the toilers who shall inherit their tasks.

We do not now discuss the federation of organizations, but, rather, the unification of the mind forces of organization; deliberation, rather than federation.

True, all organizations have their annual or biennial conventions for deliberation and for the enactment of laws for their government, and it occurs in these conventions that those whose expressions are made public are taking ever broader views of labor problems, and it

would be difficult to chronicle a fact more creditable to the heads and hearts of men who have advanced to the responsible position of leaders.

It is worthy of remark, that in all the labor organizations of the country are to be found men of broad and liberal views, students of industrial affairs, profoundly interested in the welfare of workingmen, but forever confined to their particular organization, they are handicapped; they never advance to their full measure; in a sense, fenced in. They discuss measures which relate to their particular organization, when in fact, labor questions in their legitimate scope, touch the wage workers of the nation, and in a labor congress there would be opportunities to bring into commanding and merited prominence, labor questions in which all are vitally interested.

We are profoundly impressed with the idea that the country cannot know the wealth of mind forces which labor possesses, until a labor congress is convened, and we are quite as much persuaded that such a congress would prove a revelation to those who regard labor organizations with a species of contempt and lofty disdain, as composed of men who are small intellectually and whose minds are chiefly occupied in accomplishing small things, men chiefly desirous of promoting organized jealousies, of feathering their own nests, to be wiped out of existence whenever organized capital deems it prudent to squelch them.

We do not state the position of affairs too narrowly. It is only required to read the monopolistic press to verify our declarations. In it you will find no complimentary declarations relating to organized labor, and the question arises, is organized labor doing those things which ought to be done and which can be done, to change the estimate which a subsidized press ceaselessly puts forth?

We are not opposed to what organized labor is doing. On the contrary, we have only words of commendation for what we see and hear. Labor Day gives opportunities for parades, for many and valuable recreations, splendid addresses, etc., but we advocate something different, better, higher, more important. We should like to see a stately parade of labor's mind forces, free from badges, gewgaws, brass bands, and all things spectacular; a labor congress of labor's intellectual men debating questions which, day by day, are becoming the vital questions of the times in which we live; questions that are up

for debate in the parliaments of the world, and in which labor, more than any other interest, is concerned. Such a congress, composed of labor's representative men, would arouse continental interest. The press would not and could not ignore it. The plutocratic class would stand amazed in its presence. It would be a proclamation that workingmen know their rights and are not ready to be enslaved. What says the labor press of the country? The labor congress proposition is up for debate. May we hope to have the views of others?

---

## LAW, LAW-MAKERS AND POLITICS.

---

The government of the United States is based upon constitutions called organic law, the foundation for all statute law. Every state in the Union also has a constitution which must conform to the provisions of the Constitution of the United States. The constitution making power is lodged in the people. It is this fact that proclaims and establishes the sovereignty of the people.

If there is anything wrong in the constitution of the republic or in the constitution of a state, it is the high prerogative of the people to abolish the wrong. A constitution may be amended by the people or abolished by the people. The people constitute a sovereign, all-pervading power. The theory is, that in making and amending constitutions, a majority rules; but constitutions, in their provisions protecting all the people alike, guard the rights of minorities from encroachments by majorities, since majorities, like autocrats, if not restrained, become arrogant and oppressive.

Notwithstanding such guards and limitations, majorities often transcend such defences and securities, which brings into action another shield against congressional and legislative arrogance, known as the "veto power," a power lodged with the chief executive of the republic and of the states, which forbids the enactment of a law designed to work wrong to the people. In such cases, the veto is generally effective, since it requires a two-thirds vote of both houses,

either of congress or a legislature, to enact the law, though in some cases only a majority is required to set aside the veto, and in some of the states the constitution does not give the chief executive the veto power, holding that the will of the majority ought, of right to be supreme.

There is also provided in all constitutions another safeguard against the operation of laws which strike down the rights of the people. This power is lodged in what is called the Supreme Court, where, under certain forms of procedure, an unconstitutional law may be abrogated, and multiplied instances of such decisions of supreme courts are annually recorded. Nevertheless, after the most critical disquisitions upon constitutions, it is found that the latitude given law-makers has extraordinary sweep, and, as a result, under the operation of such powers, laws are enacted, which strike down, under the decisions of the courts, the most sacred rights of citizens.

It would seem practicable to frame laws in such simple and easily understood language, that "a wayfaring man, though a fool," might comprehend their meaning, but it so happens that laws touching great interests are so framed that only lawyers are able to solve their mysteries, and to the average man they might as well be written in Coptic as in English. In such laws, when the fee warrants the hunt, a provision, a technicality, a word easily tortured to mean anything or nothing, as may best suit the interests of the rich and powerful client, is found, which often befogs judge and jury, so that brazen rascality goes unscathed while innocence, left to contend against such laws, receives the stamp of infamy. The records are burdened with such cases, the laws being so constructed, that as a net, the whales go through unharmed, while minnows are caught, or upon the principle of the man in search of game, and having doubts in a certain case whether he saw a deer or a calf, fired so as to miss it if it were a calf, and kill it if it were a deer.

All men are interested in the laws of the republic, state and national, because they are the subjects of law, their lives are, in a large measure, regulated by law—law touches their interests at a thousand points—therefore since politics is the science of government and government being based upon laws, every citizen, and none more than workingmen, has a profound interest in politics, an interest from which only cowardice or debased ignorance could, by any possibility

absolve them. It is here that the sovereignty of the people comes prominently into view. It is here that the ballot becomes the bulwark, the palladium of men's rights, their liberty and their independence. It is not a partisan question, only in so far as men discover that one party favors just laws and their honest administration, more than another party.

Such reflections are in line with the efforts of labor just now, to secure the enactment by congress and by legislatures, of certain laws designed to place workingmen's interests on a level with the interests of capitalists; hence, there are in every state, labor legislative committees presenting bills and asking the representatives of the people to enact them into laws. These committees ignore parties and work to enthrone principles. They present to law-makers, conditions of long standing, in which they demonstrate by facts, that flagrant wrongs exist; as, for instance, they show that in the operation of railroads, thousands are killed and maimed annually because of imperfect machinery, and they ask that this slaughter may be reduced to the lowest point practicable, by a law compelling the introduction of life saving appliances. It is a case in which the dead appeal to the law-makers; it is a case in which thousands of men present maimed hands and arms, and legs, and demand redress. It is a case in which widows and orphans appeal to the law-makers to rescue the wives and children of others from the same wretched fate.

Again, organized workingmen and all workingmen who have ideas, superior to those of scabs and convicts, demand the enactment of laws which shall put an end to penalties inflicted by employers upon their choice as freemen, to join a labor organization. To join such an organization is a constitutional right, nor is there anywhere in this broad land, a statute which prohibits such an exercise of inherent right. This being true, workingmen demand that employers shall not have the power, directly or indirectly, by contract written or oral, to inflict any penalty whatever, for the exercise of such a right.

We would suppose that upon such a proposition the workingmen of America would be a unit, and that in every state they would bring their power to bear to induce legislators to enact a law emancipating them from such slavish bondage; that upon such questions they would mass their sovereignty and sweep away the last vestige of the power of employers to degrade and oppress them.

It would be an easy task to catalogue laws which oppress labor, and to suggest other laws which would relieve labor of antiquated wrongs, so flagrant that it creates astonishment that they have not long ago been abolished, as for instance, the infamous co-employee abomination which strikes down the claim of A for damages, because of the incompetency or negligence of B, a co-employee; a wrong that exists independent of statute and is based entirely upon the decisions of courts, running back into the twilight of English jurisprudence, when workingmen were mere cattle and their employers were masters. Still the infamy exists, and employers, who are the beneficiaries of the wrong, have hitherto been able to crush, in most of the states, all remedial legislation.

It is to be hoped that upon such things labor may be induced to unify, and taking the aggressive in politics, bring about the reform required.

---

## . SELF-MADE MEN.

---

The term, self-made men, is seemingly paradoxical—since men who rise from obscurity to eminence in any of the walks of life, must have been assisted by agencies quite independent of themselves—and yet, men are properly styled self-made who without parents or friends to discover those inherent qualities of mind which achieve success, hew out their pathways to distinction self-directed.

It has been truly said, that American institutions are pre-eminently favorable for the development of the mind forces of the masses of the people; that to use a phrase, somewhat slangish, those who start out in life under unfavorable conditions may get "on top," if they have the required amount of "sand," that is to say, courage, pertinacity, diligence and that superiority of soul which patiently endures privation; that clear vision, which sees victory from afar, and that tenacity of purpose which defies obstacles, and steadily marches towards the goal of success. In such regards, there is no

country on the face of the earth that offers equal opportunities to those which distinguish the United States of America—nor, indeed, approximates them. Such facts, whatever may be said of them by those born rich, are of the greatest possible significance to that vast majority who were born poor.

The subject, self-made men, at once presents temptations for discursive writing. It brings into view the declaration of a self-evident truth that men in the United States of America, whatever may be said of other lands, are created equal, that is to say, birth establishes no prerogative for one class, that is not equally the right of all other classes, among which, and all of which, are the rights to "life, liberty and the pursuit of happiness." It may be true, and from certain indications there are reasons for believing the statement, that opportunities for aspiring youth to overcome the disadvantages which poverty creates are not as numerous now as in the earlier days of the republic, and that, as a result, self-made men are less frequently heard of in public affairs. We doubt if such conclusions are well founded. On the contrary, we think, if the facts could be ascertained, the conclusion would be that self-made men are rapidly multiplying, though it may be true that there are fewer of the type in positions to attract the public gaze—the reason being that self-made men are *making* themselves along lines of endeavor other than political distinction.

It has been justly said that the largest share of the mind forces of the country is no longer attracted by the glare and glamor of political preferment. Indeed, it is asserted that the most brilliant intellects are not found in what is called the "learned professions." If this is true of men whose youth was favored with opportunities for education and powerful friends, wealth and its influences, it is reasonable that youths less favorably situated, as they unaided solve problems and advance, will also in a great majority of cases seek their welfare by identifying themselves with the great industrial enterprises of the period, and this is really what is happening.

It is true, that our legislatures and congresses, courts and bars, are overrun with *half-made* men. The people, strange to say, tolerate these *misfits* for a time and then discard them, and as a result, there are judges without bench or ermine, lawyers without clients, legislators without a constituency. If we proceed with the investi-

gation of dead failures, we find clergymen without pulpits and doctors without patients—and these exhibitions of failures are fruitful of determinations on the part of many a brainy youth who has his fortune to make, by virtue of pluck and perseverance not to accept elegant pauperism and decayed dignity as examples, but to make himself useful by mastering some trade, and with such equipment, await events, ready and qualified at all times for promotion, and here it should be said, that the term “self-made” invariably implies success.

We read from time to time of railroad men who have advanced from indigence and obscurity to positions of responsibility, and it is noteworthy that in every instance they are self-made men—students from the start—students of men, of things, of books—of everything pertaining to their chosen calling—indomitable and indefatigable, they were always engaged in the *self-making* business. Such men, (and it is a misfortune that their biographies are not printed), are splendid examples to all youths who must *make* themselves, must rise by their own will power, or remain forever at the bottom of the ladder.

The biographical history of the United States abounds with the names of illustrious men who struggled up from conditions of extreme poverty, a poverty which triumphantly demonstrates the possibility of success when there is will power and an unyielding purpose to advance, regardless of obstacles.

It is doubtless true that the most illustrious self-made man the United States has produced, was Abraham Lincoln. The advancement of this youth from squalor and illiteracy to the summit of fame to brighten as the centuries go by, reads like fiction—and yet, every incident in the life of the great citizen from youth, bears irrefutable testimony that where there is a will, there is a way to “sound all the depths and shoals of honor” and win victories all along the line. Poor, friendless, illiterate, required to toil as a mere farm hand or a flatboatman, he read, thought, toiled and advanced—in everything a self-made man.

Henry Wilson, of Massachusetts, was another splendid type of a self-made man—in some regards, perhaps, more pronounced than Abraham Lincoln. The son of a farm laborer in bleak New Hampshire, from childhood till he was of age, one year at school was the

limit of opportunities in that direction. Apprenticed to a farmer at ten years of age, he remained until he was twenty-one, but though his school days were few, he managed to read a thousand books during the period of his bondage. Quitting the farm, he learned the shoemaker's trade, and by frugality saved enough from his wages to enable him to add to his limited learning, and thus aided in overcoming the disadvantages of poverty, he steadily advanced to political positions till he reached the Vice Presidential office of his country. Henry Wilson, the "Natic cobbler," the poor boy and self-made man, represented the state of Massachusetts in the United States Senate and placed his name beside those of the most distinguished sons of that old commonwealth, and at no period of his career was Massachusetts required to blush for his words or acts. If the Adamses, Websters, Everetts and Choates had borne high advanced the banner of the old Bay state in the arena of learning and statesmanship, Henry Wilson, the self-made man, never lowered it the fraction of an inch.

Andrew Johnson, the North Carolina youth, was, if possible, poorer than Henry Wilson—and in his boyhood and early manhood was more unfavorably situated for advancement. Scarcely knowing his alphabet when of age, simply a tailor, with an aged mother to support, he cut and stitched and pressed, and studied, and in a state surrounded by an aristocracy of wealth and refinement, he became Governor of Tennessee, a United States Senator and President of the United States.

We could fill the pages of the MAGAZINE for a twelve-month with the achievements of self-made men, who, in every department of human endeavor, have won success and renown, but the instances briefly referred to must suffice. If these awaken no aspirations on the part of the readers of the MAGAZINE who find themselves in positions not dissimilar to Lincoln, Webster and Johnson, then it were folly to extend the list.

We desire, however, to deduce from such incidents practical lessons for locomotive firemen of our Brotherhood. They enter the service of railroads, hoping at least to become engineers. Thousands of them succeed—some reach higher positions. There are thousands of firemen who will never become engineers, simply because they do not desire promotion. They are ignorant and prefer to re-

main so. They complain of their hard fate, but are everlastingly attributing their failures to the wrong cause. They are not students of anything. Ask them to undergo an examination, and to write out the answers to questions, and they will decline because they cannot *spell*. They will expend dollars for beer and whisky, but never ten cents to purchase a dictionary or a grammar. Ask them to solve a simple problem in arithmetic, and their ignorance will compel them to decline the task. This illiteracy, stupidity, lack of ambition, forever keeps them at the bottom. They see others advance, and instead of emulating their example, they prefer pool to school, and choose to hammer coal and shovel it into a fire-box rather than employ their leisure in learning what they must know if they expect to rise.

What is the remedy? We know of but one. There is but one—and that is to resolve upon a change of habits—renounce follies and vices, obtain elementary books and study. All self-made men have done this in the past, and men who are *making* themselves are doing it now, and will continue to do it as long as the world stands.

---

## THE HAWAIIAN, OR SANDWICH ISLANDS.

---

During the year of 1778, Capt. James Cook, a celebrated English navigator, discovered the Hawaiian or Sandwich islands. There are eight islands in the group, having an area of about 6,000 square miles. These islands are situated between 18 and 22 degrees north latitude and are about 2,000 miles southwest from San Francisco.

Their products are tropical, and semi-tropical, such as coffee, sugar, tobacco, arrow-root, cocoa, zano, wheat, sandal-wood and taro. Cattle and sheep are numerous.

When Capt. Cook discovered the islands, one hundred and fifteen years ago, their inhabitants were savages and cannibals, and numbered, it is estimated, about 300,000.

Capt. Cook having become involved in a dispute with the natives,

they murdered him on St. Valentine's day, 1779, and probably cooked him.

Some years after the discovery of the islands, the missionary spirit, particularly of the United States, centered largely in the interest of the heathen Hawaiians, and it was found that they, with exceptional readiness, received instruction, and when about fifty years had elapsed the Hawaiians had been converted to Christianity. Here and there an old timer had an idol hidden away, and a few retained a relish for human steaks and choice roasting pieces, but as a general thing they had abandoned their savage customs, and adopted civilized ways.

But as is seen by the rapid decrease of native population, civilization did not agree with them, since in less than one hundred years of civilizing methods, the nation has decreased from 300,000 to about 35,000, and the remaining remnant, as the auctioneers say, are "going," and in another 50 years will be gone.

According to the census of 1890, the population of the Hawaiian group, "consisted of 34,436 natives, 6,186 half castes, 7,495 born in Hawaii of foreign parents, 15,301 Chinese, 12,360 Japanese, 8,602 Portuguese, 1,928 Americans, 1,344 British, 1,034 Germans, 227 Norwegians, 70 French, 588 Polynesians and 419 other foreigners, in all, 89,990 souls." The proposition now is to annex these islands to the United States, to make them one of the Territories of the American Republic, and eventually constitute them a state of the Union.

Speaking of the products of the islands, it is proper to remark that leprosy commands special attention, so much so that one island is entirely given up to its transplantation from other islands where it is permitted to develop and go to seed and the crop is annually increasing.

Of the 89,990 souls on the Hawaiian islands not more than 2,675 would make desirable citizens, leaving 86,315 souls that ought never to be annexed to the United States under any circumstances. The Chinese, Japanese and Polynesians are simply so many slaves who do the work of the islands, and the annexation would, therefore, not only afford no outlet to American labor, but would serve to degrade labor, as it is everywhere degraded in all tropical and semi-tropical lands, and it might therefore be prudent for organized labor to be heard upon the subject of annexation.

It is believed by some people who profess to be students of cause and effect, and of coming events, that in due time, and at no distant day, all of North America will be under the jurisdiction of the "Star Spangled Banner," sometimes called "Old Glory," and it may be, in addition, that Cuba will be included; but this thing of going 2,000 miles to sea to secure 6,000 square miles of volcanic islands, is not thought to be "manifest destiny," but up to the present "manifest destiny" is a puzzle no one is able to solve; hence there is no telling what will occur, should Uncle Sam find himself the victim of a well developed case of annexing fever. But this thing of annexing about 30,000 Chinese, Japanese and Polynesians to get 6,000 square miles of lava beds and the largest volcano in the world, ought not to be done with a hop, skip and jump for the gratification of a few millionaires who alone will be the beneficiaries.

---

## CARNEGIE.

During the closing days of January, 1893, Mr. Andrew Carnegie, after an extended sojourn abroad, found himself again on American soil.

During his absence the Homestead horror, under the management of H. C. Frick, occurred. Andrew Carnegie having posed before the American public, and as much of the world outside as he could reach, as a sublimated millionaire, making money only for the purpose of conferring benefits upon the poor, would, it was believed, if appealed to, arrest and change the murderous and damnable policy of Frick, in the management of the Carnegie mills at Homestead. He was appealed to by his old, tried, and faithful employes to interpose in their behalf and see that simple justice was done them.

At the time these appeals were made, Carnegie was in his castle in Scotland, wallowing and rioting in the wealth which his Homestead employes had made it possible for him to secure. In his castle halls there was music, and dancing, and feasting. Carnegie was surrounded by British and Scotch nabobs whom he was entertaining in princely splendor, and when from out of his mills, once the center

of peace, prosperity and contentment, but transformed into a hell by Frick, there came to him appeals for help, it was a supreme opportunity for Carnegie; one word from him, the principal owner of the property, would have sufficed. Frick, the blood-thirsty monster, would have cowered and slunk into quietude, like a wild beast, under the lash of its keeper. But Carnegie did not respond; silent as a brass dog, he saw the electric batteries erected around his mills and the scalding water machinery completed to kill workmen because they demanded fair wages. He saw Pinkerton murderers, hired from the slums of cities and armed with deadly weapons to murder at the word of command, flocking to Homestead; or if he did not see these murderous schemes progressing, he knew of them, but said not a word; he made no sign, or, if he did take notice of them, it was to approve of Frick's plans and urge him forward in his satanic work, and as a righteous result, the ineffable infamy earned by Frick, attaches, without a modifying circumstance, to Carnegie, and will remain upon his name, indelible stains, forever. Like the mark upon Cain, he will carry them to his grave.

When Carnegie arrived in Washington city, report had it that during his stay "startling developments" would occur upon his arrival at Pittsburg. It was reported that

Carnegie was not at all pleased with the unpleasant prominence into which he was brought by the late Homestead riots. The fact that he has made millions of dollars out of his "protected" industries argued rather badly for him when an attempt was made to reduce the wages of his men. Moreover, it is said that some of the indicted men are old employees of the company, between whom and Mr. Carnegie the most cordial relations exist. It is believed, therefore, that Mr. Carnegie will use what influence he possesses to have the indictments quashed and the sentences of those men who may be convicted made as light as possible. Those who saw the Pittsburg millionaire yesterday say that he has aged considerably in the last year, and that his appearance indicates the severe strain to which he has been subjected since the riots began.

This turns out to be the sheerest poppy-cock. His works have doubtless lost money by Frick's policy of robbery and murder, and have gained an infamous notoriety. These facts, doubtless, have caused the Scotchman unrest. He loves to make money, give a few thousands, now and then, just to advertise his purity and philanthropy and brace up his "Gospel of Wealth." He likes to strut and pose as an Abou Ben Adhem, one who loves his fellow man, but his

unqualified indorsement of Frick makes all of his pretension in that line just so much despicable duplicity. After a column of the most disgusting bosh about not hoarding money, and the assertion, "I shall never accumulate money," he says :

And now one word about Mr. Frick, whom I recommended to the Carnegie Steel Company (Limited), as its chairman, and my successor four years ago. I am not mistaken in the man, as the future will show. Of his ability, fairness and pluck, no one has now the slightest question. His four years' management stamps him as one of the foremost managers in the world. I would not exchange him for any manager I know. People generally are still to learn of those virtues which his partners and friends know well. If his health be spared, I predict that no man who ever lived in Pittsburg and managed business there will be better liked or admired by his employes than my friend and partner, Henry Clay Frick. I do not believe any man will be more valuable for the city. His are the qualities that wear. He never disappoints. What he promises he more than fulfills. Good workmen or able men, who wish to do what is fair and right, will learn to appreciate Mr. Frick. Neither inefficient officials nor bad, unreasonable, violent workmen does he like, and these will not thrive with him.

The public will want to hear no more from Andrew Carnegie. He is hand in glove, heart and soul, body and brains, money and muscle, including electricity, hot water and Pinkerton thugs, in alliance with Frick. What Frick has done is unequivocally endorsed, and he does not hesitate to outrage public opinion by beslobbering the monster with his fulsome eulogies. Had Carnegie concluded to bestow flatulent commendation upon any successful buccaneer, land-pirate, or train-wrecker, they would have been received by the American public, as quite as appropriate as his florid endorsement of H. C. Frick, who is accounted as the most detestable villain, whose money gives him power to rob and degrade workingmen.

The American public did feel a lively interest in the utterances of Carnegie relative to the Homestead horrors. He had for years posed before the public as a mortal of seraphic mould, a millionaire hog with improved snout, with grunt and greed eliminated, a man who by some miraculous power had had all the devils cut out of him and with eyes turned heavenward panted like a wind-broken horse for opportunities to do good and now, where do we find him? Sitting on Frick's knees with his arms around his neck, besliming him as an anaconda does a calf preparatory to swallowing him neck and

heels—Carnegie and Frick wedded and welded together by the cohesive power of plunder.

After this the American public will not care a pinch of snuff what becomes of Andrew Carnegie. He is rich and can rest in luxuries purchased by his ill-gotten money, and like the rich man we read about, he may be heard from eventually bemoaning his thirst and willing to part with his vast wealth including his castle in the Highlands, for "a drop of cold water," which Frick would doubtless give him if he were not baking in a coke oven close at hand and himself quite as thirsty as Carnegie.

---

## COMING EVENTS.

---

The dogma, "History repeats itself," is of universal acceptance. Is it true? The answer is, yes, and no—each correct from different points of view. We omit all records of physical phenomena. In such matters history daily repeats itself. The tides ebb and flow, comets come and go, as do the seasons. Earthquakes and cyclones, as of old, leave their reservations and go on the war path to perpetrate their devastations. In recording such things history repeats itself. But in regard to matters relating to men and nations, as in by-gone centuries, history does not repeat itself, and will never again repeat itself—that is to say, in all cases there will be such modifications as to destroy the parallels. Anything approximating a careful analysis of the subject must lead to the conclusion that coming events, in human affairs, are to be totally unlike the events which history has recorded of the past in that line.

We are not unmindful that in writing of the future the idea suggests infinity and therefore reaches beyond all mental grasp, and that no man knoweth what the future has in store for the world. Nevertheless we know what history has recorded, and we know what is now transpiring, and however exhaustive the search we find no instance in which history is repeating itself. Events as they occur are unlike former events, and it may be observed that when approximations are noticed there are such modifications as to create wide dissimilarity.

No one supposes that history will repeat itself in recording such events as relate to the Jews, to the rise and fall of the Assyrian, Persian, Egyptian and Roman empires, and to others that could be named. Conditions have changed to an extent that makes the repetition of such records impossible. We are aware of the claim that human nature is "the same yesterday, to-day and forever." In so far as the attributes of human nature are concerned, the statement is doubtless true, and we would not change them if we could. We would not have man a machine—an automaton—but it is nevertheless true that human nature is susceptible of vast improvement, ranging upward from the degeneracy of the Hottentot to the full-orbed intellect of a Sir Isaac Newton, and it is this fact of mind development that is changing the character of events, and therefore, as a matter of course, making it impossible for history to repeat itself. Hence, however schooled men may be in "mystical lore," and however capable of interpreting the "shadows of coming events," the event itself will, if it comes, be unlike events of the past.

We do not doubt that the law of cause and effect is irrevocable, nor do we doubt that the law exists in human affairs as certainly as in nature. Idleness is the prolific parent of vice; ignorance breeds superstition, etc., to the end of the chapter; but in the steady advancement of human nature antagonistic forces have been put in operation which modify effects, change results, and hence history chronicles events essentially different from those which occurred in the past, when such antagonistic forces were not in operation.

Take for instance the dogma of a "divine right to rule," unchallenged for centuries. We now behold an opposing force in the field—call it **TRUTH**, if you please. It is quite as much an attribute of human nature as error, and is everywhere wrecking error. It bombards thrones, autocracy, plutocracy and aristocracy, and champions democracy, or the rights of the people. It is the eternal foe of ignorance and the hope of the world. It brings into flaming prominence the poetic prophecy of Bryant:

"Truth, crush'd to earth, shall rise again;  
The eternal years of God are hers;  
But Error, wounded, writhes in pain,  
And dies among his worshippers."

This development of all the attributes of human nature is to change

coming events. Nothing is more certain in human affairs, and within the entire realm of investigation there is nothing more cheering to the world of labor.

We do not doubt that the era has dawned when the capitalistic class will put forth its mightiest efforts to change the trend of labor affairs; all the signs point in that direction. But labor, observant of forces and factors, proposes that history shall record events quite different from those which have occurred in the past, when autocrats marshalled their hosts for the fray and labor paid all the penalties of defeat.

It is a campaign of education, pure and simple, and the supreme question is, what shall be the character of coming events? Labor can, if it will, require history to chronicle events such as the world has not known since "the morning stars sang together and the sons of God shouted for joy."

---

THERE are 10,000 people in the city of New York, every night with only such shelter as the skies afford notwithstanding there are dens called "spot lodgings," where a human being can sprawl out on the floor for the sum of three cents—or obtain a chair all night, for a nickle.

---

NOTWITHSTANDING the Prince of Wales receives a salary of \$200,000 a year, independent of his income from bacarat, he consented to dine with Mr. Chauncey M. Depew, the labor agitator, who starves on \$50,000 a year.

---

THE United States has more miles of railroad track than Europe, Asia and Africa combined, by nearly 10,000 miles, and yet, Europe alone has 235,000,000 more population than America.

---

THE fishermen of the great lakes of the United States, for the ten years ending 1891, caught 1,000,000,000 lbs. of food fish, yielding a revenue of over \$25,000,000.

## CONTRIBUTED.

### A GLIMPSE AT THE LABOR SITUATION.

BY SAMUEL GOMPERS, PRESIDENT OF THE AMERICAN FEDERATION OF  
LABOR.

"Of what use is the union, what have I gained by it?" are expressions we often hear uttered by some people who probably have the best intentions, and, in some things, fairly intelligent. We might as well ask what has the inventive genius of the ages brought us? What has been accomplished by our forefathers in achieving independence for these United States? or what was the advantage of the war to maintain the Union and the emancipation of four million human souls from chattel slavery?

For century upon century the militant spirit was acknowledged. It dominated the affairs of life. The worker, the wealth producer, was merely regarded as a necessary adjunct to the successful prosecution of military struggles and conquests.

With the uprising of the masses to throw off the military yoke and set aside the power that hindered the free and full development of labor and its resources, there came a time when the world regarded that the highest form of civilization was not the subjugation of nations and peoples under military despotism and invasions, for the capture of serfs or slaves, but that a new field of intellectual, social and moral development had opened; the production of wealth by the toilers to satisfy the necessities and gratify the desires of a rational, intelligent people.

To whom are we indebted for the changes and transformation from the military to the industrial aspect of life, but to the toiling masses of the world? and what was the factor which secured the united effort of the toiling masses, but the organizations of labor? The fact is, that of all the classes in the world, the toilers themselves observe least the wonderful changes brought about by and through their own organizations.

The fact that the changes and improvements which have taken place in the condition of the workers, by reason of their own efforts having failed to make a marked impression on their minds, is easily accounted for. We are so easily susceptible, and so naturally accustomed ourselves to newly acquired rights and improved surroundings, that we can scarcely look back to the time and bring ourselves to believe that it was possible for us not to have enjoyed them.

Take the toiler who has worked ten hours a day, and who, through the association of himself and his fellows in a union, has, in the course of a struggle of five or ten years, reduced the hours of his labor to nine or eight, if he is asked to take a retrospective view he will

scarcely be able to imagine how it was possible for him ever to have worked ten hours a day and still live. With others who have toiled still longer hours, it is even more difficult to comprehend the change and benefit.

The wage-workers who secured an increase in their wages of fifty cents a day, two, three or five years ago, have found easy use for this increase, possibly by some little addition to the dress, or the appearance of the home, a new book, or allowing the child to remain at school until a later age, or, in fact, the thousand and one things that constitute a little better condition or home comfort.

These improvements and environments grow upon us so naturally that it is with the greatest stretch of our thoughts we can bring ourselves to believe that life was at all tolerable or that we ever existed without them.

The greater respect secured by the workers from their employers seems so natural and manful that we would resent, as if insulted, the reflection that at any time we were in a less independent and fair position.

I trust that I may not be accused of being too much of an optimist. It is needless to remind me of the wrongs which exist, for they have too indelibly impressed themselves upon my heart and mind.

Of course it is unjust, yes, barbaric, when we see the conditions by which a large number of our fellow toilers are surrounded. A system of society which allows a man or woman to want who desires to and is capable of working and producing wealth is an unjust system; a system of society which permits its young and innocent children to be forced into the factory, the workshop, at a tender age, robbed of the means of an education, dwarfed in both body and mind, and too often brought to a premature and untimely grave, is a system that every earnest, honest, humanity loving man should seek to supplant by one in which the consideration and safety for all the members will be the paramount idea.

Wherever the working people have manifested their desire for improvement, by organization, there, as with a magic wand, improvement has taken place. Wherever the working people are the poorest, most degraded and miserable, there can we find the greatest lack of organization. There are some who believe that it is necessary that the condition of the people must become worse to bring them to intelligent action. That such a premise is wrong and illogical, the entire history of the world attests. In fact, the contrary is the truth.

The improved habits, and customs, and conditions (the result of organization only) of a people, enlighten them upon the wrongs which exist, and creates that healthy discontent so essential to the solution of the many problems by which they are confronted and which it is their mission to solve, and the establishment of honest, just and humane conditions it is their duty to struggle for and attain.

Upon the surface, our movement is viewed to secure a reduction in the hours of labor, an increase in wages, a larger share in the product of our labor, a modification of the severity and inequalities of

the laws of our country, a protection to the life and limb of the workers, the safety of the children, who are to be the fathers and mothers of coming generations, but above and beyond all, it stands as a protest against all injustice and wrong and seeks to realize and establish the long looked for hope, when man's inhumanity to man will be a thing of the past.

To many of our fellow toilers who look forward to the great work yet before us and who feel as if our future is insurmountable, I would suggest a looking backward into the dim distant past and see the vantage ground already gained, and I am sure they will view the future obstacles as much easier to overcome.

Our past and present struggles are but one continuous and never ending series of contests, preparatory to those we will be finally called upon to meet.

Active membership in the unions of our trades or callings is a prerequisite to an intelligent comprehension of our situation. It brings a broader comprehension, a more enlightened self-interest, which is best subserved when the interests of all are considered.

Regular attendance at the meetings of our organizations, a discussion of first principles and necessities first.

The question of the hours of labor, wages, fair treatment in shop, factory, mill or mine.

The perpetuity of the institutions of our country, the maintenance of the liberties of the people, the extension of fraternal help to the down-trodden of all nations, the recognition of the identity and solidarity of the interests of the wealth producers of the world; these are among the underlying principles for which the trade union movement stands.

As the small grains of sand, in the aggregate, form the great lands of all countries, so the integral parts of our individual membership in our trade and labor unions form the local unions, the national and international unions, the brotherhoods, the American Federation of Labor, and lastly, we hope the universal federation of the workers of all countries.

---

## SINGLE TAX FALLACIES.

BY W. H. STUART.

### No. 3.

To the single tax mind no proposition appears more certain than that the confiscation of economic rent, as contemplated by the single tax, would produce sufficient revenue to defray all the cost of government, national, state, and municipal. Indeed Mr. George goes further and says:

Government could take upon itself the transmission of messages by telegraph, as well as by mail; of building and operating railroads, as well as opening and maintaining common roads. We could establish public baths, museums, libraries, gardens, lecture rooms, music and dancing halls, theatres, universities, technical schools, shooting galleries, play grounds, gymnasiums, etc. Heat, light and motive power, as well as water, might be conducted through our streets at public expense; our roads lined with fruit trees; discoverers and inventors rewarded; scientific investigators supported; and in a thousand ways the public revenues made to further efforts for the public benefit.

The program, it will be noted, was a liberal one. Indeed to many of his followers it went too far in the direction of state socialism. Therefore arose the division into single taxers "limited" and "unlimited." The former, led by the "distinguished statistician of the movement," Mr. Thos. G. Shearman, favored limiting the confiscation of rent to the amount necessary for the ordinary expenses of government, letting the shooting galleries and dancing halls go. Mr. Shearman estimated that the amount needed would be 65 per cent. of economic rent. In a lengthy article, running through three numbers of the *Standard*, under the caption, "One Tax Enough," he based his calculation on the value of land in 1880 as \$14,547,000,000. Estimating economic rent as 5 per cent. of that amount, he arrives at the following conclusion:

Gross economic rent at 5 per cent. . . . .	\$836,812,000
Gross necessary taxes . . . . .	580,898,000
Gross surplus . . . . .	\$256,419,000

"This would," says Mr. Shearman, "still make taxes only 69½ per cent. of economic rent. In short by no possible calculation which can be honestly made by any intelligent man can it be shown that the economic rent of the United States is not far more than sufficient to supply all the needs of the most extravagant and corrupt form of government that has ever existed on this continent." And he concludes (*Standard* of April 30, 1890) with the assertion that "everything seems to point to the conclusion that the cost of government everywhere is less than two-thirds of the ground rent." I shall endeavor to show that this expectation is founded upon a shallow fallacy.

Before doing so, however, I desire to call attention to another curious single tax fallacy, viz: that all valuable urban and suburban land would be occupied under a single tax regime. This idea crops up everywhere in single tax literature. The holder of vacant land is everywhere denounced for his "dog-in-the-manger" policy of neither using the land himself or allowing others to use it. The crowning glory of the single tax is "that it will force the vacant land owner to improve his land or abandon it to those who will."

It is everywhere assumed that when the government becomes the universal landlord there will be such a rush for land as the world has never witnessed. Under the magic influence of the single tax, tenants will, like the men of Rhoderick Dhu, spring up from the very ground and people the waste places of the earth. Thus the *Standard*, in an article referring to an offer made by the town of

Woonsocket R. I., by which a Belgium manufacturer was to obtain a site for a factory at a nominal price and for a term of years free from all taxes on the improvements, exclaims: "If we of New York would make the same kind of offer to manufacturers generally, every piece of vacant land on this island would have a factory on it in a very short time. But until those who are now holding our land are made to loose their hold we will not be able to emulate the little Rhode Island town. What will make them loose their hold so that manufacturers will rush to this island, erect factories and give employment to idle thousands?" And the triumphant answer that concludes the article is: "The single tax will do it!"

As there is plenty of room for 5,000 more factories on the vacant land of Manhattan Island that would give employment to a couple of millions of workmen, and as a proportional increase would, presumably, take place in every other city on the adoption of the single tax, the mind stands aghast at the possibilities of trade expansion and increase of population that would be at once effected under the miraculous influence of transferring rent from the pockets of private owners into the public treasury. So, too, the *Detroit Evening News* asserts (editorial March 14, 1890): "Not only will the single tax not decrease Detroit's land rents, but it will, if anything, increase them. Not only will there be no vacant lots without value, but there will be a demand for every foot of land in the city." As there is, at present, plenty of vacant land in Detroit to furnish room for a million additional population, here is another illustration of the belief in the miraculous expansive force of the single tax.

So, too, the *San Francisco Star* (single tax) contends. "That the single tax would destroy speculative or monopoly rent is true, but at the same time it would greatly augment economic rent." The *Star* argued that what might be lost by the contraction of the area upon which rent would be exacted, would be more than made up by the competition for valuable sites within the decreased area. The *Star* of course assumes that such competition does not proceed now under existing conditions. It would be curious to know why.

Let us, however, return to Mr. Shearman and his figures.

It must be noted that he based his calculations on the income that would be derived from a 65 per cent. tax on the supposed *present* rental values of land under private monopoly. Here is where the fallacy occurs. Both Shearman and George confound economic with monopoly rent. Ricardo's law of rent is expressed by this formula: "Rent of land is determined by the excess of its produce over that which the same application can secure from the least productive land in use."

Let us give a simple illustration of this law. Here are, we will say, three tracts of land of varying productivity. We will number them 1, 2 and 3. No. 1 is the highest but has no value until all occupied, then land No. 2 comes into use. Now land No. 1 has a value expressed by its excess of productivity, with the same amount of labor, over No. 2. Let us express the difference as 10. Land in No. 2 will have no value until exhausted and land No. 3 comes into use.

Then the rent of No. 2 will be the excess of its productivity over No. 3, the poorest in use. Let us express this difference by 10. Then the rent of No. 1 increases to 20, as between it and No. 3. This is economic rent, and is exactly what would occur under a single tax regime. But suppose that while land No. 1 is being appropriated, certain speculators are enabled to obtain control of No. 2. They would be enabled as soon as No. 1 is exhausted to demand as rent of No. 2 its full productive value over No. 3, and the value of No. 1 would at once jump to 20. Rent in this case is the result of monopoly, and may be termed "monopoly rent." This is what takes place under our present system of private monopoly of land. We are compelled to pay monopoly rent.

But under the single tax all vacant land is to be taxed exactly the same as adjacent land of equal productivity or site value. Therefore, the adoption of the single tax would make it impossible to hold vacant land out of use, because none could afford to pay the assumed full rental value of land that yielded no income. The result would be that all vacant land, not needed for immediate use, would be abandoned by the owners from inability to pay the tax, and would remain without value until increase in business and population justified further improvements. But more than this, with vacant land plentiful and much of it of no present rental value, under the rule that improved land should pay no higher rent than adjacent vacant land, would not all improved land decrease enormously in value?

Of course those who assume that upon the adoption of the single tax the vacant half of Manhattan Island would at once come into use, and that double the number of opera houses, academies of music, hotels, ten-story flats, thousands of stores, factories and warehouses, palatial residences, and thousands of more modest ones; and that a couple of millions additional population is ready to rush in and occupy these improvements at a rent that will be remunerative to the owners; and who assert that the difference between paying rent to individuals and paying it to the state, and the abolition of all other taxes, is the only thing that prevents this extraordinary increase of population and development of industry, to them of course no difficulty will be experienced. But to those not affected with *dementia singletaxiosis*, it must be evident that as we have plenty of land to support a population of 1,000 millions; that under a tax that would prevent a monopoly of land, first class opportunities would be abundant for our present sparse population, and that economic rent under such conditions would not be one-fourth, or probably one-tenth, of that now obtained under our present system of private monopoly of land, and consequent monopolistic rent.

If the foregoing arguments are valid, then the very term, "single tax," as implying its sufficiency for all the purposes of revenue, is a misnomer and absurd, and exhibits in a striking manner the shallowness of the Georgian philosophy.

The writer first exposed this singular economic fallacy in an article written for the *Star* of San Francisco, (an able single tax paper),

Nov. 14, 1890. It has been repeated in other papers at various times since, but so far no serious attempt at a reply has been made by single tax writers. That George and Shearman now understand the difference between economic rent and that due to monopoly is evident. The former in his reply to the Pope, on "The Conditions of Labor," recognized the difference for the first time. And Mr. Shearman, although formerly entirely opposed to all personal taxes, now advises single taxers to favor an income tax. Seeing, no doubt, the fallacy upon which his former calculations were based, and the consequent impracticability of raising sufficient revenue on a land tax alone.

Paradoxical as it may seem, Mr. Shearman's 65 per cent. tax would probably produce more revenue, than the nearly total confiscation proposed by Mr. George. For while under total confiscation it would be impossible to hold any vacant land out of use, a 65 per cent. tax would permit, to a considerable extent, the speculative holding of valuable land. This would augment rent in two ways: 1st. By the additional rent derived from the unused land. 2nd. By holding valuable land out of use it would serve to increase the rental value of land already improved and in use. In other words it would be a considerable step in the direction of present conditions.

---

## A PARTING SHOT.

BY GEORGE C. WARD.

Before sailing from the sea of action for new and unexplored seas of discovery I cannot forbear a parting shot at the disabled hulk of the good ship "Single Tax." It is by a full and disinterested, an impartial and unimpassioned discussion of mooted economic theories that we must arrive at an answer to Pilate's question, "What is Truth?" It is truth that makes men free.

Will the readers of the MAGAZINE turn to the October, 1892, number, and in the course of an article from the pen of the gifted writer, José Gros, read again as follows?

To prove the feasibility of low taxes under the single tax is now in order.

We should commence by approximately specializing the economic land values of our nation. After long and careful study on the subject for the last five years, I offer the following estimates: Railroad land values, five and one-half billion dollars; telegraphs, telephones, street railroads, gas and city water, electric light plants, ferries, and all other state or city franchise corporations, two billions; all mines, petroleum and coal lands, cattle and lumber lands held in large masses by our potentates, two and one-half billions; land values in cities and towns of all sizes, ten billions; land values in farms, two billions. Total capitalized economic land values, twenty-two billion dollars; all such land more or less connected with improvements or more or less in

actual or possible use to-day. Those \$22,000,000,000 represent at 5 per cent., \$1,100,000,000 annual land values or land rents, due to the social organization for all social needs.

Out of that sum our 5,500,000 farmers would pay \$100,000,000, or 5 per cent. on the \$2,000,000,000 we have mentioned; that is, an average of \$20 for each farmer, with 5,000,000 of them. The economic value of many farms, 500,000 at least, is so low as to be practically zero.

What are the average taxes which the average farmer pays to-day, all told? The final cost of all finished products is increased about 50 per cent. by our tariff. The average farmer buys not less than \$200 worth of manufactured articles for annual family use, tools, wear and tear of buildings, &c., &c. That means \$100 indirect taxes. Add \$20 for direct local taxes. Total, \$120, against \$20 under the single tax *regime*, as we have shown.

Now take the many farmers with a mortgage on their farms. Call that, as an average per farm, the equivalent of \$800 at 5 per cent. Instead of his present private tax of \$40 interest he would pay but \$20. We assume but \$400 of that mortgage rests on improvements. The balance resting on land values, the farmer would owe to the social organization, that would be his single tax, the \$20 above mentioned, instead of \$140 for all taxes now, direct and indirect, plus the very \$20 he now pays to the mortgage holder for land values which, in ethics, belong to society.

It doth not yet appear by what occult means the inauguration of the single tax *regime* is to liquidate the farmers' mortgages, or substitute for the individual and corporate mortgages the "social organization," and for the interest charge of \$40 the single tax of \$20. For instance: The ratio of taxable land mortgaged in Missouri is 25.41 per cent.; in Illinois, 30.78 per cent.; in Nebraska, 53.18 per cent.; in Iowa, 46.95 per cent.; in Kansas, 61.56 per cent. These mortgages were given for capital in the form of money (saved wealth produced by labor), which strangely enough was loaned to the western producers of wealth by the eastern non-producer. The rate of interest runs from 8 to 12 per cent., which could not possibly have been paid out of a "residual increment," amounting annually to 4 per cent. after all demands for consumption have been satisfied, even if the demonetization of silver and other causes had not conspired to prevent the farmer from receiving his proportionate share of such "residual increment." The principal can only be paid in legal tender money, and although not increased in amount, as expressed in dollars, it will take 50 per cent. more of farm products to bring the dollars it would have taken when the debts were first contracted. These debts can not be liquidated by inaugurating the single tax system, nor can the "social organization" be substituted for the holders of the securities, until we revolutionize our form of government from an individualistic to a socialistic compact.

I take square issue with the statement that "The final cost of all finished products is increased fully 50 per cent. by our tariff." I cannot elaborate, but suffice it to say that the profits upon manufactured, or "finished" products will be found to be less than a fraction of that per cent. to the finishers or manufacturers, while I have shown in a former article that in Kansas, at least, the farmer has but \$320 per family with which to provide a sinking fund for the repair and final replacement of the buildings, fencing, work animals, machinery, tools and implements, and out of which he must buy fur-

niture, clothing, medicine, school books, literature, fuel, &c., &c., pay doctor bills, and last, but not least, pay the interest upon the mortgage and provide a sinking fund for the payment of the principal. Hence, his indirect taxes cannot well amount to \$100 a year.

Now for Mr. Gros' "economic land values of our nation." Let me first premise by asserting that the actual cash selling price of land, at which thousands of acres are bought annually by *bona fide* settlers for use and occupancy, contains no such element as a "speculative margin;" such element consisting of the difference between the price buyers *for use* are willing to pay and the price at which land speculators hold their lands. The actual demand for land *for use*, caused by pressure of population, will not be lessened by the single tax. The expression of this demand in price paid by buyers for use and occupancy is the capitalization of the *true* "economic rent" of the land of the nation. Under a single tax system individuals will yet be willing to pay as a tax five per cent. of the amount they are now willing to pay for a title deed. Indeed, it is not altogether unlikely that relief from all other forms of taxation may greatly increase rather than reduce the "economic land values of our nation." Putting it in another form: Under the present system *bona fide* purchasers of land for actual use, pay for land only what it is worth as a factor in production, under the present capitalistic monopoly of money and the tools of production. I speak of farm lands. As the single taxers do not propose to disturb the present relations of capital (money and tools) and labor, I contend that the "economic rent of land" will not be lessened or increased in any perceptible degree by the single tax system so long as capital of all kinds is monopolized by the few, and usury and profit reign supreme. But if, as Mr. Gros seems to think, the single tax will destroy monopoly, then the economic rent of land will be increased by just the amount now absorbed by monopolists. This seems plain to me.

Mr. Gros puts the economic "land values in farms" at two billions of dollars, and land values in cities and towns of all sizes, at five times that amount, or ten billions of dollars. In the state of Kansas assessed valuations are upon just about a 30 per cent. basis; that is to say, the assessed value of land is just about 30 per cent. of its actual, cash, selling value. Kansas had in the year 1892, land not in cultivation (unimproved), 28,848,470 acres, and 16,796,391 acres of land under cultivation (improved), assessed at an average rate of \$3.68 per acre, or \$171,167,129.85, showing a real valuation of \$570,223,766.10. Assuming, with Mr. Gros, that one-half of the value of improved lands consists of improvements, I deduct \$103,017,864.80, which leaves us \$467,205,901.30 as the real value of the bare farm land in the state of Kansas alone. But the actual value of the town lots in cities and towns, including all improvements, figured on the same basis, was only \$217,725,106.90, or less than one-half of the value of farm lands. In the state of Ohio, which certainly has a fair preponderance or proportion of large cities, the assessed valuation of farm lands, including all improvements, in 1890 was \$560,361,909, while the assessed valuation of all lots in cities and towns,

including all improvements, was \$570,773,589. I presume that the improvements in the cities and towns are worth fully as much as a whole as all the improvements upon farm lands. The assessment is, of course, made upon precisely the same basis in cities and in the country. Be that basis what it may, it bears some certain ratio or proportion to the actual cash selling value of farm lands and city lots. I think that Mr. Gros should re-consider his distribution of "economic land values in our nation." The assessed value of all real estate in the nation, for the year 1888, was slightly more than \$14,500,000,000, and our best statisticians consider that such assessed value is about 40 per cent. of the real value, which would then be \$36,250,000,000, which value, however, would include all improvements on farms and lots. The acreage of improved lands in farms was given by the census of 1880 as being 539,309,179, and its actual value as being \$10,197,096,776. It is estimated that in 1890 the acreage of farms approximated 700,000,000 acres and their actual value \$12,000,000,000. To this sum must be added the value of all unimproved farm and grazing lands in the nation, including "mines, petroleum and coal lands."

But, even granting that Mr. Gros is correct in his distribution of our economic land values instead of being at fault, as I think he is, both in his grand total and his distribution, he yet does not grasp the fact that the single tax (unlimited) would be, not a direct tax, but an indirect tax upon consumption. For instance, if the cost of farm products did not, as it does at present, exceed the return received for them, the single tax would be (not added) included in the price to consumers of such products, as otherwise there is no fund out of which the farmers could pay such tax. So with everything else. The manufactured product would include in its price the single tax (rent) upon the manufacturing site, the wholesale and retail store sites, and the residence sites of all concerned in the manufacture, handling and sale of such product. It cannot be otherwise. Thus it would be an indirect tax upon the consumers of such product in proportion to each consumer's consumption. The railroad single tax would be, as their direct taxes are now, included in and paid out of their gross receipts as operating expenses, and would be an indirect tax upon all patrons of the railroads.

I then conclude that were farming so profitable as that, above the cost of production farmers could realize from the sale of their products enough to enable them to pay the single tax (5 per cent. upon the value of the location) and yet have enough left to buy for consumption as many and much goods, commodities, merchandise, &c., as those employed in other avocations. The case of the farmer would stand thus, taking Mr. Gros' distribution for it:

Single Tax upon two billions of land values . . . . .	Shifted
Two-fifths of 5 per cent. upon twenty billions of land values . . . . .	\$400,000,000

This would make a tax of \$80 for each of our five million farmers, while to the poverty stricken, fairly well to do, or moderately well off wage worker, mechanic and small dealer in our cities and towns,

the single tax would bear exactly the same relation and operate upon in exactly the same manner as do the indirect tariff and internal revenue taxes at the present time, and they would have to pay five-sixths or more of the farmer's single tax in the price of the farm products they consumed, their own single tax upon residence sites as tenants or owners, as well as two-fifths of the single tax upon lands in cities and towns occupied and used for income producing businesses. The rich—well, the rich would only pay according to their consumption, just as they now pay the tariff and internal revenue taxes. If, however, I was preparing a tabulated statement, I should fix it up somewhat as follows:

TOTAL VALUES IN UNITED STATES.  
1890.

Farms (bare land) . . . . .	\$6,000,000,000
Unimproved lands . . . . .	1,000,000,000
Mines, petroleum and coal lands . . . . .	2,000,000,000
Lots in cities and towns (bare land) . . . . .	8,000,000,000
All buildings and other improvements . . . . .	13,000,000,000
Railroads and municipal franchises . . . . .	7,000,000,000
All personal property . . . . .	18,000,000,000
Total . . . . .	\$55,000,000,000

An apparent discrepancy of five billions, which is accounted for in one word, "water."

DISTRIBUTION OF SINGLE TAX.

Total tax, 1890. 5 per cent. upon \$23,000,000,000 . . . . .	\$1,150,000,000
The farmer would pay two-fifths of 5 per cent. upon \$17,000,000,000 . . . . .	340,000,000
The manual, mechanical and professional laborers, business men, and all city toilers, five-sixths of 5 per cent. on \$6,000,000,000 and one-half of 5 per cent. on \$17,000,000,000 . . . . .	675,000,000
The plutocrats would pay the residue . . . . .	135,000,000

Three-fourths of the wealth would pay less than one-eighth of the tax. The farmers' pro rata is based upon the assumption that the price of their products represents a profit, above the cost of production sufficient to include their single tax, after providing all necessary articles for use and consumption.

But do not understand me as meaning that this would not be an advantage over the present system. Under our present system the people are already paying "economic rent," not as a tax but as a bonus, or free gift to monopolistic corporations, individual landlords and land speculators. Besides this they pay the indirect tariff and internal revenue taxes and railroad and other corporative taxes, as well as their own direct state, county and school taxes. Under the single tax regime the payment of all these taxes would be avoided and the people would simply pay as a tax to themselves as a community, the rent and unearned increment they now pay to private individuals, corporations and land sharks for their private enrichment. The system would be an improvement over the present one, but I shall continue earnestly to contend that there is a "better way."

## THE COMING CIVILIZATION.

BY JOSÉ GROS.

No. 4.

The more we meditate on the general results of even the best parliamentary systems we have so far devised, the more disgusted we are forced to be with them all. Without denying that they represent a certain advance into popular freedom, we must confess that the advance is very lame, exceedingly incomplete, and with actual and constantly increasing disasters. Besides, they seem to involve fatal dangers for the future.

Who can prove that all modern nations, ours included, are not gradually marching towards the very abyss into which previous civilizations have been sunk? Suppose that we have avoided certain of the evils of the old civilizations. Have we not generated other evils that the old nations never developed, with the same intensity, anyhow? Let us grant, that in spite of all our drawbacks, we are better off than in the worst periods under the old irresponsible monarchies; yet, can we prove that we are better off than the people under the best old monarchical periods? We can prove nothing of the kind. We may even be able to prove the contrary, most especially, if we take into account what we do need to-day, which men in old periods did not need. Also, if we remember the much greater wealth accumulated by the few in modern times than by the few in old times.

Take, for instance, what we know as positive facts, through the experience of Xenophon and his 12,000 Greeks in their wonderful retreat across the immense territories of the Persian empire, until they reached Trebizonda, after over fourteen months of marches and countermarches. They had to be constantly avoiding large cities and the Persian armies. They had to go through belts of country with least population and least wealth. All the same, they needed, now and then, to approach country villages, where they could rest and obtain supplies; and they did often rest around such villages for days and even weeks. Almost invariably, they found such villages with quite an abundance of all that the 12,000 Greeks could need for them to have while resting, and for them to take away until they could find new supplies.

No army of any 12,000 men, traveling through our country to-day, could find any of our villages, or even middle size towns, with local supplies enough for any one day, without previous notification, of course, for the collection of supplies, from miles and miles around, or from larger centers of population.

The army of the Greeks, under Xenophon, was composed of the substantial elements of the Greek cities, men who, in most cases, represented the middle classes of the rich Greek emporiums, centers of commerce. Most of those men, not to say all, were intelligent fellows, with magnificently well developed bodies. Such men are not made with poor, scanty food, or the like. Yet, they were aston-

ished at the abundance enjoyed by those Persian villages, indicating that, if any thing, they were even better supplied than the old cities in old Greece.

Evidently, in that period and similar ones, Persia had less poverty than the great republic in the year of grace, 1893, after nearly thirty years of profound peace and immense prosperity.

A few months before the beginning of that retreat, the same 12,000 Greeks, with 100,000 Persians, all under Cyrus, the younger, had traveled over an entirely different belt of Persian territory, far off and totally distinct from the line of retreat we have mentioned. That army of 112,000 men found all that was necessary, in every town or city where the army stopped along 1400 miles of march. And Cyrus was really traveling through an enemy's country, since he intended to dislodge his brother from the throne, and he was killed in the attempt. Without long previous preparations, it is doubtful if any army of 112,000 men would find provisions enough anywhere outside of our twenty largest cities.

It looks as if the old irresponsible monarchies could develop at least as much genuine prosperity, if not more, than our modern nations, with all the fumes of political freedom, with the immense advantages of steam, electricity, improved machinery, public schools; with all the paraphernalia of modern progress, and, on the top of all that, twenty-centuries more historical experience than our brethren, the old Persians.

All the above would seem to prove that our political systems are as faulty as our economic methods. It proves that our modern parliamentary contrivances must eventually make room for something better. It proves that back of our industrial monopolies we have built up political monopolies. It proves that the ballot privilege must be made far more effectual than we have ever made it.

Under our past and present political devices, what does the ballot do, even when intelligently cast? It simply places a group of men in power for them to manipulate the nation as they may see fit, regardless of the wishes of the people. We don't find in the last six centuries a single parliamentary system that has not been converted into a species of oligarchy, more or less pronounced, more or less tangible, according to the conditions of each period and nation. They are altogether too complex, the systems in question; they contain too many wheels; they are loaded down with too much machinery; they are magnificently adapted to the evolution of intrigues and intriguers; they become just as irresponsible as the old irresponsible monarchies, because the individual hides himself behind the machine.

Grant that our American system has many advantages over others. Are we sure that they are good enough to save us from destruction? Have we not developed, in a little over one century, about the same evils that the European nations have evolved in ten centuries, and that it took old Rome fifteen centuries to evolve? With all our tendencies and aspirations towards a sound, a real democracy, have we not developed an oligarchy in politics, and the most insolent plu-

tocracy that has ever controlled the destinies of any nation, in silent but effectual alliance with the political oligarchy in question?

Suppose, that to-morrow, 51 % of the voters in England, France or Germany want to undertake any radical reform whatever; it can be carried out without much delay, under some energetic propaganda. No 51 % of the voters in our nation can by any means carry out any radical reform which may happen to be against the letter or spirit of the constitution. The legislatures of 26 % of the states can block the wheels of our national progress for all time to come, and those states may not contain over 15 % of the votes of the nation. That is minority rule with a vengeance. And minority rule is despot's rule.

Now, take our senate. Can you show us any house of lords in present or past historical developments with greater power than that senate of ours? It is not the creation of the worst uncrowned king, that of cliques of politicians in legislative halls. And that senate itself represents minority rule. States with less than 50,000 voters can have as much power as states with over 1,000,000 of them, through that senate, which can check all legislation, considerably disturb the executive functions, and, through its influence in the nomination of all important officers, contains the germs of the deepest political corruptions imaginable.

It stands to reason that each generation belongs to itself. Hence it owes certain duties to itself and to the coming ones. It also stands to reason that we have no right to let any idolatry towards the past interfere with our efforts in the realization of divine ideals. Sentiment is good enough in its place, but it should never stand across the path of duty. Besides, the law of self-preservation is supreme with individuals as well as with nations. And we are confronted with dangers too appalling for us not to face the situation in all its real, unmasked forms.

The dangers and perils of modern societies have been brought about by the intense selfishness, in legislation, that all parliamentary systems have developed on both sides of the Atlantic and the Pacific, at an increased ratio every twenty or thirty years. Can any pruning process permanently check that pernicious tendency? It seems more reasonable to declare that just as the irresponsible monarchies had to give away to our parliamentary systems, so the latter must eventually make room for something better. Such systems were devised for the purpose of giving to the people just rights enough to keep them quiet, and not rights enough for them to keep the wealth they could produce. The real object of all modern and semi-modern political systems is the creation of political monopolies with which to perpetuate and intensify all industrial monopolies, without the people being able to interfere with the process.

As a grand finality, men shall only find one remedy for the suppression of industrial and political monopolies, viz: "Legislation direct by the people, through annual or biennial elections, apart from annual or biennial elections for executive officers." Please don't hurry to say that that is impossible. It may not be possible for a

while. We shall, in future articles, indicate at least some of the simple processes by which in due time the finality in question could be brought about. Our suggestions may at least evolve thought on the subject and bring out still more simple processes through which to improve human civilization from the bottom by totally abolishing the machine in politics, as we have it and have always had it, the curse of all parliamentary systems.

[To be continued.]

---

## ECONOMIC MISCONCEPTIONS.

---

BY JOSÉ GROS.

We should not be surprised at the fact that so many bright minds have yet failed to grasp the new social economy known by the name of the Single Tax on Land values. It is so difficult to embody the spirit of any science in a single sentence! And, in our present case, the funny thing is that the single tax is not a tax at all. What is it then? It is righteousness applied to the foundations of the social organism. That has been proved sixty times over in the pages of this MAGAZINE, during the last two years, and we shall be delighted to prove it again in a few moments. We shall commence by ourselves playing the critic against our critics.

The friends in question keep asserting that the application of the single tax would not prevent interest, and what they call profits, to keep on ruling supreme as monopolistic elements over the industrial fabric. They have never proved that. They can never prove it. That mere assertion of theirs shows that they don't know yet what the single tax means.

First let us see about the question of interest as the permanent and oppressive feature that it has always been, more or less. Why is it that the many are forever in debt to the few? Because the many are constantly under tribute, through the payment of land rents to the few. Is not that just as self-evident as the diffusion of gases through space? Suppose a social compact composed of ten average family groups, in an island with 1,500 acres, each family paying an average of \$50 annual land rent for all public needs, extremes from \$20 to \$80 according to a little greater or less advantage in the fertility or location of each family lot or plot, used and occupied by each family. As long as such an arrangement was in force, resting on the free competition of the families in question, how could any one of them keep the rest forever in debt? We could safely offer a reward of ten millions of dollars to any of our friends who should satisfactorily answer that question.

In such a social compact money would have no power to kick

anybody out of land, no power to buy land, and only power to keep a certain portion of land developed in full, according to the general conditions of each locality and period. That seems to be simple enough! And yet, our friends refuse to understand that!

When we walk along the road, with the solar disk in full view, can we control the shadow of our cane unless we control the cane itself? Nor could anybody control any land products, in that social compact, as a monopoly combination, because they could control no land, as a mere monopolistic scheme. Again, is not that simple enough, self-evident enough? It is so amusing to notice the complete absence of logic with the very men most in need of logic because engaged in social reforms!

And without monopoly in land products, because of absence of land monopoly—and without interest on money, as an oppressive feature in industrial developments, because money could control no land and so no land products, in the sense of monopolistic combinations, how could we have that spectre of profits, aside from labor's legitimate earnings? Because we must assume that our friends refer to monopolistic profits. If they had taken the trouble of understanding the single tax, they would know that it means: "No more monopolistic profits in any shape whatever in the industrial organism!"

Now let us see about that other eternal hobby of our friends, the shifting of the single tax into the prices of products. The shifting of taxes! What is that but a process of robbery made possible through land monopoly—land robbery—and that alone? And how can effects exist if you suppress the cause? Fundamental robbery once suppressed, through the single tax, how could incidental robbery go on? Are not incidentals the result of fundamentals?

Take those ten families in that hypothetical island of ours, each family paying \$50 average land rent for all public needs, and so paying that to each other, how could they add that to their own private revenue, when that was given away as public revenue? When a collection is taken in church, to meet the expenses of that church, can the members of that church pocket back the money given in the Sunday collection, by adding it to the prices of the goods they may sell on Monday next?

We should now attack our critics in their last ditch. They pretend that what we need is to suppress land rents, but they never explain how that can be done. Can we suppress the force of gravitation? Just as that force springs up from the presence of matter in infinite space, so economic land rents spring up from the presence of population in the social compact, from competition, among men, for land of given conditions. Are not ten acres in the valley by a pretty stream, far more valuable than ten acres on a stony hill? There is the economic rent that you critics want to suppress. You are at war with nature; at war with God, although I know that you don't mean to do any such thing. And, in due time, our critics shall be just as good single taxers as anybody else.

To-day, as well as in all previous historical periods, the social or-

ganism can be compared with a kettle having a leak at the bottom, besides a number of leaks more or less near the top or kettle's edge. Many of our modern reformers imagine, as all previous reformers have thought, a few here and there excepted, that if we stop some of the leaks near the kettle's edge, that the kettle may commence to work, after a fashion anyhow. The single taxer is the only fellow who seems to be totally convinced that that kettle of ours has a bottom leak, and he is constantly saying to all reformers: "Gentlemen, as in the past, so in the present, our kettle, our social fabric, cannot even begin to work right until the bottom leak of wholesale land robbery is stopped." The logic of the situation would seem to indicate that as soon as the bottom leak is stopped, the job of stopping the side leaks cannot be a difficult one.

What is most refreshing to us fundamental reformers (a little infatuation does not hurt anybody) is the child-like innocence with which some men assume they could escape the single tax by investing in securities. What are securities but representations of wealth somewhere, resting on land values somewhere? Even government bonds, what are they but a general mortgage, partly resting on land values and partly on labor product values?

Just as the force of gravitation acts on all matter through the infinite, so the single tax would or could act on all the land values through the industrial fabric of nations.

And, one of the two, either we have to appropriate economic land values for all public expenses, or else we have to keep on letting monopoly land values enrich a few monopolists. It is in the latter case that such monopoly land values, higher than economic ones, are added to prices. It is in the latter case; and so in the past, and so in the present, that we not only rob the mass of workers, but prevent them from producing and retaining what would be equivalent to a full life among all men and family groups, according to the advancing conditions of an advancing civilization.

## MR. STUART'S SINGLE TAX FALLACIES.

---

BY JAMES MIDDLETON.

No. 2.

Mr. Stuart, in his second article, takes up the "security of tenure of land and improvements" under the single tax.

After a forcible presentation of his case, he says: "Is it not evident that if George's theory of the continuous increase of land values is correct that security of tenure, under the single tax, would be impossible?"

I have always supposed that Mr. George and single taxers generally taught that the effect of the single tax would be to raise the margin of cultivation and diminish present rents of improved lands. If, under the single tax, present land values should not diminish, and instead should continue to increase, and if the tax should practically take it all, and if the improvements and personal property of the holders should be held liable for the tax, then undoubtedly some would be taxed out of their homes and out of their savings, even though society, as a whole, should gain.

But there are several ifs in the way. As Mr. George himself has pointed out time and again, the effect of the single tax would be to raise present margin of cultivation, diminish present rents, accompanied by increase of wages and by the freeing of the laborer, whether with hand or brain, from nearly all of present taxation. The increase in rents would come primarily, not from increase of rents of land now improved, but from valuable lands newly brought into use.

Take Los Angeles, for instance, Mr. Stuart's home. I suppose it, like New York and other cities that I know, has a great deal of land unimproved, lightly assessed, and held for speculative purposes. The holding of these vacant lots at speculative prices diminishes to that extent the supply of land in the market and causes the rents of improved lots, and taxes as well, to be abnormally high; all of which rents and taxes come out of the industrious classes of Los Angeles. If Los Angeles should free all its improvements from taxation and should raise all its revenues from its lots and franchises, assessing the vacant lot at the same rate as the improved lot adjoining, it would discourage holding lots vacant and stimulate industry by freeing it from present taxation. The holders of vacant lots would either seek to improve or sell. If they improved they would become wealth producers and the amount of wealth and the demand for labor would both be increased. It is an economic law, that the more wealth is increased the greater the amount to be divided, and greater the demand for labor, greater are wages or the share that labor gets.

I suppose no one will deny that merchants, manufacturers and farmers fare better when wages are high and steady than when they are low and uncertain, even though the rate of profit is lowered.

Some holders would not improve, but would offer for sale; or some lots might be sold for taxes. According to the law of supply and demand the price of lots would go down. Undoubtedly some would revert to the city. To the extent the city became a holder it would be able to control rents. It could do this by placing the city lots at a fixed valuation of annual rent, thus preventing, on the one hand, the raising of rents by the landlords, and on the other preventing undue depreciation. Lands would become a great deal cheaper in Los Angeles. The revenues of the city might be less from present improved lots than now, while its total revenues would be increased by increased receipts from lots now held vacant for speculative purposes.

Such a policy would undoubtedly injure speculators, but would benefit all classes of producers and wage workers. The taxes of hold-

ers of well improved property, if the taxes were limited as I believe they should be, to the needs of wise and economical government, would be less than now, so to them would come a benefit of reduced taxation.

There remains to be considered specifically the cases of "Farmer Jones," on the outskirts of town, and "Smith, the mechanic," with a little home on a lot in the business center. As I have been considering well improved and vacant city lots I will discuss the latter first.

Under our present system, if he fails to pay his taxes he is sold out, even if the whole property is consumed thereby. His assessments, so far as my investigations go, are at the top notch, while the owners of vacant lots and of the magnificent blocks are under assessed. The investigations of Hon. Tom L. Johnson's congressional committee showed (May 24th, 1892) that it was emphatically so in Washington. I venture to say that there are no towns to be excepted. Our present complex multi-system of taxation offers greater opportunities for such gross favoritism than would the single tax, where every one would know just what his neighbor was paying.

Under the single tax, logically carried out—as Thos. G. Shearman, one of George's ablest followers, has clearly pointed out—the improvements would not be liable for the taxes. While any person failing to pay his taxes would, as now, find his land advertised for sale, yet, contrary to the present custom, the advertisement would provide that the purchaser must compensate the delinquent for his improvements. I am not prepared to say whether it would be found expedient to exempt the whole improvement or not, but the single tax, justly carried out, would in some such way as that give ample protection to the man, no matter how poor he might be, who sought to invest his savings in a little home. It would also certainly be easier for him to get a home than now. In fact I know of no way, in society as at present constituted, by which home-building could be as well stimulated.

"Farmer Jones," at the outskirts of a rapidly growing town, would find the same generous provision to protect his improvements. He would also find an additional safeguard in a diminished assessment, for some time to come, through the opening up of the more favorable business sites now vacant, nearer the business center. True, his chances to be a land speculator would be diminished, but his chances to be a prosperous farmer would be vastly increased.

I am really more interested in the general class of farmers, who live further from town and who cannot look forward to selling their land in building lots. On them our present system of taxation is falling with crushing weight, and rapidly reducing them to renters. When they improve their stock, machinery, and buildings the tax assessor finds them. When they buy the things they need the tax is there increasing the price. When their children seek farms of their own they have to spend all for the bare land and then have to borrow to make the improvements. The census bureau reports show that a large part of farm mortgages are for purchase of land and improvements.

No wonder interest is high, that mortgages are steadily increasing

and that the renting class is largely on the increase. No wonder so many farmers' sons and daughters crowd into the cities, increasing the supply of wage workers there, lowering wages among the city workers.

Such is the condition of affairs the single tax seeks to relieve by freeing the producer or consumer from present taxation, increasing his income some 25 per cent. and at the same time lessening the rent he has to pay; lessening the purchase price if he seeks to buy.

Besides all this, whether the assessment is yearly, as now, or at longer periods, it will protect, as I have shown, improvements from being wholly consumed by taxes or from being swept away by the rapacity of those who now like vultures watch the annual tax sales of property all over this country.

No, Mr. Stuart, so far from having shown the fallacy of the single tax, regarding the tenure of land and improvements, you have but called attention to one of its greatest virtues. When it shall come, each able and industrious married couple may dwell under their own vine and fig tree with a sense of security and freedom now unknown.

---

## SHORT STUDIES IN POLITICAL ECONOMY.

BY WILFRED P. BORLAND.

No. 4.

As land is an absolutely necessary factor in the production or wealth, the ruling classes have, in all ages, taken advantage of the fact to bring the masses into subjection to their wills. Primitively, land was everywhere recognized as common property; but, as society has developed from its rude beginnings, the ruling classes have succeeded in throwing over land the ægis of individual property, and surrounding it with the same safeguards of law as have applied to that other class of *really* individual property which we style wealth. This is the fact which the capitalist has taken advantage of to gain the better of the laborer in the business of production. Instead of using his capital, as an aid to labor in the production of wealth, the capitalist has used his capital for the purpose of securing rights over land, and thus placing himself in a position where he might surely obtain an undue share of the results of production. The system of capitalistic production, for profit, upon a large scale, is of comparatively modern origin; and, what is a significant fact, political economy did not begin to be cultivated as a science until after the development of the capitalistic system.

It has been the business of political economy, thus far, to force capital into the very forefront as the prime factor in production, and in order to do this it became necessary to invent the fiction that land is capital. It has been sought, in many ways, to relegate the land question to the rear, and arguments without number have been introduced to show that the land question is settled in the only way it can be consistently with the rights of property, and the requirements of an advanced civilization.

But circumstances without number have given the lie to these protestations; the land question is one of such hugeness that it positively will not down; it forces itself to the front in spite of all efforts to the contrary, and in spite of all the truisms and platitudes of political economy the fact stands boldly forth that the land question is not settled, and the further fact that justice will never reign upon the earth until it is settled and settled right. It is within the province of political economy to indicate the proper settlement of the land question; it would be much less than a science if it failed to do this. The proposition has been laid down that "labor produces all wealth." In the face of this the laborer sees himself toiling, without intermission, for a bare living while those who do no labor are surfeited with wealth. These, the laborer is told, are the capitalists. Is it any wonder that the laborer should complain that capital is robbing him? Is it any wonder that there should be a feeling of intense antagonism toward capital on the part of laboring men? In the face of these two statements it is idle to attempt to lull workingmen into quietude with platitudes about the sacredness of property; it is idle to point to the wonderful advances which have been made under the direction of capital; it is idle to tell workmen that they are the victims of a natural law of population, and are suffering from the natural effects of the law of supply and demand. Workmen are beginning to learn better than this; they are beginning to see that they are just naturally robbed in some way or other, and they cannot be controlled by the present methods much longer; sooner or later they will demand that the present system be abolished, and when the demand comes, it will come, after the manner of the people, in no uncertain accents. Well will it be for the ruling classes if they are able to meet that demand in the proper spirit; well will it be for workingmen if they are able to present a social scheme based upon pure equity for the one they overthrow. Well for them if they are able to free themselves from the influence of demagogues, and stand forth, freed from all selfish influences, as the champions of God's justice upon earth; and demand the enforcement of an economic policy which recognizes land as one of God's gifts to the human race, in which the humblest have equal rights with the most powerful. The importance of workingmen obtaining clear ideas on the land question is such that, before proceeding to trace out the laws which govern the distribution of wealth, I hope I may be pardoned if I devote a few of these papers to tracing a few historical developments connected with land. A more just appreciation of the importance of the question will thus be ob-

tained; we will be able to perceive analogies, and it will appear that the land question has, all through the centuries within the historic period, been the great fundamental question which has determined the social, political, moral, and intellectual activities of society.

## THE SPECULATIVE MARGIN, AND THE NATURAL PRICE OF LAND.

BY GEORGE C. WARD.

I am now ready for the consideration of the question "The speculative margin and the natural price of land," which Mr. Borland has so kindly endeavored to make clear to my beclouded intellect, with his simple little diagram, so well adapted to my powers of perception.

At the outset, I wish to reiterate my confession that, although I have steadily kept in view the objective point of my attack, I have (misled by the indiscriminate use of the term by political economists (?), including Mr. Henry George) used the term "economic rent" where I should have said "monopolistic rent." Mr. Borland has done the same thing. I now see that there should be a sharp distinction made between "economic" rent, arising from relative fertility and location, under a state of freedom (wherein the only title to land is "use and occupancy"), and "monopolistic" rent, under a system wherein men may hold, by virtue of improvements, as many sites or locations as they choose, renting such sites and improvements to the highest bidder. Standing, in relation to the single tax, just where Mr. J. W. Sullivan, editor of the *Twentieth Century*, does, I apply to Mr. Borland a quotation from the *Twentieth Century* of September 15th, 1892, as follows:

Does Mr. Middleton argue here as a single taxer on the question of rent? If he does, his argument falls to pieces in presence of these facts: Some months after the publication of my article of June 4, '91, George issued his "Letter to the Pope." There (p. 18), for the first time to my knowledge, he admitted a distinction between economic rent and monopolistic rent. That distinction was precisely the one to which I had drawn his attention. So George is now at outs with the distinguished authorities quoted by Mr. Middleton. Economic rent, George now sees, is the excess of the value a piece of land would have over the value of the land (zero) at the margin of cultivation—in a state of freedom. So he must have changed his mind since he made, as Mr. Middleton states, economic rent to mean the excess of the value a piece of land has over the value of "the poorest natural agent in use"—now, in a state of monopoly. This change of mind proves the truth of my argument of June 4, '91, that originally, in "Progress and Poverty," "George's single tax scheme was founded in error," that George proposed to "license robbery and tax the plunder." Mr. Middleton is behindhand; he has not known of George's change of mind. But other single taxers have. In the syndicate papers, August 27, the general editor, commenting on my statement that in absorbing the rack rent of to-day

the single tax would deprive producers of their wealth, shows that he knows economic rent to be, not the market rent of to-day, but what rent would be under freedom.

And to prove that Mr. George did, at one time, propose to perpetuate the robbery of the masses by monopolistic rent, through the medium of the single tax, I quote as follows from page 183 of *Protection or Free Trade*:

For a full exposition of the effects of this change in the method of raising public revenues, I must refer the reader to the works in which I have treated this branch of the subject at greater length than is here possible. Briefly, they would be threefold:

In the first place, all taxes that now fall upon the exertion of labor or use of capital would be abolished. No one would be taxed for building a house or improving a farm or opening a mine, for bringing things in from foreign countries, or for adding in any way to the stock of things that satisfy human wants and constitute national wealth. Every one would be free to make and save wealth; to buy, sell, give or exchange, without let or hindrance, any article of human production the use of which did not involve any public injury. All those taxes which increase prices as things pass from hand to hand, falling finally upon the consumer, would disappear. Buildings or other fixed improvements would be as secure as now, and could be bought and sold, as now, subject to the tax or ground rent due to the community for the ground on which they stood. Houses and the ground they stand on, or other improvements and the land they are made on, would also be rented as now. But the amount the tenant would have to pay would be less than now, since the taxes now levied on buildings or improvements fall ultimately (save in decaying communities) on the user, and the tenant would therefore get the benefit of their abolition. And in this reduced rent the tenant would pay all those taxes that he now has to pay in addition to his rent—any remainder of what he paid on account of the ground going not to increase the wealth of a landlord but to add to a fund in which the tenant himself would be an equal sharer.

I shall now ask our friend, the editor, to reproduce Mr. Borland's diagram and explanations thereof.

The square bounded by the lines  $a$  represents an area of land sufficient in extent to supply the wants of a given community, and the natural margin of production rests at the lines  $a$ . The area represented by the square  $b$  is withheld from use; and, as the demand is for the whole of the area within the natural margin and the square  $b$  lies within this area, the supply of land sufficient for the wants of the given community is just to that extent restricted. The

demand being for the whole of the area within the natural margin, and the supply being thus restricted, the community is necessarily forced to have recourse to land lying beyond the natural margin in order to supply its wants. An unnatural or "speculative margin" is thus created, which settles at the lines *c*.

The condition herein shown is precisely such as governs our land supply to-day; it is the condition we single taxers have in mind when we use the term "speculative margin," and I must insist that we know exactly what we mean, Mr. Ward to the contrary, notwithstanding. Now, let us reason a little upon this condition.

Every parcel of land within the lines *a* has a natural price; the amount of which price is estimated by the relative advantages of the land as compared with land situated at the natural margin. Now, by reason of the extension of the margin to the lines *c*, a new relation is established; the advantages which operate to give value to land are no longer estimated by comparison with land situated at the natural margin, but by comparison with land situated at the "speculative margin." An unnatural rent is thus created which we term "speculative rent," to distinguish it from rent proper, or rent arising by reason of the free operation of natural laws. Just how much of our land values are natural, and how much "speculative," it is impossible for any power short of omniscience to tell; the fact of the existence of the square *b* destroys the possibility of arriving at anything more than approximately correct conclusions. But, from our knowledge of the operation of the law of supply and demand, we are warranted in inferring that our land values are much greater than they would be if allowed to arise naturally. We are also warranted in making the assertion that, providing the area represented by the square *b* is forced into use, the "speculative margin" will be destroyed, the margin would adjust itself naturally at the lines *a*, and the rent of all lands within the area bounded by these lines would adjust itself to the new relations and be correspondingly reduced.

Before proceeding to a discussion of the issue involved, I will hazard a few ideas, "by the way." Mr. Borland's illustration is evidently largely hypothetic and theoretic, or else he finds his data across the ocean in some foreign land. For the past twenty years the United States has exhibited the anomalous phenomena of a steady depreciation in the value of valuable farm lands; to such an extent that, in the face of a continuous and abnormal pressure of population and in spite of individual and corporative monopolization of unused lands, the value of farm lands, in the aggregate, has shown a steady decrease in almost every state in the Union. An ounce of fact is worth a pound of theory. Much of this decrease in value is the result of usurious interest and abnormal profits realized by businesses carried on upon "valuable lands" in cities and towns and the consequent shifting by monopolistic non-occupying landlords of monopolistic rents paid for the use of such lands, the burden falling upon productive and distributive labor. There is no such factor as "natural price" for products in the United States. Specially is this the case with farm products. Cattle and hogs are priced by an enormous trust, or combine, by which the market is monopolized, and which sells dressed beef in Liverpool, England, for less money than in Kansas City, Mo., where the beeves are slaughtered. Wheat and cotton are priced in Liverpool and lowered by competition with the cheap lands of India, the price of a bushel of wheat in Chicago

being the price of an ounce of silver, less 15 cents transportation. That is where the demonetization shoe pinches the foot of the American farmer. As the United States produces very largely of agricultural staples for export, Mr. Borland should locate his "natural margin" (within the lines *a*)—say England, France and Germany, and extend his line *c* so as to embrace Russia, India and the United States. As an illustration of existing facts, Mr. Borland's diagram is a failure, but, as a hypothetical case, it illustrates his theory.

Now for Mr. Borland's economic scalp. The editor will please insert, as better illustrating the likely facts, this diagram:

My readers will please substitute the above diagram for Mr. Borland's and apply his explanation to the several lines designated by the various letters. The first thing I notice is that Mr. Borland virtually concedes my entire contention, in his admission or claim that non-occupying landownership is responsible for the "speculative margins," (or *monopolistic rent*;) as he chooses to call the overflow into the domain or area bounded by the letter *c*, caused by pressure of population. A deed of gift to the land held out of use, made by the non-occupying landowners to the occupiers of the area between the lines *b* and *c*, would quickly demonstrate the eminent correctness of Mr. Borland's conclusion. But it would do more. It would prove that political economists are mistaken when they assert that the withholding from market of the small squares represented by the letter *b* adds to the value of the residue of the land bounded by the line *a*. Not one dollar does such withholding from market add to the value of such residue of land. The only effect such withholding from market has upon the value of land is to give to the lands between the lines *a* and *c* a value they would otherwise have not acquired, such value being that of the land inside the line *a* which lies farthest from market, less the increased cost of transportation to market. The only effect of a free gift of the lands withheld from market, to the overflow population now occupying the

lands between *a* and *c* would be the immediate loss of the value now attaching to such lands, which would remain "free," or valueless, until the pressure of population again forced their occupancy. I defy any man to disprove this proposition.

But now assume that instead of making a gift deed to them, these non-occupying landowners persuaded and induced the overflow population to remove from the "speculative margin" and rent their lands, paying them one-third of all crops raised. The non-occupying landowners would then become non-occupying landlords. Now take two quarter sections of land, adjoining, of exactly the same degree of fertility and, of course, of equal distance from market. The crops prove to be exactly of the same measurement and amount and each man's crop brings, in the market, one thousand dollars. There is a difference, however. One farm is occupied by its owner and the other by one of these tenants. The result is that the occupying land owner nets \$1,000 for his labor, (crop,) and the tenant nets \$666.66. Now, then, right here I convince Mr. Borland, or give up the attempt, in disgust. The tenant has proved, as thousands of tenants are proving, that he can support himself and family, (make a living,) and yet realize \$333.33, or one-third less money for his year's work than did the occupying landowner. So here we have the factors—the market price; a subsistence for the tenant and \$333.33 monopolistic rent for the non-occupying landlord who protects the occupying landowner in the absorption of \$333.33 monopolistic interest upon the monopolistic value of his farm. Now, make "use and occupancy" the only valid claim to land and the non-occupying landlord is wiped out, and if the farmers have anything to say about the price of their products, their competition will reduce the price to the net result received by the tenant in the illustration and we shall have a "natural margin" instead of a "speculative margin." This is the logical sequence of a combination of "use and occupancy" and the "iron law of wages." Labor would receive a "bare subsistence" and land would be free from the burden of monopolistic rent and would yield nothing of advantage to its occupier, unless it might be pure economic rent, the result of greater fertility or closer contiguity to market. This would result in a "natural price," which is something we can never have under the operation of the single tax scheme, as outlined by Mr. George in the paragraphs I quote from, *Protection or Free Trade*. Such a scheme would, indeed, as Mr. Sullivan says, "license robbery and tax the plunder."

But let no man imagine I would reduce the price of farm products. No, indeed! Farm products are already selling for less than cost of production, there being no monopolistic rent inhering in the present ownership of a farm. The net result of twenty years of arduous toil is that one-third of the farmers are tenants on the land they once owned, while another third have their farms mortgaged for their full credit value.

In the case of farm lands, monopolistic rent robs the tenants instead of enriching the landowning farmer. The tenant only man-

ages to exist, because he lives that much nearer the level of a Russian or a Hindoo. The rent that robs and oppresses both productive and distributive labor, is monopolistic rent of land in cities, made valuable because of the usurious interests and abnormal profits realized. But, after all, rent is not much more of a robber than is interest or profit. Mr. Henry George would seem to have exhaustively treated the question "Protection or Free Trade?" and yet he touches in a very gingerly manner the real essence of it. The system of protection was inaugurated to protect us from the "cheap labor" of England, but economists fail to recognize the truth that cheap labor is made possible only by low rents and cheap money. In England rents are only one-half as high and the rate of interest from one-half to one-fourth as heavy as in the United States, profits being equally as low. We can never compete with England's low rents, cheap money and low profits, under a system of free trade, which perpetuates monopolistic rent and considers the rate of interest of little moment.

If Mr. Borland is not now "knocked out," he is propped up from behind. If he yet possesses his economic scalp, it is glued on. I shall have to say, as was said of Ephraim, of old, "leave him alone, he is joined to his idols." But I offer this alternative proposition, make actual, individual "use and occupancy" the only valid claim to land, thus abolishing "monopolistic" rent and leaving only natural or "economic" rent and then, if the taking of economic rent as a tax constitutes the single tax I am with the single tax, as far as it goes.

N. B.—Mr. Borland says:

His jumble of words concerning Kansas corn and Pennsylvania coal is a mass of misconceptions which would take pages of space to straighten out.

The appearance of the word "coal," as applied to Kansas, was an unfortunate error, typographical, or in copy, as Mr. B. might have seen from the context. Thus amended I defy Mr. B. to disprove the argument, without at the same time destroying all his own argument about "natural margin." To make it easy, change the word corn, in each instance, to wheat. Then let the boundaries of England be the line *a*, the unused land in England the quantity *b*, and extend the line *c* so as to embrace the United States and India. Now let England increase her area of cultivated land until she is able to feed herself with wheat bread, and see what will happen in the United States. The result will be similar to that which has been produced by the stimulation and development of wheat raising in India, caused by the demonetization of silver on the part of the United States.

## MISDIRECTED ENERGY.

BY THOMAS PRAY, JR.

If we saw a man hauling home in a cart only a spool of cotton thread, it would be only natural for us to say it was a waste of time and effort. So it is in the matters of life, if we undertake anything not consistent in its result, or productive of some useful effect, it is "misdirected energy," and it is one of the most cogent of the whole realm of nature's works, that effort is neither misapplied in its combinations or misdirected when results are wanted. But with men it is on a different scale. Who does not know some unfortunate who has left a job of "pay dirt" for some visionary scheme, in which his intentions were to accomplish some result in such a way that money was to flow into his hands like water from a mountain stream? only to waken sooner or later to the stern reality that his knowledge of the matter was not in any sense complete, and as a finish he was glad to get into harness again and earn his day's pay, not to search for shadows.

Webster will tell you if you consult him, that energy is internal or inherent power, capacity of acting or producing results, etc.

If energy is rightly applied it is the one factor that drives all before it, and if it is misapplied, it is the most reckless waste of time, money and result, that is to be mentioned. When men undertake anything, then, it is most proper to attend to in the first place thoroughly informing yourselves of what you are to undertake, then try to get at any possibilities as to any improvement that can or might be made on the application of it, and then to do them with the least number of parts and most direct effort.

It is as well to also thoroughly know what is not wanted, as it is in some cases what is wanted, or what may or can happen. Sometimes men fail, by reason of not doing this, and at other times they make sad blunders, by trying to compel old Dame Nature to conform to an idea of theirs, and when they reckon on this she is apt to disabuse their minds of their own conceit in a way that costs many dollars and trouble as well.

Some of our readers may have seen a reference to the slump in the roof of one of the great exhibition buildings in Chicago of late. The newspapers told the truth as near as railroad men tell it, when there is an accident. It was only a little "trip up" of some energy in the wrong place. Nothing only the man who planned the joining of some roofs in such a manner that it left a fine place for any snow or water to gather in tremendous quantity and it was also impossible to get it out or off, but the snow storm was not to come, and

it did, and the confined weight was so much more than the calculated weight, that the roof went in on the floor, and the calculations did not work. It is well sometimes to fully consider what may come, as well as what is likely not to come; for as General Garfield often expressed it, "the unexpected is most likely to happen." So in all the affairs of our day by day existence, it is the unexpected that does happen, and it changes our plans to such an extent that sometimes we do not really know what we tried to begin at, or to stop on. When a man tries to do the best he can, and does not succeed as well in results as he wished to do, he is not at fault, for he has done his best, and it is all any one can do, but when he could have done something different and does not, then he is to blame, for he has not done his best.

Proper regard for a man's position requires him to do all in the possible for the man who pays him a certain stipend for his time per hour, day or week. Anything short of his best efforts is only another way of stealing from his or her employer.

The man who designs either a roof or a steam cylinder, needs to be at his best, and not to incorporate any new or untried elements without carefully satisfying himself that there is either less cost, less repairs, or some factor in which the owner is to have a direct benefit, for if the owner of a plant allows some one in whom they have confidence to go on and to design, improve, or replace with new, some of their plant, it is a violation of confidence if the one doing the work does not do it in the most conscientious and painstaking manner, and when that is on the hands, nothing else should enter that has the most direct or remote tendency to allow any other motive to creep in.

Some of the "compounds" of this day, are the result of ignorance of the laws of steam, as well as of the higher, less regarded moral law of one man's obligation to another who employs him, or his firm, and this is one of the places where a man may easily misdirect his whole life's work, by dis-regarding his higher obligations, and it is true that some of those who have found that "every man has his price" and that the price was low when it came to be measured by the higher standard of light and truth. We often hear of changes in business circles, deficiency in accounting, and other matters, where some one had in his way of putting it, been in a crooked way and was found out and discharged from a position in a day, to which he had for twenty years or more been toiling, to attain. There is a good deal too much of this, and it don't pay to steal, if you do have a chance. It is too expensive, and it is easy to tell what a man has done, but who can tell what he will do the next day?

There is getting to be too much of the high art entered into some of our work, and in many cases it is the high art of deception. Young men often sigh for the easy place of a man who has been twenty or forty years in getting at a competence, but the quickest way in the world to get at it, is to go ahead right and with a determination not to do it by the short cut, for there are too many things

in shape of a man who are looking out in life for the "soft spots," and too many there be that find them not?

As the magicians practice all sorts of fantastic tricks on people by means of mirrors, so it might be well for young men to look into their personal expectations, and mentally at least, not commence to deceive themselves by using either a concave or convex one in order to either diminish their faults or to magnify their virtues. Better have a plain flat one and use it in a good light honestly, for every young man or woman to a far greater extent than they are aware of, form as with iron bands, their character before they are twenty years of age, and it is far easier to do the preliminary work rightly, than it is to undo it, and commence over again after the active work of life has been entered on in that earnest way that is productive of success, and after we enter the arena for ourselves. It is a terrible waste of time to be undoing, and doing over again that which ought to have been done once well, and then the time lost in these efforts, when we should be making progress. Think often of "are you misdirecting your energies?"

Question Box? "What is specific gravity, and how applied?"

The term is from the latin, "Species Gravis," meaning a particular sort or kind, and weight or heavy, or as it is applied, in all the practical questions of life, "The particular weight of any substance as compared with water," and we have a fixed standard of water in its weight as 1. Other substances are weighed in or out of water, and their weight is as compared with water. Thus, if we wish to get at what a casting would weigh, we get at the cubic inches of the casting as near as is possible by computation, and then we easily find the weight by the simple multiplication of the inches contained in it by the weight of one inch of cast-iron. The specific gravity of cast-iron is 7.207, or it is that number of times the weight of the same volume of water at 39 degrees Fahrenheit. The weight of a cubic inch of cast-iron is .26066 of a pound, a cubic foot of it weighs 450.44 lbs., and a square foot of it one inch thick weighs about 37.5 lbs., as every foundryman knows. There are a great variety of amusing and instructive experiments to be performed with a little apparatus for the family in which specific gravity takes a part, but in the affairs of construction or design of machinery of steam work it is an important factor. Tables of specified gravity are to be found in many of the newest text books and standard works, but in some of the hastily prepared and unverified books put out the tables are very erroneous and clearly misleading.

Some of the recent text books assume the metric system. All such should be thrown aside, for in our daily work the so-called metric system is a delusion and a snare, and the works of William Sellers & Co. in Philadelphia some years ago tried to conform in one or more of their departments to this so-called system. They found that bright Germans as well as Frenchmen who had been thoroughly schooled in its use at home, when they came here were in a few months glad to drop it and use the sensible if old-fashioned "inch," and this great firm found that their work cost them more with this

botch system than with the inches and common sense. It is well enough to know how to convert the so-called metric measures into our inches, but it is fun (?) with the fun left out. Here is the data for "the boys:"

One metre is equal to 39.3702 inches. Rogers.

One inch is equal to 25.399772097 millimetres.

One foot is equal to 304.79724 millimetres.

One square metre is 10.7641 square feet.

One cubic metre is 35.3156 cubic feet.

One square millimetre is 0.00155003 square inches.

One kilogramme is 2.20462 pounds.

There is one thousand millimetres in a metre, and if some of our readers will figure out the diameter of their piston rods in the metric slang, they will have fun on their pencils or slates. It is a beautiful system. (A good ways off.)

## ECONOMY.

BY WILLIAM WEILER.

Mr. Moore, in his talks to young engineers, in the March MAGAZINE, advises the use of economy in fuel, and Mr. Borland writes of the same in supplies, and both are good articles and deserve the attention of the men for whose benefit they were written, even if they are but the belated echoes of repeated articles in the other earlier volumes of the MAGAZINE, in which I have endeavored to impress the practice of economy upon enginemen, as a duty they owed to themselves and the companies in whose employ they may be, as the practice of this virtue might mean all the difference between a bankrupt and a paying road, and fair wages paid on time, or poor wages paid several months overdue.

Mr. Moore says that often more coal is used while firing for some engineers than is required on the same engines and runs, made under the same conditions, by other engineers, and this but corroborates my own experience. Years ago (but not so long ago that I have forgotten it or the lessons I then learned) I fired a consolidation hard coal locomotive with a ten foot fire-box, on a wilcat run. She was a comparatively slow steamer, but sure to keep up to the maximum mark if given a chance, and in my six or seven months' service with one engineer there were not more than two failures to have her right up to the mark. The exigencies of the service took this engineer away from me to another part of the road, and I had another man put on with me and continued on the same engine and run. I soon found out that I had to use more coal to fire for No. 2 than I had used with No. 1, and that I could not keep her up to the mark for No. 2, in spite

of my best efforts. First I was inclined to blame myself for inefficiency, next I blamed the engine for getting old and worn out, but after a while I had some engineers make a few chance trips with me in the place of No. 2, and found it was neither mine nor the engine's fault, for I could keep her up to the mark under their management. I of course had to, after that, blame engineer No. 2 for the difference, and still I had, according to the old phrase, to "grin and bear it," (the new version, I believe has it, "suffer and be still,") but I must admit that it seemed like an imposition on good nature to be obliged to shovel from a half to three quarters of a ton of coal more every day, and then to be able to only keep her nearly—not quite—up to the mark. Of course it did not take this extra fuel all at once, but in extra shovelfuls here and there, but the result of a day's work showed up all the same, in the difference in the pile left over to commence with the next day. I often felt convinced that the amount of my wages was worse than wasted every day, and that if the same rule held good in other instances much might be done in the way of saving fuel and labor, and since I have been at the throttle my aim has been to make work as easy as possible on my fireman, and as a result also as easy as possible on the company's fuel pile and fuel account, and I flatter myself my efforts have been in a great measure successful, for, unless a number of firemen lie, they have made trips with me, using far less coal than is usual, and not being far behind in the rate of speed either.

A saving of only two cents per mile on a mileage of 4,500, (not unusual, I believe), amounts to \$90 per month, or with a thousand locomotives to \$90,000 per month, or to the grand aggregate of \$1,080,000 per year—a sum which would not come amiss to any one, and which even our largest corporations would be glad to appropriate and be in a measure thankful for. As such grand results may be accomplished by savings, let us not ignore the little things, but ever bear in mind our childhood's song—

"Little drops of water,  
Little grains of sand,  
Make the mighty ocean,  
And the beauteous land."

"Isn't she a daisy? Just hear her cut it off!" How often do we hear enthusiastic admirers of some locomotive give vent to their feelings in the words above quoted, just as if the amount of noise she made was an indication of her value as a worker, instead of it really being an index of a large amount of power allowed to escape without having rendered an equivalent for the labor and fuel used in making steam. It is this idea of judging by the noise which no doubt influences some engineers to run their locomotives a notch or two nearer the corner than it is necessary to do the work, and to think that because she makes a great racket she is doing her full duty.

The noisy, babbling brook, that we can step over, makes more commotion and fuss in its passage over the first few miles of its rocky

bed than the majestic Mississippi or the grand Hudson, which are strong enough and broad enough to carry the commerce of the world upon their bosom. Hence we have the German proverb: "Still waters run deep."

Apply the rule to men, and you will find some supplied with a few set phrases of small talk, who shine in society, or some that have an unabashed self-esteem which permits them to air a few thoughts clothed in stilted language, and are called orators, while the man whose deep study and thought has enriched the world through his pen, goes along unrecognized, and often even reviled.

Even so it is with our locomotives; it is not in the amount of noise made that we find merit, but in the amount of work done with the least fuss. While it is true that from the very first trip the ear of the fireman and prospective engineer will listen for and find music in the exhausts, it is equally true that it would be better for all concerned if the locomotive did not make that noise, or at least not quite so much of it, for it would show that more of the power of the steam had been imparted to the pistons, and through them to the movement of the train. An appreciation of this fact has led to the adoption of large exhaust nozzles, and is also responsible for the invention and introduction of the compounds, which by using the steam twice obtain more work from it and discharge it to the air under a lower pressure than is possible with the ordinary locomotive. In the production of steam, and the burning of coal to produce it for locomotive use, we are confronted with perplexing problems. In the first place, we require a large amount of steam from a boiler, which is by circumstances under which it is used limited in size, and then it must be fired by an equally limited grate surface. In order to obtain steam under these circumstances forced draft by the exhaust had to be resorted to, but in so doing other disadvantages were introduced and the great question of the day in economic railroad management is how to minimize them as much as possible.

To obtain the strongest draft on the fire, the end of the exhaust pipe is capped with nozzles, which by their smaller opening impart a greater velocity to the steam than it would have through a wider opening, and this enables us to make steam enough to meet the demands made by the insatiate cylinders, but having succeeded in this object we have introduced the evil of throwing sparks to the danger of all property along the line of the road, and nettings, cones, deflectors, what not, of all shapes and sizes have been designed and applied to sieve, screen out, or ensnare these particles of fire, and have had only a partial success, for in proportion as they accomplished the catching of sparks they also retarded the exhaust, thus destroying its effect on the fire. As the subject of a free and unchecked draft in the smoke stack is hedged about with this difficulty, some attention has been given to the matter of grates, and some of the first efforts in this direction were to try to obtain more grate surface by arranging the water and grate bars in a zigzag line across the fire-box, but this plan has not proven up to the mark for it has been abandoned, and well it might be, for if the bars had been placed in

a straight line they would have made a solid bottom to the fire-box, and the air in rushing through them at the demand of the exhaust was greatly retarded by its torturous, winding course. Of late, however, some of our progressive designers have again taken up the idea of making an improvement in the grates, and this time it is in the way of reducing the size of the bars and enlarging the air spaces between them. Improvement along this line is possible, for in many instances locomotives which have been designed to secure the largest possible grate surface are deprived of the advantage they should have as a result of the enlarged surface by having it filled with grate and water bars about two inches in diameter—having, in many instances, less than one inch air spaces between them—and thus virtually acting as a damper that closes two-thirds of the grates. If the grates were so constructed as to give one-half or possibly two-thirds of the grate surface to the admission of air it would assure a less rapid draft through portions of the fire and distribute it more evenly over the whole fire, thus securing a better combustion of the fuel and also in a great degree diminishing the spark nuisance. Let us hope the investigation now started on this line may lead to tangible result, giving us freer steamers with less noise and less fire to burn our clothes or to make a mark all along our backbones, and which will also prove equally good for the railroads by keeping down the fuel account to to a reasonable limit by insuring a more complete combustion and reducing the danger and expense from fires kindled by the sparks.

---

## UNRELIABLE STARTING POINTS.

---

BY THOMAS PRAY, JR.

---

A member of our regular Firemen's Association has sent to the writer a copy of a monthly advertising paper printed in New York, and asked attention to what an article means that is supposed to be the way to get at the evaporative capacity of a boiler, from the way the water falls away in the gauge glass. It may interest our inquirer to know that the paper in question is edited, in so far as the name at the head of that column goes, by a man or person who never ran a steam boiler or engine, as engineer, one single day in his life; and it is reasonable to say this in the outset, for what a man don't know he is not to blame for, and in some cases it is not necessary to know the blow off from the bar a man frequents, to be able to edit a paper. This don't apply to our MAGAZINE.

The article in question is good as far as it goes, but it don't go very far when it is analyzed with care; it tells how to not do it, in the writer's mind, and so far as the actual experience goes, it is not worth following; but here is the "what is it:"

Set up a stick between the flanges of the water gauge, then have a box built 10x10x15 inches in size, then having this done, draw off water to fill this box and mark on the stick with a lead pencil, the place that the water level is at. Do this several times so you can, when ready to make a trial of this method, run the water down in the boiler, having stopped the feed; and when you have this done then you assume that so much water does so much work, and there you have it. And then to prove it, the formula on which Rankine based the density of water at different temperatures, is introduced, and then we assume some more—that thirty pounds of water does a horse power for an hour. We will give the original source of this wonderful information credit for saying that this is a way to do it with reasonable accuracy; and now let us have the facts as we are to understand them.

Suppose one of our locomotive firemen was to lay in with the man on the right hand side to try this sort of a speculation. It is easy to set in the stick and to get the box into proper dimensions—that is what the railroads keep carpenters for—and the two men could do the getting ready when they were in off the line, so to be ready when out on the run; that is what engineers and firemen are for, and as they have nothing else to do it would be easy. But, what does it all amount to when done? Suppose it is possible to do as the dude has it figured out, are we to understand that steam has the same physical properties under all circumstances, and that we can get at the bulk of water just the same when it is cool as when it is under a pressure, and with what to correct it, then does it, as a matter of fact, happen to be the fact that steam, with no feed entering the boiler, has the same calorimetric properties as when it is under usual conditions? And how would a comparison do with the following the trial, with running the feed at a red hot speed to get in the amount of water needed to insure safety, and to resume business at the old stand, and with the usual amount of brains in the tank? Of course these little items of safety are not to be considered when we are after a test, but when we seek for the reason why, then we find, first, that it is not possible to figure out the horse power from the depth of the ash pit nor to get at the temperature of steam from the size of the safety valve in square inches. We can take a pine box and get it so it would hold a cubic foot, but in this case the one used neither holds a foot or a gallon; it is easier to make a lot of figures, but that is what education is for; but it is not the way to educate men who are looking for some sort of a practical way that will not mislead them when asked to give commercial results.

Now it is a matter that any one of our boys knows, that the same box filled with water, commencing at the upper part of the shell of the boiler, would make a mark at one distance, and if the water was measured in this way until it was down to the half way point, no two marks would be the same distance from each other, and the way the steam would act in its being led out, would vary quite a good amount in the moisture present, and to run down to or below the top row, would, in some cases, make a good job for the boiler maker.

Then when we begin to assume, why not save all this foolery, and guess at the whole thing; it would be as easy and quite as correct.

Thirty pounds of water makes a horse power. This is true in some ways, and it is also true that a society of so-called engineers, some of whom are engineers and some of them are not, have agreed to an arbitrary standard, for comparison, which makes the thirty pounds of water into a horse power. But does this work with the old stagers that call for forty or fifty, and who refuse to do any work as soon as they are cut off on their full supply? And how as to these economical compounds, that use only a few quarts of water and just enough coal to convince the fireman that he is still to use a shovel, are they to be tested with a stick and a box? We had almost said "by a jack in a box."

There is now a growing disposition to belittle the scientific tests of the dudes and the men of "larnin;" and if this article is the kind of high mathematics ground out to sell to men who are earnest in their desires to promote themselves by getting at the facts, then it is high, not low, time that something that is sound is put where they can become familiar with the correct way of doing, if at all, such an important thing as to test what a boiler is actually doing, instead of guessing at it. This same paper, some three years ago, while the writer was employed at the New York navy yard, on steamship work, came out with the astounding information that it was not necessary to use right and left hand indicators. But the world still stands; so with this lack of a method of finding out what a boiler does. The way is, to measure the horse power with a reliable indicator, and to weigh the water in its passage into the boiler and then to weigh the coal, just as any sane man, who had any proper amount of brains, would do; and when carefully done, compute by verified formula and put down the honest results without fear or favor or without any guessing. Any sort of a computation in steam that starts or includes, anywhere, any factor that is not a positive one, is at once unreliable, that is all.

Some of the literature of the steam engine now on the market is older than Noah, and as reliable as the usual weather prophet's predictions or the politician's promises; but in all of it there are natural uncertainties to contend with without the interpolation of worse than uncertain quantities, and the density of water formula is only the outcome of an utter disregard for the facts, whether to show off in mathematics, is not for the writer to say, but it is mathematics, with no regard for the facts, and it is as easy to guess at the whole thing as at a part of it.

In the affairs of life, in a commercial way, there are plenty of men who are willing to avoid honest labor, as the way to earn promotion, and take the short cut; but the man who does not have to imbibe to get his head into working trim, can far better be honest with himself, and take the old way, and be true in his dealings, if he does not get there so soon, will surely not be liable to come down on his back, nor like the rocket's stick, after the whizz. Steam has been one of the most interesting of all of the physical substances, and it is still

one of the most entertaining, but it is elusive, and not easy to get at closely; it has plenty of the best brains now looking into it, as well as many a bungler, and we have to examine with care all the information put forth, sometimes at the expense of too much time and effort, only to throw it overboard.

The way is open to sober men who have sound discretion. Lots of room up stairs yet.

---

### CONTEMPORARY COMMENT.

---

The engineers and firemen of the B., C. R. & N., at Cedar Rapids, Iowa, have organized what they call the "Locomotive Educational Association." They have rented rooms and fixed them up in neat shape, put in a valve motion model and some good books, and are discussing live subjects relating to their work. All this can have but one result—better posted enginemen. We notice in their plan that members are expected to ask questions and make statements; this is hard to do; men, especially engineers, dislike to ask information on subjects that they are supposed to know about. Some experience of the writer in this line developed a better plan; we had a "question box," a cigar box with a slot in the cover; into this any question about locomotives or rolling stock could be placed; no one knew who asked the question; these were taken out at random and the subject talked over. This plan prevents embarrassment and lets the information sift through the service, a benefit to all. We are glad that the master mechanic, general foreman and traveling engineer, all take an active interest.—*Locomotive Engineering*.

Any one who has ever taken the trouble to look into the matter has found that men who drive and conduct street cars are usually made to work unreasonably long hours for very small pay, and when there is a strike for the purpose of improving matters or to resist further encroachments, they usually have the sympathy of the public. The latest proposition is to place in street cars mail boxes, not for the convenience of the public, but so that the chances of the men winning in contests with the companies will be reduced. It is doubtful if the Postmaster General can be induced to lend his aid to such a scheme, but if he should do it we should say that he would be using the power of the government in pretty small business.—*American Machinist*.

The railroad from Jaffa to Jerusalem, which has been lately opened for business, is 54 miles in length. At present the journey takes three hours, but when the road is fully in order and the road-bed settled a decrease in time to two hours will be made. The company has the concession for several lines and work has already been begun on two branches. The first starts from the main line at Ramleh and will be built this year to Naplouse, 31 miles; this road is the beginning of a line to Damascus and Upper Syria. The second branch also starts from Ramleh and is to run to Gaza, about 47 miles; from Gaza it will be extended hereafter to El Arich on the frontier of Egypt.—*Railroad and Engineering Journal*.

A young man writes to a contemporary that he has built a small compound engine, the h. p. cylinder thereof being  $1\frac{3}{4}$  inches diameter and the walls  $\frac{1}{4}$  inch thick. He wishes to know if it will "burst." The editor says it is safe at 50 pounds pressure, but to be entirely safe he should throw the cylinder in the scrap heap. This is rather hard on the young man, and shows how easy it is to get misinformation. Many steam yachts are running with 12-inch cylinders with three-eighths inch walls, worked at 180 and even 250 pounds per square inch at times.—*The Engineer*.

The compound built by the Pittsburgh Locomotive Works, which we illustrated last month, is giving high satisfaction in service. She went to work pulling trains without a single change. The engine has been running on the Pittsburgh & Lake Erie, the Columbus, Hocking Valley & Toledo, and the Cincinnati, Hamilton & Dayton. All the men in connection with these roads admit that the compound has badly beaten the simple engines in fuel economy.—*Locomotive Engineering*.

A new oil field has been discovered in Sumatra, and from test borings it is thought that oil will be found over some 400 square miles of country. Wells already bored at Langkat are yielding from 3,000 to 4,000 barrels a month. The oil is reported as much better than that from the Baku wells in Russia and equal to good Pennsylvania oil. The oil district lies on the coast, where shipments are easily made. The Dutch colonial authorities have granted many concessions for wells.—*Railroad and Engineering Journal*.

### SOME THINGS TO REMEMBER.

The following questions and answers are from *Locomotive Engineering*:

J. D., Chicago, Ill., writes: One authority asserts that it requires from  $3\frac{1}{4}$  to 4 pounds of air per pound of coal for perfect combustion, while another claims that it takes 12 pounds for perfect combustion and 24 pounds as it takes place in the locomotive. Who is right? A.—Combustion is the chemical union of carbon and oxygen and the combination of 12 parts by weight of carbon to 32 parts by weight of oxygen. It takes 4.35 pounds of atmospheric air to supply one pound of oxygen, so it will take close on 12 pounds of air to provide enough oxygen to combine with one pound of coal. In the rapid combustion of locomotive fireboxes, the burning fuel has to be saturated with air, and it is calculated that complete combustion cannot be maintained unless from 20 to 24 pounds of air is passed into the fuel for every pound of coal burned. 2. Do different kinds of coal require different quantities of air? A.—Yes. The quantity of carbon or hydro-carbons present in one quality of coal may require more or less air than coal with different constituents. There are also certain qualities of coal of a refractory nature that seem to need a hurricane of air blowing into the mass to effect combustion. 3. What percentage of the air that is admitted to a firebox escapes through the stack and what percentage is consumed during the operation of combustion? A.—The coal that burns enters into combination with oxygen in the proportion of 12 to 32, or 12 to 16, if the supply of air is restricted. All the air not deprived of its oxygen by combustion in the proportions mentioned passes out through the stack.

J. S., Jackson, Tenn., writes: We have several Rome engines and the point in suspension of the saddle-pin is  $\frac{1}{8}$  inch out of center. The radius is 100 inches, blade-pin holes  $11\frac{1}{2}$  inches apart. The engine uses more steam in back end of cylinder than front. I would like to know the rule by which they get the pin set back  $\frac{1}{8}$  inch. We take half the distance between the centers for the saddle-pin. A.—The correct location of the saddle-pin to insure an equal cut-off in both strokes is a much more complex problem than our correspondent realizes. A variety of parts of the engine's machinery influence the location of the saddle-pin. Among these might be mentioned the ratio of crank to length of main rod, the radius of link and the location of the blade-pins, the length of the link-hangers and the location of the tumbling-shaft. Besides these the angular advance of the eccentrics and the travel of the valve have to be considered. Full particulars of this problem may be found in Meyer's "Locomotive Construction" or in Sinclair's "Locomotive Engine Running."

J. B., Chicago, asks: Why is it that one can start a screw with a long screw-driver when you cannot move it with a short one? A.—With a long screw-driver the inclination of the perpendicular gives an increased leverage.

# WOMAN'S DEPARTMENT.

EDITED BY IDA A. HARPER, INDIANAPOLIS, IND.

## PROGRESS OF EQUAL RIGHTS.

The opponents of woman suffrage seem to take a certain satisfaction in declaring that the movement is making no progress whatever and that, in reality, it is retrograding. There is absolutely no foundation for this statement, and we do not believe it would be possible to give a single instance that would prove such an assertion. On the contrary, from every direction come reports which show that the cause is steadily gaining ground and that there has been a great change of public sentiment in its favor. In looking over the field we find that in one half of the states in the union, women have school suffrage; in Kansas they have municipal suffrage; in Wyoming they have full presidential suffrage; in a number of states they have local suffrage on such questions as the building of railroads, sewers, stock laws, &c., and the sale of liquor. Within the past year the school suffrage has been granted in the large states of Illinois and New York. In not one instance where suffrage has been given has it been taken away. In every state where it has been exercised in a modified form a public sentiment has been created which favored its extension. The Governors and Senators of Wyoming, where women have voted for twenty years, speak in the highest terms of equal suffrage, and they insisted that it should not be admitted as a state except with this provision in its constitution. In Colorado, where women vote on school questions, the Governor said in his recent message:

About eight years ago a law was passed giving the women of Colorado the right to vote at school district elections; and inasmuch as since that time the heavens have not fallen, and the efficiency of the public schools has greatly improved, I recommend a law extending to the women of Colorado the right of suffrage at all municipal elections.

These are some of the results of the last twenty-five years, and do not indicate that the cause of equal suffrage is retrograding. It would be impossible, in the space of a single magazine article, to enumerate the changes that have been made in the different states in the laws relating to women; or to point out in detail the enlarged opportunities that are given them in the various professions and industries; or to call attention to the splendid educational facilities that are extended on every hand. These things have not come by chance, but have been secured by persistent and courageous effort, and in every instance it will be found that the promoters belonged to that class who demanded, all the time, equal political rights, but at the same time labored to secure these other privileges as a step forward to the

desired end. This is not merely an expression of opinion, but is a statement which can be verified by any one who cares to study the history of these progressive movements. Every woman who is to-day enjoying any of these advantages and at the same time scoffing at the advocates of equal rights, is guilty of ingratitude to her benefactors.

But, without permitting any of these side issues to come into the discussion, let us glance for a moment at the present status of the woman suffrage question. Not long since an amusing "remonstrance" was circulated by some women who had not the courage to sign their names to it, begging that the subject of equal rights might be dropped as it was already a failure. To prove this they stated that it had received a negative vote in one-half of the legislatures in the country. It did not occur to them that a few years ago it would have been impossible to secure any kind of a vote on this question in any legislature, but it would have been treated with ridicule and contempt. The very fact that it passed through the necessary process and came to a vote in one or both houses in so many legislatures is the surest evidence that it is making progress. During the winter just passed woman suffrage has been considered by legislatures in all parts of the country. This article is written in February and it is impossible to predict the final results, but at present the situation is as follows: The judiciary committee of the United States Senate has handed in a report favoring woman suffrage; a joint resolution to submit an amendment giving full suffrage to women has passed the Kansas Senate; a municipal suffrage bill was defeated in the Missouri House of Representatives by a vote of 68 to 45; the Illinois legislature is considering a bill to extend the suffrage so that women may vote at all township elections; a bill to give women school suffrage has been introduced in the Connecticut legislature; to grant municipal suffrage in the legislatures of Minnesota, Indiana, Nebraska and California. The bill in California is supported by a petition containing nearly 21,000 signatures. In South Carolina a change of four votes would have carried the bill through the Senate. The Colorado House of Representatives passed the bill granting municipal suffrage to women by a vote of 39 to 21. In Vermont a similar bill was passed in the lower house by a vote of 149 to 83. In New Mexico a bill granting full suffrage to women has passed both houses.

The strongest fight has been made in Massachusetts, for a bill granting municipal suffrage to women. They have had to encounter not only the very conservative sentiment of the East, but the tremendous influence of the liquor element in Boston, where there are 10,000 saloons. The greatest interest was manifested and the legislative halls were packed to overflowing whenever the subject was up for discussion. The woman suffrage cause was advocated by Mrs. Julia Ward Howe, Mrs. Livermore, Mrs. Lucy Stone and a number of other distinguished women. The remonstrants were represented by one lone, lorn woman, who had never been heard of before, the wife of a Baptist minister, Rev. Daniel Faunce, of West Newton, a suburb of Boston. She said, among other things, "I have to pay a tax but I am

willing to trust the money to a man. Honest women do not want suffrage. The percentage is 100 against it." This statement was hardly supported by the fact that 10,000 women voted in Boston a short time before for school trustees, and the petitions to the legislature, asking for suffrage, were signed by over 50,000 of the most respectable women in Massachusetts. A number of Representatives spoke on both sides of the question. The vote resulted in ayes 101, nays 111. The bill was defeated by ten votes out of 112. The bill was supported by the Central Labor Union of Boston, representing trades unions of more than 60,000 workingmen. It was also advocated by a number of prominent newspapers. As this was by far the largest vote the question ever received and there was evidently a much stronger public sentiment in favor of it than ever before, its friends find much cause for encouragement.

The bill providing for a constitutional convention in New York has finally passed both houses, been signed by the Governor and become a law. It distinctly provides for a representation of women, something that has never before been done. In Detroit, Mich., an effort is being made to have incorporated in their new charter a clause permitting tax-paying women to vote for city officers, and all of the city papers are said to favor it. It is difficult to see upon what grounds one could oppose the right of a citizen, who pays her taxes, to vote for the officers who levy and spend these taxes. There has been no attempt in this article to make an argument for woman suffrage, but only to answer, as briefly as possible, the oft-repeated assertion that interest in this subject is declining and that it is making no progress. There are no facts to prove such a statement. Every advancement made by woman in any line is a step toward an absolute equality of rights. The possession of the franchise is what creates individual sovereignty, giving men the power to enforce their demands. Where would be the strength of labor organizations, for instance, if they were not backed by the influence of the ballot? The press, the politicians, the legislators, would laugh them to scorn. "By this sign shalt thou conquer." We are allowing women full swing in the business world; we are permitting them to earn and to hold property; we are giving them an education, that lever which will move the world; we are granting them practically every position which they ask for; we are teaching them the necessity of organization and coöperation. Does any one believe that all this can be done and that then the edict can be issued, "Thus far and no farther," and they will accept it? On the contrary, they will say, "All these things we have received as a favor; men gave, men can take away; we want the power to protect ourselves, to claim by right what now we have by sufferance; to rid ourselves of having to beg as a favor what, as American citizens, we are justly entitled to. This can be obtained only through the exercise of the franchise; therefore we demand the franchise." This is the only logical sequence to the great progressive changes that are taking place in the status of woman, a fact that is being widely recognized and conceded, and there is a steady increase of public sentiment in favor of it. How soon or in what manner it will come it is impossible to predict, but it surely will come.

## OUR CORRESPONDENTS.

A number of well written and properly signed contributions have been received this month, and also private letters expressing approval of the new course adopted in regard to the correspondence. The rule will be strictly followed, to publish nothing without the correct name of the writer. We believe the good results are already apparent. Our contributors will please remember to place a suitable title at the head of their articles, their name and their place of residence at the foot; the date is not necessary, as they cannot appear until the second month after they are written. For instance, those sent in April will be published in the June MAGAZINE. We would like the opinion of our writers on the subject of Dress Reform. It is being prominently discussed and is considered of sufficient importance to have its own Committee in the Woman's Congress at the Columbian Exposition. Do we need reform and what shape shall it take?—Miss I. B., Cumberland, Md.; please let us know if the poem you send, entitled "The Engineer's Prize," is entirely original with yourself. If it is, we will use it.—"Ruth" S., Englewood, Ills.; your letter will be published if you will send us permission to use your name.—Miss Ida Orrell, Murphysboro, Ills.; your articles and those of Mrs. Orrell, all were prepared and sent to the publishers. I will ascertain why they have not made their appearance in the MAGAZINE.—"Gladys," Escanaba, Mich.; we will hold your letter for permission to use your name.—"Jessie," Makanda, Ills.; if you wish your article, "Adrift on the World," published, you will have to send your name.—"Tuppylin's Wife," Houston, Texas; your last letter will be used if you send your name. Your description of a New Year's ball would hardly interest the readers of the April MAGAZINE.—"Adelaide," Escanaba, Mich.; let us hear from you again.—"Maggie Williams," Telluride, Col.; your letter is worthy of publication and will be held long enough for permission to use your name.—Correspondents who are not mentioned may know that, for some reason, their letters were not available, always remembering that articles are sometimes delayed for several months.

## NOTES.

Every month we receive one or more requests from correspondents asking the editor to send a personal letter to the writer. Sometimes they say that she has been an invalid for a long time, or that she feels the need of sympathy, or that she would like a letter as a keepsake. These requests touch a tender spot and it would be a pleasure to answer every one of them if it were possible. Our correspondents can hardly realize what it is to be too busy to write one letter that is not absolutely necessary. In addition to my regular newspaper, mag-

azine and syndicate work, and just at present a large amount for the Columbian Exposition, I am obliged to write no less than a thousand business letters during the year, and as I do not keep a secretary this is no small burden. It seems to me as if I almost live with a pen in my hand. Our friends will excuse this introduction of personal affairs into this department. It is done only to show how impossible it is for me to write to our individual contributors. I frequently keep their letters on file for several weeks, hoping for a few moments, leisure, which never comes. This will explain why such letters are not answered, although I have the warmest personal feeling for the writers.

In the January number appeared a little sketch entitled "Our Dead Hopes" and signed "Elsie." The name of the writer did not accompany the manuscript but it was used on account of its merit. Miss Ida Orrell, of Murphysboro, Ills., writes us that the author is Mrs. S. C. Hazlett and that it appeared in the September number of "*Woman's Work*," a magazine published in Athens, Ga. Of course, we have no means of identifying the writer who purloined it and imposed it upon our Woman's Department. This shows the necessity of the new rule requiring everything to be signed with the correct name of the writer.

## CURRENT COMMENT.

We have an illustrious example in Geo. W. Childs, owner of the Philadelphia Public Ledger, of the immense amount of good that may be accomplished by a man who consecrates a portion of his wealth to the uplifting of humanity. The list of his benefactions is a long one and many of them have been so quietly made that they never will be known to the public. Mr. Childs has educated between three and four hundred girls, who have come from all parts of the union, and he says he has been amply rewarded by the success they have achieved, and then he utters this splendid sentiment:

It is not generosity that has made me helpful in this respect to girls; it is in part selfishness. I want to see where my money goes. I want to know that it is circulating; that it is doing good. I sometimes feel that the only money I have is that which I have given away. The rest is just waiting.

He says also that all he asks of these girls in return is that they shall be helpful to other girls who need it, and he concludes by saying, "I think the help I have given women and girls has been productive of more good than that which I have given men and boys." When the editor of this department was presented to Mr. Childs, a few months ago, he said, "I am always glad to meet women who are

engaged in journalism. The most satisfactory work I have ever had on my paper has been done by women." When it is remembered that the *Public Ledger* is one of the largest and ablest newspapers in the United States, the value of this compliment to women writers can be appreciated.

---

The *Age of Labor*, some time ago, decided to abolish its department for women, and it states in explanation that "the vital questions relating to the interests of women instead of being confined to one corner of the paper will occupy the editorial columns and receive the attention demanded by one of the most important factors in the labor problem." This, it seems to us, is the only correct view to take. The time has gone by in which a newspaper could feel that it had done its whole duty to women by publishing a half-column of fashions, one of cooking recipes, and another of gossip. Since women have entered into all the departments of life's work they have, indeed, become an important factor in the labor problem. The fact will have to be recognized that their interests are identical with those of men and that it is a matter of self-protection with the latter to see that women are placed upon the same footing as themselves in every respect. Instead of competition there must be co-operation.

---

Miss Frances E. Willard has received a magnificent ovation in England and has been welcomed by both press and people with great cordiality and enthusiasm. She is a representative of whom the United States may justly feel proud. She is the most eloquent woman orator in the world and has probably addressed larger audiences than any other woman. She is known to more people than any woman in this or other countries, as the Woman's Christian Temperance Union has established its organizations among all the civilized nations of the globe and its President's name and fame soon become household words. Miss Willard is only a little past fifty years of age and gives promise of a quarter of a century more of great usefulness in the various reforms which are distinguishing the close of the present century.

---

Mrs. Flora Ellice Stevens, of Chama, New Mexico, as notary public, recently had to administer the oath of office to her husband who was elected justice of the peace. At the last election she had to swear in the judges. At the next election she will be herself entitled to cast a vote.

---

In Newburg, N. Y., a woman, Mrs. A. S. Oakley, is manager of the town street roller and sprinkler business. She employs twenty men and a large number of carts, and goes about with her horse and phaeton, superintending the work and collecting her fees. It may be safely wagered that the work is well done. Another woman in the same town conducts a large and successful truck business. She

has a contract to do the town trucking and has also engaged to do all of this work for a large hotel that is being built. There is no reason why a woman should not superintend such work as this and get the money for it, instead of wearing out her life on the starvation wages of a seamstress or a clerk.

An amusing story comes from a tribe in far-off western Africa. The women protested for some time against the treatment they were receiving from the men of their families, but to no avail. One morning the men woke up to find that all the women and girls had gone to join another tribe. Negotiations were at once opened and the men agreed to grant every demand if the women would return. There is a lesson here for civilized women. Men will yield whatever is required rather than do without them.

---

#### A WORD ABOUT THE CHANGE.

Our editor has toiled unceasingly in her field of labor and has sown good seed, but, in spite of her efforts, some forbidden tares have sprung up. She deserves an abundant harvest of golden grains of thought, separated from the chaff of unnecessary words and misplaced punctuation marks.

I approve of the resolution of weeding out all that is not worthy to enter our little garden spot. I say little, but who will have a greater audience? It will extend from Dan to Beersheba. We will see ourselves as others see us. We will have two long months in which to think over our reception, and whether our thoughts were really worthy of being transferred to the pages of the MAGAZINE. I wonder if the divine Shakespeare felt a moment's uneasiness over the result of his first effort. Did Jennie Lind's sweet voice falter in the first song before a critical public? There is no reason why the department should not flourish like a bay tree and send forth shoots of fresh ideas and crisp originalities. Let us start in a new furrow and help Mrs. Harper to remove the stumbling blocks that she has been tugging at for so long alone.

So, with a very doubtful sigh and the best courtesy my unaccustomed self can command, I present you to

*C. Thomas.*

JACKSON, MICH.

[I think the article you refer to has been destroyed.—ED.]

---

SCRANTON, PA., February 4, 1893.

*Editor Woman's Department:*

After reading the letters in last month's MAGAZINE, I am in doubt as to my letter being printed, but feel in duty bound to come and tell Mrs. Jones a little more plainly about my way of washing. It does not make any difference which clothes may be boiled first, but do not put dirty clothes in boiling hot water as the dirt is scalded in instead of out, but by putting in cold water the clothes are nearly clean when they come to the boiling heat. I think it is not an easy matter to explain anything on paper, but I have done the best I can.

*Mrs. Mertie Tewsbury.*

FORT MADISON, IOWA, Jan. 20, 1893.

*Editor Woman's Department:*

Well, I am truly glad some one of Fort Madison has taken an interest in our department, and contributed such a nice piece for its columns.

"If only a bachelor."

Poor Grace is catching it from all the bachelors. No, beg pardon, there was one from Weehawken, N. J., that agreed with her. Well, I sincerely hope there isn't any hard feeling existing, and we'll not say any more about you. I know it's hard to be unfortunate and then be told of it. So we will change the subject before it is worn threadbare.

I am very much delighted to see so grand an improvement on the MAGAZINE this year. It is far superior to the past numbers. Being a great lover of good pure literature I almost always have in my possession a number of papers and magazines, but must say I enjoy reading the FIREMEN'S MAGAZINE best of all, and am anxious for its arrival each month.

I was very much impressed with Mrs. Jones' letter of this number in speaking of Mrs. Harper's trip to San Francisco. I was one who enjoyed reading an account of it in the MAGAZINE, and I join Mrs. Jones with sympathy for Mrs. H's sad return. My husband and I traveled the same route as far as Los Angeles a short time after her return, it being our wedding tour. We were married Wednesday afternoon, August 3d, and left immediately via Santa Fe for Denver where we remained during the conclave, my husband being a knight. We then left for California where we spent three weeks at Los Angeles and other points of interest near, enjoying our visit at the beach most. The ocean breakers were almost too strong for me, being not of a very heavy weight. After our visit there, we came to Fort Madison, which will be our home, my husband's position being locomotive engineer on the C., S. F. & C. R. R. and he has his lay-over at this place. I like my new home ever so well, also my many new acquaintances I have formed, and I do enjoy housekeeping so much; and I venture to say my hubby enjoys his new home as much as I do.

*Mrs. Robert Eyler (Grace B. Cutler.)*

[The Woman's Department extends congratulations. Send us a captioned article next time.—Ed.]

---

LIFE'S TRIALS.

---

How little we know what lies before us. Often the sunniest, brightest days end in the darkest night and storm. So with our lives. We may live on in prosperity and happiness for years, and suddenly, like a cyclone, comes death, despair and blighted homes. How easy it is to sympathize with others. To feel that we realize the grief they are bearing. But oh how very different when it comes home to us. How truly "God moves in a mysterious way." We cannot understand. How much easier to say to a dear friend who is left alone, "It *must* be right! It *is* best, or it surely would not be so!" But when this trouble comes to us, we cannot say it. Oh no! It *cannot* be right. We were so happy. He was needed here so much. It *must* not be! Oh, why did he have to die, just in his prime, when his little ones need his support and fatherly care? We think we cannot bear it, but strange—trouble seldom kills. We are destined to have trouble in this world. Some seem to have more than their share. What would we do at such times without friends? Their kindness, love and sympathy help to soften the rough, dark path. How little they know when their turn will come.

"Leaves have their time to fall,  
And flowers to wither at the north wind's breath,  
And stars to set, but all,  
Thou hast all seasons for thine own, Oh Death!"

KEITHSBURG, ILLS.

*Mrs. Carrie E. Mitchell.*

## I CANNOT SING TO-NIGHT, MOTHER.

I cannot sing to-night, mother,  
 I cannot sing to-night,  
 Sad memories fill my heart with pain,  
 While tears bedim my sight;  
 I long to lay my aching head  
 Upon thy faithful breast—  
 Thy words of sympathy and love  
 Would lull my soul to rest.

I cannot sing to-night, mother,  
 Keen is the soul's sad wail,  
 A mournful dirge o'er blighted hopes—  
 A sorrowful, sad refrain;

WEST OAKLAND, CAL.

Then ask me not again to sing  
 The songs of happier days,  
 The voice is mute with sorrow now—  
 Hushed are those tuneful lays.

I cannot sing to-night, mother,  
 The songs you long to hear,  
 Their plaintive notes so soft and low  
 Would bring no heartfelt cheer;  
 Then clasp me in thy fond embrace,  
 With tender, loving care,  
 And kiss away the falling tears,  
 For grief is mine to bear.

Mrs. Nellie Bloom.

## ON CONTROVERSY.

Since receiving the MAGAZINE for November last I have felt like saying a few words for the consideration of those who feel disposed to discuss matters through the Woman's Department. Indeed long before that I felt the need of a word or two on the subject of this article. The true value, I think, of this department to the owners and patrons of the MAGAZINE has been the encouragement and the drawing out of expressions of original thought by those unused to writing for publication. The use of noms de plume heretofore allowed has, in my opinion, been instrumental in "nerving" timid writers to offer their "efforts" for publication; but it is not to combat the new order of things in this regard that I now write. On the whole, I think it will be better for us all to know "who we are." There are, however, many people who can bear to have their views questioned or their arguments combatted, and yet who shrink from having their motives misconstrued, their lack of common sense proclaimed, or their good morals questioned. While almost every one enjoys some pleasantry and most of us can stand a little ironical sarcasm, there are many very amiable people who can not endure to be openly "made fun of." As an illustration of what the writer thinks admissible and what should be avoided in this regard, the November MAGAZINE offers two examples in striking contrast when considered purely as disputations. I refer to the editorial article entitled, "Why Do Women Not Defend Each Other?" and the contribution headed "The Unvarnished Truth." These were brought out it seems by an article in the September number over my nom de plume. The editorial is from first to last a discussion of the subject under consideration without the remotest reference to the character, ability or motives of the writer of the article to which, I judge, it was largely intended it should be a reply. On the other hand, the other article mentioned, from start to finish, is replete with little thrusts and stabs at her opponent's morality, motives, lack of perception, and common sense; "stings," which the editor in her foot note says, "were deserved," but which, in her own statement of the "truth," she "varnished" so completely as to be entirely unsuspected by the reader. A candid comparison of these two articles will, I take it, be sufficient to convince the reader of the greater value of the one than of the other as promoters of efforts in the direction most desired. It is a matter for congratulation that the "unvarnished truth" is more in demand and much less deprecated than in former times; but unvarnished supposition, and insinuation, and misconstruction, are as distasteful to the lover of truth, candor and merit, as ever.

Let us discuss opinions, and propositions, and problems, but let us leave out personal character, and motive, and references to mental ability until such time as some one, through personal misrepresentation, attempts to benefit himself

at the expense of another, or of the common good. Let us do everything we can to extend the territory of thought tributary to these columns, and nothing to intimidate those possessed of a lesser degree of assurance.

A. H. Tucker.

[One of the hardest things to learn in conducting an argument is to avoid personalities, to discuss a question calmly and impartially without any personal references. People who feel very deeply on a subject find it hard to believe that another may differ from themselves and yet be quite as honest in his opinions. The suggestions in the above article are sensible and well-timed and we trust may be observed by our contributors. They offer an excellent reason why every one should be required to sign his own name and take the responsibility for what he writes.—Ed.]

### CORPORAL PUNISHMENT.

Having two brothers who are firemen and make their home with me, I have been for a long time a reader and an ardent admirer of the MAGAZINE. I have been interested in the different opinions on corporal punishment, and, as Mrs. L. W. K. wishes to hear more upon the subject, I will give my experience in the matter. During the first few years of my married life, I was a decided opponent of *corporal* punishment—perhaps because my mother had always believed in it, and I, during my childhood's days, had noticed that there were some very unpleasant features incident to its administration. Be that as it may, until my oldest child, a little girl, was six years old she had been governed entirely by gentle means. At that age she began to attend the public schools; soon after I found that kindly talk, moral suasion, and even mild forms of correction were not preventing her from becoming rude, ill-natured and at times disobedient. At length I saw that either I must give up my pet theory, and resort to other means, or my little girl would be spoiled beyond help. So with many misgivings, I resolved to follow the advice of my oldest sister, and on the occasion of the next act of extreme naughtiness, use the slipper. I did so, to Nellie's great surprise, mortification and *benefit!* The effect was so plainly good that I was converted, and have since had no hesitation in using corporal punishment when needed, and am to-day a firm believer in its efficacy. To my notion it is far less cruel than many of the devices mothers often resort to in order to avoid its use. A smart application of the switch or a good spanking is not nearly so likely to injure a child as to threaten it with the "bogie man," or to shut it up in a dark room and thus make it ever after afraid of the darkness; or to do as I have known some to do, deprive a growing child of a meal.

Of course I am not a believer in continually whipping children for every little offense—corporal punishment should only be used when moral suasion fails—and never administered in anger, and it should always be sufficiently severe to make it remembered and dreaded. "Ida Gregory" seems to think because a child is whipped, it will learn to hate the one who corrects it. She certainly has had no experience in the matter. I know my four children have no such feeling—indeed, after the punishment is over, they recognize its justice, and know that it is only prompted by love and for their own good.

Hoping that other mothers who know the trials of governing children will give their experience,  
COLUMBUS, O. I am, etc.,

Mrs. Mary J. Anderson.

[We will be very glad to have the opinion of parents on this question. Theories, written by those who have had no experience, possess very little value.—Ed.]

---

"BRIDGET."

I never see this name which is so frequently and thoughtlessly used, but my blood warms with indignation in sympathy for the many honest working girls, who no doubt read the same, and certainly must feel the injustice of it. And the mothers of those girls; just think of the wound your thoughtless "by-word" must inflict, careless writer. Away back in the "cradle days" when the young mothers rocked and softly sang sweet lullabys to their infant daughters, the air castles that they built for them were innumerable, the number of times that they toppled over were countless, but just as often were they rebuilt and improved. The most difficult task of all was to find a name suitable for the one that should occupy this beautiful mansion. At last, one is chosen. How often she repeats it to herself, and each time the name sounds sweeter with the repetition. But a loving mother's imaginative mind is one thing and stern reality another. The years are ungenerous in their flight, they bring naught but disappointments. The mother has to exercise a great deal of self-sacrifice in order that her girl should receive a tolerable education, but the daughter, who is probably one of a large family, feels that she is a burden to her parents and willing to support herself. She seeks for employment in the domestic line, because her limited education bars her from a higher position though not a more honest one. Then to the ambitious, sensitive girl what an eye sore "Bridget" must be when it confronts her in print.

Again, compare the working with the non-working girl, one that will neither assist at home nor abroad, although in both cases, the circumstances are identical. As a rule the latter despises the former, while the former is eminently her superior in everything.

*Mrs. C. S. Miller.*

[We are glad to know you are so greatly pleased with the new MAGAZINE.—  
Ed.]

---

A DIFFERENT OPINION.

In the December number of the MAGAZINE, a respectful (?) brother of the Woman's Department, expresses his ideas on the subject, "Of What Does a True Wife Consist." He evidently has great contempt for a woman who dares to aspire to anything nearer man's sphere, than the ball room or picnic.

If the hours he has spent in company with really intelligent, business women, are as few as the hours he has spent in the study of the proper use of the letters contained in the alphabet, he had better devote a portion of his spare time to the study of the latter, and fit himself for the companionship of the former, and then possibly his views might be different. If he has a wife, or ever does have one, it is to be hoped he will regard cutting wood, building fires, carrying coal, etc., as work so much more becoming to man, as to strictly forbid her doing any of them.

His own selfishness assures him that a woman is not out of her sphere in the ball room, for what pleasure would there be there for him, without the presence of ladies. He, like many other men, has visions of cold victuals, poor, neglected husbands and children, as being the order of things if women take any interest in political affairs or have the privilege of voting, but I know from actual observance and experience that [such is not the case. I lived for four years in the state of Kansas, and voted with hundreds of true, intelligent, home-loving women, and have never yet known any of them to be any the less attractive in the home, or less careful in discharging their duties as true wives and mothers. And I know, too, the absurdity of the oft repeated protest, that the polls is no place for a lady from the fact that she is liable to insult from some of the rough men with whom she may come in contact. A lady can command the same respect at the polls as she commands at any other public place of meeting.

*Mrs. F. W. Wheeler.*

APRIL, 1893.

## FEDERATION.

This MAGAZINE has always advocated federation. Having seen it established, and observed the good effects resulting from its influences, we have also witnessed its decline and fall, but still adhering to the principle, we see it again coming to the front for the purpose of solving some of the troublesome questions which railroad employees are required to meet.

The following official circular fully explains itself, and requires at our hands, no elaborate discussion. System federation is now a fact, and all well wishers of the hardy men who run railroad trains, or are connected with the train service, will hope that every expectation will be fully realized.

THE GRAND LODGE OF THE  
BROTHERHOOD OF LOCOMOTIVE FIREMEN,  
OFFICIAL CIRCULAR, No. 6—1892-3.  
TERRE HAUTE, IND., February 10, 1893.

To Subordinate Lodges:

SIRS AND BROTHERS:—In addressing this circular to you, attention is invited to the fact that it relates exclusively to the subject of federation, which was brought before the delegates at the late convention.

That the fullest information may be had of the alliance to which the brotherhood, through its authorized representatives, has become a party, the following recommendation of the Grand Master to the delegates of the Third Biennial Convention at Cincinnati, O., in relation to the subject, and upon which all subsequent proceedings were based, is introduced:

### FEDERATION.

It is with feelings of regret that I inform you of the dissolution of the Supreme Council of the United Order of Railway Employees, which was the result of a resolution passed at the Atlanta convention four years ago. After nearly three years of successful work, in which railway organizations were brought into close relationship, and through federation exerted a powerful influence for good, on account of personal feelings and imprudent action on the part of members of the Council, ill-

feeling sprang up, treachery entered in and overthrew the Council, and finally there remained alone the Switchmen's Mutual Aid Association and the Brotherhood of Locomotive Firemen—and at the last annual meeting, held June 20th, 1892, it was deemed prudent on the part of the grand officers of both organizations to dissolve.

We are now in this position: The Supreme Council has passed away; the resolution passed at San Francisco adopting the Federation, as laid down in the laws of said Council, remain a statute upon the records of the order, and it is necessary that some action be taken on the part of the Grand Lodge, either to annul or maintain.

Federation, as mapped out in the laws of the Council, was effective so long as they were respected and men in council labored for the good of all, but when jealousy and treachery entered, its mission was completed. The Council has done its work. We did not labor for naught. Out of the experiences of the past will come a better, a more perfect federation, a federation of the rank and file who make up these brotherhoods. The men who are in the harness seek federation; they believe in it, and they will have it. Grand officers may quarrel with each other, and keep these organizations apart for awhile, but not forever—and the day is coming when you will see railway employees going hand in hand together under the banner of Federation. The Brotherhood of Locomotive Firemen, as an organization, is at peace with all. It is not in any manner responsible for the dissolution of the Council. We stand ready to aid our fellowmen. Therefore I recommend that the Brotherhood of Locomotive Firemen in this assembly declare in favor of federation, and authorize its grand officers to make such arrangements with other railway organizations as in their judgment will best promote the welfare of all; that until such time as a national federation is established, members shall not be allowed to enter into any agreement upon any system of railway under the guise of system federation, but when grievances arise of a general character they shall be allowed to cooperate with committees from other organizations, and in case of a failure to effect a settlement they shall be governed by the laws of the protective department, and in no instance engage in or sanction a strike, except when the same has been approved by the Grand Master and the Joint Protective Board. We want no Aransas Pass federation. General federation has been a success, as the records will show, but wherever system federation has stepped in, a defeat has been recorded. I believe in allowing our members to work in conjunction with the committees of other organizations, as we have with the engineers, but when they fail to effect a settlement, before extreme measures shall be resorted to let them call upon the grand officers, and let the laws of the protective department be brought into service. I believe that the time is not far distant when the organizations will all be in line again, under a general federation, and that you should empower your grand officers with authority to act when that time comes.

The recommendation of the Grand Master above referred to was exhaustively discussed, and it resulted in the appointment of a committee to take the matter under advisement, which committee reported as follows:

CINCINNATI, September 30, 1892.

To the Officers and Delegates of the Third Biennial Convention:

GENTLEMEN AND BROTHERS:—We, your committee appointed to present a plan of federation, respectfully submit the following:

We think that under present conditions it is impossible for this convention to formulate any system of general federation that can be inaugurated so as to be at once available for our protection, but would recommend that a federation committee, consisting of the Grand Master and two members, not grand officers, be elected by this convention to confer with the representatives of other organizations with a view to formulate some plan of federation of a general or national character, to be adopted by this order at some future time.

In the meantime we recommend the adoption of the following plan of federation by systems:

**SECTION 1.** Upon each system of railroads within the confines of North America the Joint Protective Board of the Brotherhood of Locomotive Firemen shall be authorized to federate and co-operate with the several joint boards of other organizations who have members employed on that system.

**SEC. 2.** In the event of any board failing to adjust a grievance, the Secretary shall forthwith prepare a full and complete statement thereof under seal and with the signatures of the board attached and forward the same to the chairman of the protective board of each organization constituting the federation.

**SEC. 3.** The chairman of any board receiving such notice and statement as provided in Section 2 from the chairman and secretary of any board participating in the federation, said chairman shall forthwith issue a call upon his board to meet at such time and place as may be designated in the call; and when so convened the several boards shall constitute and be known as the General Federated Board of that system, and shall, if they approve the grievance, use every honorable effort to adjust the same.

**SEC. 4.** In the event of the General Federated Board failing to adjust any grievance that may be referred to it, said General Board shall forthwith forward a complete statement to their respective chief executive officer, who shall at once repair to the scene of trouble and use such measures as in their judgment the situation may require.

In the event of it becoming necessary to adopt extreme measures the same shall be authorized by a two-thirds vote of the members of the Federated Board and in conjunction with the chief executive of each organization, provided that each shall have an equal representation on said board.

**SEC. 5.** Should a strike be inaugurated the chief executive of the organization aggrieved shall be the recognized leader and shall have power to declare the strike off by and with the consent of the General Federated Board, such consent to be determined by a two-thirds vote, as provided in Section 4.

**SEC. 6.** The expenses incurred in the settlement of any grievance shall be paid by each organization as they are now paid; and in case a strike is inaugurated all organizations participating shall draw upon the protective funds as provided in the protective department of their respective constitutions and by-laws.

Respectfully submitted, by  
G. W. GREENWOOD, Chairman No. 173.  
A. H. TUCKER, Secretary.  
C. A. WILSON, No. 13.  
JAMES CART.  
THOS. N. MODELAND, No. 67.  
Committee on Federation.

The above report of the committee is fully set forth on pages 377-378 of the *Journal of Proceedings*, and was also published in the November issue of the *MAGAZINE*. Supplementary to the foregoing action a committee of three, consisting of Grand Master Sargent, Bros. G. W. Greenwood and C. A. Wilson, was elected to confer with the representatives of other organizations of railroad employees for the purpose of making the Federation general in its character.

Pursuant to the foregoing action and in response to a call of Grand Chief E. E. Clark, of the Order of Railway Conductors, a meeting of the representatives of the various orders of railway employees was held at Cedar Rapids, Iowa, December 28, 1892, at which meeting were Grand Master Sargent and Bro. C. A. Wilson. Brother G. W. Greenwood was not present and failed to respond to messages urging his attendance.

CEDAR RAPIDS, IOWA, Dec. 31, 1892.

#### ARTICLES OF FEDERATION.

**SECTION 1.** On any system of Railroad, the General Grievance Committee and Boards of Adjustment may federate and co-operate with any of the following organizations:

Brotherhood of Locomotive Engineers, Brother-

hood of Locomotive Firemen, Brotherhood of Railroad Trainmen, Order of Railway Telegraphers, Switchmen's Mutual Aid Association, and Order of Railway Conductors, for the purpose of adjusting any grievance which may be represented in accordance with the laws of the organization aggrieved.

**SEC. 2.** In the event of any General Grievance Committee failing to adjust a grievance in accordance with the laws governing their organization, the Secretary of said committee shall forthwith prepare a full and complete statement thereof under seal and with the signatures of the committee attached and forward the same to the Chairman of the General Grievance Committee of each organization constituting the Federation.

**SEC. 3.** The Chairman of any General Grievance Committee receiving notice and statement as provided in Sec. 2, from the Chairman and Secretary of any General Grievance Committee representing any organization participating in the Federation, said General Chairman shall forthwith answer such call in person to meet at such time and place as is designated, and when so convened, the several General Chairmen shall constitute the General Federated Committee of that system and shall proceed to organize by the election of a Chairman and a Secretary, who shall serve until their successors are duly elected. After such organization they shall, if they approve the grievance, exert every honorable effort to adjust the same.

**SEC. 4.** In the event of the General Federated Committee failing to adjust any grievance that may be referred to it, the Chairman of the Committee having the grievance shall forthwith notify the chief executive officer of the organization presenting the grievance, who shall at once repair to the place of meeting and if, in his judgment, the grievance is of sufficient importance, and under the laws of his organization he is prepared to approve a strike, he shall immediately convene the Chief Executive of each organization represented in the Federation and in the event of it becoming necessary to inaugurate a strike the same shall be authorized only by a two-thirds vote of the Federated Committee, and the unanimous consent of the Chief Executives of all the organizations represented.

**SEC. 5.** Should a strike be inaugurated the Chief Executive of the organization aggrieved shall be the recognized leader and shall have power to declare the strike off with the consent of the General Federated Committee, together with the unanimous approval of the Chief Executives of the organizations embraced in the Federation as provided in Sec. 4.

**SEC. 6.** The expenses incurred in the settlement of any grievance (or in case of a strike) shall be paid by each organization in accordance with the provisions of their respective constitutions and by-laws.

**SEC. 7.** A copy of these articles, duly signed by the authorized representatives of each of the organizations represented in the federation on any system, shall be forwarded to the chief executive of each organization and receive his approval before becoming effective and no member of this organization shall engage in, or be a party to, any federation or alliance except as herein provided.

**SEC. 8.** Any organization that is a part of this federation failing to comply with the rules and regulations contained herein, shall not receive any support or recognition from any system upon which the violation occurs, but no organization will be deprived of the benefits of this federation by reason of the acts of its representatives, or its individual members, until such time as they have approved of the action by failure to discipline the parties at fault and then only after proper trial and conviction by a two-thirds vote of the Federated Board, subject to an appeal to the executives of the organizations, parties hereto.

**SEC. 9.** If a federation is formed on any system which does not include all the organizations herein named, the others shall be eligible to membership and may file application for such membership with the Secretary of the Federated Board. Upon receipt of such application, he will forward the same to the chairman of each general committee, party to the federation, who will in turn submit it to his

associates. Upon receipt of the vote of his associates, he shall file with the Secretary of the Federated Boards the vote of his organization in accordance therewith, and the organization applying for membership shall be admitted, if a majority of the organizations party to the federation vote in favor of such admission.

SEC. 10. These articles may be revised, altered or amended by unanimous consent of the executives of the organizations, parties hereto.

Approved: F. P. SARGENT,  
Grand Master, B. of L. F.  
C. A. WILSON.

Dec. 31, 1892.

Therefore your representatives have acted in the matter, by virtue of the power within them vested, and formed a Federated Alliance with other organizations of railroad employes, the plans adopted at the meeting above referred to and hereinbefore fully set forth is now declared to be in full force and effect in relation to the Brotherhood of Locomotive Firemen, and all subordinate lodges will govern themselves accordingly.

Yours fraternally,

F. P. SARGENT, G. M.,  
C. A. WILSON,  
Com. on Federation.

Attest: F. W. ARNOLD, G. S. and T.

Some of the organizations represented at the Cedar Rapids conference had to secure for their acts the approval of their organizations, and another meeting of the representatives of the several organizations was to have been held on March 9, but the occurrence of the Ann Arbor strike prevented the meeting on that date. Action, however, will be taken at an early day, and then system federation will be fairly on trial.

The *Age of Labor*, one of the very best publications on labor and kindred subjects, has removed its headquarters from Chicago to Oshkosh, Wis., 175 miles north of the "windy city." The form of the paper is changed, giving more space, and at an early date the publication will be issued weekly. Bro. Rogers, in his issue of March 1st, says:

The *Age of Labor* has experienced all the tempering things incident to removing a newspaper office from one city to another. As is usual in such cases there has been unexpected delays. The paper is now settled in its new home at Nos. 8 and 10 Otter street, and having hurriedly gotten out the first number the editors will give their attention to future improvements.

Among the new features to be introduced will be "labor philosophy sugar-coated, economic principles woven into the woof of romance." Not a bad idea. On the contrary, the new departure has much to recommend it, even to those who generally clamor for strong diet. The *Age of Labor* in its new home will, it is to be hoped, have a prosperous career.

We have on our table the *Railroad Trainmen's Journal* for March, an exceptionally meritorious number, its editorial department, in charge of Bro. D. L. Cease, coming squarely up to the demands of the times in the treatment of important questions in which labor has an abiding interest. Bro. Cease is giving his *Journal* an enviable reputation among the labor publications of the country.

## STRIKE ON THE TOLEDO, ANN ARBOR & NORTH MICHIGAN RAILWAY.

The strike of engineers and firemen on the Toledo, Ann Arbor & Northern Michigan Railway, which took effect at 6 o'clock A. M. Wednesday, March 8, 1893, in some of its aspects, stands unparalleled in the history of railroad strikes or any other class of strikes in America. This will be made to appear as we proceed.

In this strike, as in every other, there will be found a cause which investigation readily reaches and brings to the front for the contemplation of men who desire to form and express honest opinions. In this connection we have the following official statement:

This strike is inaugurated only after due and careful consideration of the questions involved, which are:

1st. A positive refusal on the part of the corporation to pay their enginemen a fair rate of wages, the pay the men were receiving being the *lowest* in the country.

2d. The demand on the part of the corporation that all firemen in its employ shall peremptorily leave, renounce, abandon and desert the brotherhood.

3d. For general outrageous treatment of the men employed on the said railway.

But underlying such official declarations, there existed another cause for the dissatisfaction of the men. About eighteen months ago, a schedule of wages was adopted, agreed to by the men and by the railroad officials, which was never lived up to for a day. Necessarily such unjust and disreputable conduct on the part of the railroad company bore its legitimate fruits of unrest, distrust, and righteous contempt of officials who, having the power, played upon their men the game of thrift and theft, until every consideration of manhood demanded redress though it forced them to inaugurate a strike, the last resort of wronged and oppressed men.

The President of the road is a man by the name of Ashley, James M. Ashley, who some time ago believed he had a call for a congressional career. While the spasm was upon him, he professed great regard for workingmen. At such times he spouted like a geyser and wept like a crocodile. He didn't go to congress in the interest of corporations, and this fact has probably intensified his hostility to workingmen. The General Manager of the road is a son of the President, and he has many characteristics of baseness which have made him specially odious. His whole make up is detestable, and his henchmen, those who do his bidding in the management, are expected to cultivate whatever is repulsive and obnoxious.

With such a President and General Manager, it requires no effort of the imagination

to comprehend the character of the henchmen who deem it wise to play the role of miscreant for their sustenance.

The men who struck on the 8th day of March, found it utterly impossible to honorably adjust their difficulties with father and son, who controlled the destinies of the Toledo, Ann Arbor & North Michigan Railroad. They exhausted diplomacy. Stubborn facts relating to wages, work and treatment, were all brushed aside with autocratic insolence, nor could the grand officials of the brotherhood involved make any impression upon the magnates. As a result, patience was exhausted, justice was denied, and as a consequence, a strike resulted.

Who ordered the strike? Reports would have the public understand that Messrs. Arthur and Sargent ordered it, and were responsible for it—that the men were "called out" regardless of their interests and wishes—and manifestly, the ermined judicial crank, who vaulted a la clown, in cap and spangles, into the ring to make law ridiculous, has got that vagary into his addled brain. It may be well, in this connection, to state for the edification of the general reader, that the grand officials of the brotherhoods involved in the strike cannot order a strike, and the question is forever settled by the declaration of Grand Master Sargent. In a recent interview he said in response to the question, "Did Mr. Arthur or yourself order the strike?"

No. We have no power to either order a strike or a boycott, and on this point I believe the judges are in error in bringing the charges against us. The laws of both organizations are very explicit in regard to strikes. No authority is given either to Mr. Arthur or myself to order a strike. A strike is called by the men employed on the road where the grievances exist. Each road has its grievance committee, which takes the matter before the officials for adjustment. If the committee fails the matter is submitted to Mr. Arthur by the engineers, or myself by the firemen. In case we fail to get a settlement, the matter passes out of our hands entirely, and goes back to the employees, who order a strike, providing two-thirds of the men declare that intention by vote. After that is required of the brotherhood after the strike is called, is financial support or a refund of the money paid in by the members, for protection in case of death, or by being thrown out of employment. Therefore the charges made against Mr. Arthur and myself for ordering a strike is without a foothold. We did not order a strike or boycott. The men quit work on their own free will, and not by our orders.

It will be seen at a glance that the men who struck acted absolutely independent of the grand master of this order. They did not act rashly, there was no undue haste, everything was orderly and according to the laws of the respective orders. They petitioned, then offered arguments based upon facts. Failing in these honorable efforts, the men called in the grand chiefs who are the avowed advocates of peace. When all efforts to bring about a just arrangement failed, the men, by a vote, declared a strike. It is proper in this con-

nection to state what has been publicly announced, that the Brotherhood of Locomotive Engineers has a law relating to boycotting railroads to the effect, that "no freight shall be handled to or from a road on which the engineers are on a strike." The Brotherhood of Locomotive Firemen have no such law, a fact which the astute judge did not know, a matter of no consequence, as courts are managed, and as a result on March 17, Judge William Taft, (it ought to be written Daft), issued the following pronouncement:

That the said defendants, P. M. Arthur and F. P. Sargent, and each of them, be and they are hereby enjoined and restrained from issuing, promulgating or continuing in force any rule or order of any kind under the rules and regulations of the association known as the Brotherhood of Locomotive Engineers or the rules or regulations of the association known as the Brotherhood of Locomotive Firemen, or otherwise, which shall require or command any employees of any of the defendant railway companies herein to refuse to receive, handle or deliver, or to be in any way instrumental in refusing to receive, handle or deliver any cars or freight in course of transportation from one state to another, from and to the Toledo, Ann Arbor & North Michigan Railroad Company, or from refusing to receive or handle cars of such freight which have been hauled over the railroad of said Toledo, Ann Arbor & North Michigan Railroad Company; and also from in any way, directly or indirectly, endeavoring to persuade or induce any employees of the railway companies whose lines connect with the railroad of said Toledo, Ann Arbor & North Michigan Railroad Company not to extend to said company the same facilities for interchange of interstate traffic as are extended by said companies to other railroad companies, and in case such rule or orders shall have been promulgated or issued by said Arthur and Sargent or either of them, prior to the service upon them of the restraining order herein, they and each of them are hereby required and commanded to recall and rescind such rule or order and to refrain from enforcing the same.

The folly of the order appears at once, when it is stated that the Firemen's Brotherhood has no boycotting law, hence the stupidity of restraining Grand Master Sargent and the imbecility of restraining Grand Chief Arthur is apparent since the order to boycott is a law of the Engineers' Brotherhood and requires no order from the Grand Chief to make it effective, hence the stupidity of the order enjoining Sargent and Arthur.

It appears there were two United States judges using the powers of the federal courts to down the strikers, sustain the corporations in their policy of injustice and play into the hands of scabs. These ermined worthies are Ricks and Taft, champions of corporations, who give judicial bench shows—when Towser is up Growler is down and vice versa; first to restrain Arthur and Sargent from doing what they had no authority to do, and second, to arrest men for contempt against whom no restraining order had been issued. It is exceedingly difficult to thread the labyrinthian tracks of these judges, who like sleuth-hounds are hunting down workmen, and who make laws as they go.

But a noticeable fact is, that in all of the orders of these two worthies, tangled as they are, there is one supreme purpose—to uphold the corporation which has money and free passes, and to trample down the men who have been robbed by the corporation. The terrible fact looms up and confronts organized labor, that there is no limit to the crushing power of a federal judge. His stronghold is the fact that he can issue any order his malice may suggest and if disobeyed, prisons yearn for those who are in contempt of the court, and they are exiled during the pleasure of the judicial malformation. Referring to the boycotting law of the Engineers' Brotherhood, Judge Taft issued an order in which P. M. Arthur, Grand Chief, is commanded: "In the manner customary and usual to the Brotherhood of Locomotive Engineers of giving information to its members, to cause to be known and published that the law, by-law, rule or regulation of said Brotherhood requiring its members to refuse to handle the cars of the Toledo, Ann Arbor and North Michigan is not in force or effect against the said railroad." That is to say, the law of the brotherhood is knocked out, and men are practically ordered by the court, as if they were so many slaves, to do things their law forbids their doing, and it appears that the right of men to resign their position as employees is denied. In the general jumble, it is held that the judge does not mean to deny men the right to quit work, but simply that engineers must not abandon their engines at way stations. This, however, is mere assumption and the remarks of General Manager Ashley show that he understands the judge to mean that employees are a part of the machinery of the road, a part of its rolling stock. He says: "I do not think that the orders of Judges Ricks and Taft can be construed into attacks upon the brotherhoods, as has been stated. They merely apply to the men as individuals and agents of the carriers. What are the carriers? Things of thin air without the men. The vital part of them all is the employees. Then if laws are made to govern the carriers, should not these men who are in fact the carriers be held responsible? If there is a delay to the move of freight to the detriment of business or a loss on account of the holding back of perishable freight, and such delays and loss arise from the actions of the men, then I should think that any fair-minded persons would say that they were the ones to be held. It is not a matter of brotherhoods, but a matter of justice."

Here we have it straight out from the shoulder that the men on a railroad train are "the carriers." If they quit, the carrying ceases; therefore, it is the province of

the court to command them to carry, and the general manager evidently had received his tip from the judges, since first to last, the judges have indicated their low estimate of railroad employees. Dismissing such reflections it may be said that at one time after the strike was inaugurated there were indications of a settlement. On March 16 Mr. William Kirkby, state railroad commissioner of Ohio, appeared at Toledo and set about arranging a settlement with James M. Ashley, president of the road, and it was earnestly hoped on the part of the strikers that the troubles would cease, and that an honorable settlement would be made. The *Toledo Blade* of March 16, contains the following in reference to the negotiations.

Arriving in Toledo, he (Kirkby) immediately closeted himself with Chief Arthur, of the engineers, and Grand Master Sargent, of the firemen. From them he gleaned the exact status of the situation, and then began sounding for a settlement of the difficulties. This he brought to a head Monday morning, when Governor Ashley and the two chiefs decided to agree upon a conclusion that Mr. Kirkby and Mr. Ashley might reach by conference. That conference began Monday afternoon at 2:30 o'clock and has continued for three days, the two men being together for several hours each day. Each item of the demands and grievances of the men was taken up separately and thoroughly discussed and argued before acting upon. In this manner a conclusion was reached at noon to-day, drawn up and signed by both peacemakers. It is as follows:

#### THE AGREEMENT.

To Geo. W. Taylor and J. D. Pollard, acting for the late employees of the operating department of the Toledo, Ann Arbor & North Michigan Railway Company.

Gentlemen: In the matter submitted by you to the undersigned, touching the hours of labor, and the compensation therefor, by the Toledo, Ann Arbor & North Michigan Railway Company.

First—I recommend that the Toledo, Ann Arbor & North Michigan Railway Company when employing men stipulate with each employee that it will not discharge him (except for cause) without giving each man 30 days' notice, and that each employee shall make a like stipulation not to quit the service of the company without giving 30 days' notice.

Second—I recommend the company pay its enginemen and firemen as follows:

#### RATES.

Passenger engineers, \$3.70 per 100 miles.  
 Passenger firemen 53 per cent. of engineers' pay.  
 On mogul and ten-wheel engines—  
 Freight engineers, \$3.40 per 100 miles.  
 Freight firemen, 53 per cent. of engineers' pay.  
 Ann Arbor and other switching engines—  
 Engineers \$2 per day.  
 Firemen, \$1.60 per day.  
 Engineers on Consolidated, \$3.70 per 100 miles.  
 Firemen on Consolidated, 53 per cent. of engineers' pay.

Overtime for all classes of trains and engines switching in yards after 14 hours:

Engineer, rate per hour, 30c.  
 Fireman, rate per hour, 10½c.  
 Engineer on snow plow, 40c. per mile.  
 Fireman on snow plow, 50 per cent. of engineers' pay.

Engineer on wreck train, \$3.50 per day.  
 Fireman on wreck train, 53 per cent. of engineers' pay.

Engineers on work and construction, \$3.25 per day, 12 hours; over pay after 14 hours.  
 Firemen, 53 per cent. of engineers' pay.  
 One hundred miles shall be allowed for all runs; over 100 miles actual mileage.

Third—It is my decision that the late employees of the operating department of the Toledo, Ann Arbor & North Michigan Railway Company who may desire to re-enter its service shall make application in writing to the superintendent of motive power at Owosso, Mich.; applications to be considered in the order received, and such applicants, when notified, shall be assigned to duty without prejudice.

Fourth—The oldest engineer or fireman in the service of the company shall have preference of runs on their respective divisions if competent and worthy.

Fifth—Engineers and firemen will not be discharged without a fair and impartial trial, with privilege of calling witnesses. Investigations to be made without unnecessary delay.

WILLIAM KIRKBY,

Commissioner of Railroads, Ohio.

I concur in the above finding and judgment of the Hon. William Kirkby, Railroad Commissioner, and the officers of the Ann Arbor Company will be directed to put the same in force.

JAMES M. ASHLEY,

President T., A. A. & N. M. Ry. Co.

The foregoing adjustment of the strike was rejected by the men, owing to article third, injected by Commissioner Kirkby, and in flagrant antagonism to the rights and interests of the men who demanded reinstatement, without prejudice, to their former positions, and which article third, as above given, denies them. In this connection a full explanation of the rejection of the proposed settlement should be given, as follows:

Grand Chief Arthur and Grand Master Sargent have furnished the following statement as to the reasons why the plan for settlement of the Ann Arbor strike, agreed upon between President Ashley and Wm. Kirkby, State Railroad Commissioner, was not accepted by the engineers and firemen:

"Mr. Kirkby gave us to understand after his first conference with Mr. Ashley that the engineers and firemen who went out on the strike would be restored to their former positions without prejudice; that he wanted his old men back again and that was settled, if we could agree upon the rate of wages. After submitting our proposition of wages, it was rejected by Mr. Ashley. Mr. Kirkby returning with the rates which Mr. Ashley was willing to grant, we took them up, discussed them and submitted as our ultimatum the present rates embodied in the agreement signed by Mr. Kirkby and President Ashley. On reading the document over we found that Mr. Kirkby, of his own volition, without consultation with Mr. Ashley, inserted an article reading as follows:

"3. It is my decision that the late employees of the operating department of the Toledo, Ann Arbor and Northern Michigan Railroad Company who may desire to re-enter its service shall make application in writing to the Superintendent of Motive Power, at Owosso, Mich., application to be considered in the order received, and such applicants, when notified, shall be assigned to duty without prejudice."

"This clause was contrary to the instructions we gave Mr. Kirkby, as it would place our men entirely at the mercy of the Master Mechanic, in whom Mr. Kirkby stated to us he had no confidence whatever, and intended to have him removed. We urged Mr. Kirkby, as he had inserted the foregoing of his own volition and without consultation with Mr. Ashley, to insert in lieu thereof the following:

"Article 3. It is my decision that the late employees of the operating department of the Ann Arbor and Northern Michigan Railroad Company who went out on strike shall be reinstated to their former positions without prejudice."

"In that case we would accept the agreement and

declare the strike off. He had another conference with Mr. Ashley and returned, informing us that Mr. Ashley would not make the change, after which the committee representing the engineers and firemen had a conference with President Ashley and son, the General Manager, at which they requested them to make the change and they would sign the agreement and end the strike. They declined to grant the request, informing the committee that the matter had been thoroughly discussed by Mr. Kirkby and themselves, which proved to us that Mr. Kirkby had misrepresented the case to us. All honorable efforts having failed to effect a settlement, nothing remained for us to do but to continue the strike. We are still ready and willing to leave that question in dispute to any three General Managers in Toledo and abide by the decision. We regret exceedingly the necessity of continuing the struggle, but in justice to the men we represent we could not do otherwise."

The purpose of the corporation was to punish men for striking in as righteous a cause as ever aroused manhood to seek for justice. To have won even a semblance of victory and then to submit to the infliction of any penalty for honorable endeavor was more than the men would submit to, and we say all honor to the stalwart engineers and firemen who preferred defeat to disgrace.

In conclusion, it may be said that the strike of which we have written begins a new page in the history of the struggle of workingmen to secure their rights. As novel writers say, "the plot thickens." We are not one of those who cry "wolf" when there is no wolf, but there is danger ahead. Men are arrested for refusing to work, and this man, Judge Ricks, who, it is suggested, rides around the country on free passes to do the bidding of railroad corporations, indicates the depth of the degradation of a federal judge. The Chicago *Evening Post*, referring to the action of Judge Ricks, remarks that the courts have hitherto sustained the contention that every railway servant had a right to quit work, provided only that he quit in peace and did not interfere with another workman desiring to take his place. In former strikes the railways have conceded thus much. But Judge Ricks' action sets up the theory that a servant may not abandon his employment, even in peace. \* \* \*

\* \* \* \* \* If a workman may not when he will depart in peace, can the employing company discharge him at will and without provocation? If Judge Ricks be sustained we are, it seems, to have a new law of master and servant wholly at variance with existing law and precedent. We shall, in a word, see the right of the state recognized to administer the affairs of the railways altogether, and also the affairs of all quasi-public corporations. In other words, this Cleveland judge has taken a step toward state control of the railways which is state socialism."

### THE FOSTER ENGINEERING COMPANY

We are under obligations to Mr. I. N. Baker, secretary and treasurer, for an illustrated catalogue of the Foster Engineering Company, Newark, N. J., for 1893. The catalogue is a handsome pamphlet of thirty-two pages, setting forth by text and illustrations, the many advantages of the various descriptions of valves manufactured by the company. We notice that "the United States government equips its cruisers and battle ships with the Foster valves, but the *MAGAZINE* is specially interested in the valves to which the catalogue calls attention. Says the catalogue: "Now that the deadly car stove must go, the Foster regulator has come, to insure safety and comfort by a uniform supply of steam to passenger and other trains. Prominent railroad and car-heating companies have introduced it and others are examining its merits with a view to doing so." It is also stated that, "Railroad companies are peculiarly interested in our device for preventing and lessening the perils of escaping steam from the sudden breaking of feed-water connections. Heretofore outside check valves have been applied on locomotive boilers. These should everywhere be discarded as inadequate and dangerous. They are powerless, not only, but sources of additional peril in case of rear-end collisions and other accidents that tear away all projections and allow the steam to escape and do its deadly work. Only inside valves are safe. Realizing this, we have introduced the McDowell Inside Safety-Check Valve. It exactly supplies the needed safeguard. Placed inside the boiler, it cannot be exposed to outside or rupture. It has proved its priceless abrasion value on more than one occasion, where it has either prevented or greatly mitigated the loss of life and property attendant on this class of disasters. No modern locomotive can be said to be complete without it. Its value is apparent without further comment. It is applicable to marine boilers and to general service, as well as to locomotives."

Such facts are well calculated to interest locomotive engineers and firemen, and prompt them to urge the introduction of the McDowell Safety-Check Valve.

It is most agreeable to the *MAGAZINE* to say that our friend, Mr. I. N. Baker, occupies the responsible position of secretary and treasurer of the company, a guarantee of efficiency in all matters connected with his duties. Mr. Baker was for many years the able secretary of Col. Robert G. Ingersoll, a position which only a man of commanding merit could occupy. In association with Col. Ingersoll, Mr. Baker evidently became a close student of intellectual safety valves, calculated to correct mistakes and prevent disasters in navigating

the seas of controversy, and in running the thought trains of the country and that he is now engaged in helping to save the lives of his fellowmen, whose vocation is one of ceaseless peril, speaks volumes for his head and his heart, and we wish him a career full of happiness and prosperity.

### THE READING'S COLLAPSE.

The Philadelphia & Reading railroad has again collapsed and gone into the hands of receivers. Under the management of Austin Corbin, the P. & R. rose to a sublime altitude of infamy. Corbin was the tallest railroad bunco steerer in the world, and when he had fried as much fat as possible from what was once the best paying railroad in the country, he retired to give place to A. A. McLeod, another wrecker. Corbin and McLeod have earned wide notoriety, not only as rascals, but as the relentless foes of organized labor. Both of these plunderers had the faculty of misleading those who trusted them and held out longer than would otherwise have been the misfortune of the stockholders by palming off upon them a mass of lies for facts, and as a result, when the overwhelming crash came, everybody was amazed.

In setting forth the reasons why the P. & R. should go into the hands of receivers, statements are published showing the utter demoralization of the business, and then the following statement is published:

The result of this will be harm and inconvenience to the public as well as serious inconvenience and damage to the railroads, canals, mines and property, by reason of the failure to run and operate the same. The property of the railroad company is encumbered by mortgages or deeds of trust, securing various issues of bonds representing its funded debt. The so-called floating indebtedness of the company is also very large. The company is also indebted for taxes, for balances due the other railroad companies in the adjustment and interchange of business, for arrears of wages and salaries due its employees, and for the large sums due for materials and supplies. The property of the coal and iron company is also heavily encumbered by a great variety of mortgages, securing bonds and issues of bonds, and the company is also largely indebted for materials and supplies, and wages and salaries due its employees are unpaid to a very large amount. These companies are utterly unable, out of assets now available, to discharge or to provide for the indebtedness, and there is imminent danger of its property being levied upon, attached, sold and disintegrated, to the irreparable injury of its creditors.

The fellow, McLeod, having wrecked the property, rendering it unable to pay its debts, or even its employees, has been made, by a Philadelphia Judge, one of the receivers, and thus the comedy of errors and rascality proceeds. Men of sense must be impressed with the fact that pig-headed nincompoops who make war upon organized labor, are utterly disqualified for managing railroad property. They are the non-descript creatures whose hearts and kidneys have changed places and functions.

## EDWARD A. MOSELEY.

The law passed by the late congress relating to safety appliances on railroad trains, marks an epoch in legislations of great significance. It demonstrates that the law making power of the country does take some interest in human life. If corporations are without souls, as is generally believed, it does not follow, fortunately, that Congress is equally destitute in that regard, and cannot be aroused to a sense of obligation to do right.

It requires time and patience, however, to educate an average Congress. It is a great body and moves slowly. To convince it, and then instill into it the required courage to act, is a herculean task. Only the few are able to comprehend the conflicting influences brought to bear upon Congress when any important measure demands action, and, especially is this true, when the measure, in any sense, antagonizes the greed of corporations. In such cases capital and brains are in alliance, and if the measure provides protection for workingmen the tremendous disparity of influences is seen at once.

To enact a law "to promote the safety of employes upon railroads" brought out the full force of corporation opposition, and to succeed, labor was challenged to put forth every power at its command, and in the trial it found in the person of Mr. Edward A. Moseley, a champion whose steadfast fidelity is worthy of the highest commendation.

In the *Boston Daily Globe*, of March 2nd, we find the following editorial notice of Mr. Moseley's work on securing the passage of what is known as the "Safety Appliance" bill. The *Globe* says:

"The most interesting legislation which the sitting Congress has enacted is the bill compelling the use of safety brake and coupling appliances on all railways engaged in inter-state commerce.

"Thousands of petitions for the enactment of this bill have poured in upon Congress in the course of the last four or five years. The General Court of Massachusetts has thrice memorialized the Federal legislation in behalf of the measure. National conventions of state railway commissioners have called for action. President Harrison has urged the matter in three if not in all four of his annual messages.

"But even such an impressive array of supporters would not be sufficient to chain the attention of Congress to the subject, and supply the necessary motive power for the passage of a bill through the two houses in the teeth of a strong opposition on the floor and in the lobby. Behind every successful piece of legislation there inevitably is some one man of tireless energy and tactful enthusiasm.

"In this case the man is, we are glad to note, a citizen of Massachusetts, Mr. Edward A. Moseley, who, as secretary of the inter-state commerce commission, as well as secretary of the national body of state railway commissioners, threw himself with all his heart, into the contest for the safety appliance bill years ago, took the initiative in gathering and presenting the statistics that aroused the President and Congress to the need of some legislative provision against the great slaughter of train and switch employes, and built up and directed the organization that has at last commanded success.

"It is to be hoped that the new law may prove to be worthy of Mr. Moseley's unselfish labors and that he may find abundant reward in the protection of life and limb which the act was designed to give to the thousands of workingmen that pursue a far more hazardous calling than do those who go down to the sea in ships.

We have on our table documentary evidence of Mr. Moseley's untiring labors, as also the opposition that had to be overcome to secure the passage of the important measure, all indicating his comprehension of the situation and displaying, not only unflagging fidelity to the welfare of labor, but diplomatic skill of the first order in dealing with law makers. We are made acquainted with the vote of each member of Congress, as also his locality and party affiliations, for future reference, in all of which we see Mr. Moseley's splendid management.

It affords the *MAGAZINE* unstinted satisfaction to give Mr. Moseley the fullest possible recognition for his labors and sacrifices, and to pledge him that his work will not be forgotten. It is also most gratifying to the *MAGAZINE* to give prominence to the untiring interest taken in the safety appliance measure by the Hon. L. S. Coffin, a gentleman whose four score years in no regard impair his mental faculties, but who, almost as alert as when many years younger, gave the wealth of his knowledge, experience and influence in the interest of railroad employes. Educating influences are abroad in the land and labor has much to hope for in the future.

The *March Railway Conductor* has an editorial article on "Coupler legislation," in which we find the following:

As to the legislation itself, we do not believe it will be of much direct benefit so far as couplers are concerned, although we shall be very glad to be convinced that we are mistaken. It will be a benefit in regard to power brakes and the simple fact that a step has been taken will be of powerful influence in behalf of such additional legislation as experience may demonstrate to be necessary. The bill was not at all what railway employes wished or what they believe should have been enacted, but recognizing the utter impossibility of procuring anything else, they were practically unanimous in wishing the passage of the pending bill, which has undoubtedly been signed by the president before this time.

Railroad employes are organizing all over the country along industrial lines. To some extent they have organized along financial lines. Among these latter institutions is The Railway Building & Loan Association of Minneapolis, Minn. It was organized several years ago by a number of well known railroad men, primarily for railroad men. It combines the best features of a savings bank, trust company and building and loan association. The association furnishes a safe depository for the savings of railroad men, and also furnishes them opportunities for borrowing money for building homes, or other objects. It operates throughout the country, is under the supervision of the banking department, and its officers are efficient and conservative men. The systematic setting apart a portion of one's monthly income, is a very commendable practice. We recommend The Railway Building & Loan Association to the Brotherhood.

## A SONG OF WARNING.

"It is the intention of the management of rail-ways to crush the various brotherhoods, so as to be in shape to handle the immense traffic of the World's Fair."

That isn't any news at all,  
For many years we've known it;  
In vengeance they would on us fall  
To crush and ne'er condone it.

These days of trusts and combines great  
Are full of dire disaster  
For those who are compelled by fate  
To bow before a master.

Great wealth and power centralized,  
Cause autocratic fury,  
In rampant manner undisguised,  
Defying judge and jury.

Black chattels underneath the flag  
Have been emancipated;  
And white ones now the shackles drag,  
By whips excoriated.

This nation's running on apace  
To ruin, for the classes  
Claim every right to win life's race,  
And handicap the masses.

Appeals for mercy's sake to stay  
Such headlong persecution,  
I fear would but invite the fray  
Meant for our dissolution.

A craven attitude can ne'er  
Succeed when bullets rattle;  
But every man to do and dare,  
Will surely win the battle.

We want to live in peace with those  
For whom we toil, contented,  
They'll make us friends instead of foes,  
If tyranny's relented.

We'll never take advantage of  
A busy situation,  
Because the starry flag we love,  
Which typifies this nation.

But if the fight is on us forced,  
Which means our whole existence,  
Then chaos comes, for love's divorced  
When struggling for subsistence.

Stand, sentries, on our ramparts true,  
And do not fail to tell us,  
When first you spy the foe in view  
To crush us in his malice.

Then let our drums and trumpets bray  
The call for each defender;  
With God and right, we'll win the day,  
Our motto: "No Surrender."

SHANDY MAGUIRE.

The *Switchmen's Journal*, for March, referring to congressional legislation on car couplers, says:

The bill is by no means perfect, and perhaps is not all that railroad men desire, but it is a first step on the road which will lead to the general introduction of safety appliances and to measures, in a general way, for the protection of life and limb among those men who are engaged in what is to-day perhaps the most hazardous of all occupations, and for whose safety practically no provision has ever been made. As time goes on experience will indicate the proper means to be taken in order to enforce better protection. A beginning had to be made at some time, and the sooner the better for the safety of those engaged in this perilous occupation.

Yes, a beginning has been made, and as revolutions never take a backward step it is reasonable to assume that legislation in the interest of human life will go steadily forward.

## ROBINSON MONUMENT FUND.

The following subscriptions to the Robinson Monument Fund have been received since our last report:

A. M. Holmes, B. L. F., Monon, Ind.	\$ 1 00
Wm. Whitted, brakeman, Bedford, Ind.	25
David Engler, O. R. T., Monon, Ind.	1 00

The *Railway Employees' Journal*, published at Albuquerque, is the official organ of the Brotherhood of Railway Employees, a new order recently launched for the purpose of promoting the welfare of railway employees. In his salutatory, Editor F. W. Phelan says:

The Brotherhood of Railway Employees advocates the doctrine, "in unity there is strength." They believe under the fold of a common flag those employed in the engine, train and telegraph service, can best secure fraternal protection. Hence this journal will consider it its duty, and one we shall faithfully perform, to encourage all those engaged in the transportation department to become one of us, that they may secure the benefits to be derived from a protective organization founded upon laws and rules broad and comprehensive.

The MAGAZINE expresses the kindest wishes for the new order.

## GRAND LODGE.

## QUARTERLY DUES NOTICE.

OFFICE OF THE GRAND LODGE, B. OF L. F. (TERRE HAUTE, IND., April 1, 1893.)

*To Members of Subordinate Lodges:*

SIRS AND BROTHERS:—Pursuant to Section 129 of the Constitution, you are hereby notified that the dues for the quarter ending July 31, 1893, (such an amount as may be determined by the several lodges, provided in no case it shall be less than five (\$5.00) dollars,) are now payable, and must be paid to the Collector of your lodge on or before May 1, 1893. This amount will be in full payment of all subordinate dues and beneficiary assessments levied by the Grand Lodge for said quarter, as provided in Section 132 of the Constitution. All beneficiary members now enrolled and all those admitted prior to June 1, 1893, are liable for the full amount of quarterly dues for said quarter. All members initiated during the months of June and July are exempt from payment of quarterly dues for said quarter, as provided in Section 129 of the Constitution. Any member failing to make payment as above provided will be expelled from the order, as per Section 130 of the Constitution, said expulsion taking effect May 2, 1893, and the Secretary is required to make due report thereof to the Grand Lodge.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. and T.

## NOTICE TO RECEIVERS.

OFFICE OF THE GRAND LODGE, B. OF L. F. (TERRE HAUTE, IND., April 1, 1893.)

*To Receivers of Subordinate Lodges:*

SIRS AND BROTHERS:—You are hereby notified, as provided in Section 54 of the Constitution, that no beneficiary assessment is required for the month of April, 1893, and that therefore none has been levied for said month.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. and T.

## REDUCED TO \$1.00.

We have on hand a supply of bound volumes of the MAGAZINE for the year 1891.

The volumes are artistically bound in a way to withstand wear, and we need not say are intrinsically valuable, containing as they do, a wide range of topics on subjects well calculated to interest the general reader, as well as those who are the students of labor problems.

In this connection we suggest that these bound volumes of the MAGAZINE would be a valuable present on birth day occasions, or as tokens of remembrance, to be presented at any time, and as the price has been reduced to \$1.00 we shall hope to receive sufficient orders to reduce the supply, since no fireman's library would be complete without one.

By addressing LOCOMOTIVE FIREMEN'S MAGAZINE, Terre Haute, Indiana, orders will be promptly filled. Cash must accompany each order.

## NOTICE TO SECRETARIES.

OFFICE OF THE GRAND LODGE, B. OF L. F. (TERRE HAUTE, IND., April 1, 1893.)

*To Secretaries of Subordinate Lodges:*

SIRS AND BROTHERS:—Pursuant to Section 130 of the Constitution, you are required to report to the Grand Lodge as expelled all members who fail to make payment of their quarterly dues for the quarter ending July 31, 1893. The names of said member must be reported to you by the Collector of your lodge not later than May 2d, and by you reported to the Grand Lodge, in the prescribed form, immediately thereafter. Failing to report the names of expelled members as herein provided, the Grand Lodge will hold subordinate lodges liable for their assessments, as per Section 53 of the Constitution.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. and T.

## ADDRESSES WANTED.

L. H. McDANIEL.—Any one knowing his whereabouts will please correspond with Thos. Harris, 76 Bedford ave., Pittsburg, Pa.

ARTHUR W. CARTER.—Was at one time employed on the L. N. A. & C. Ry. Any one knowing his whereabouts will please correspond with Wm. Carter, Orleans, Ind.

FRED. DAUPHIN.—Formerly a member of Santa Rosa Lodge, No. 308; when last heard from he was living on the G. N. R. R. Any one knowing his whereabouts will please correspond with his sister, Laura Dauphin, East Carondelet, Ill.

## JENNESS MILLER ILLUSTRATED MONTHLY FOR APRIL.

The April issue of Jenness Miller Illustrated Monthly offers a fine feast of good reading. Mrs. Miller discusses many interesting topics in her department. There are some good stories, poems, fashion news and gossip, finely illustrated, and also the story of a wonderful Hindu woman. There is plenty of good reading on all topics of the day, and many fine illustrations. Published at 927 Broadway, New York. Subscription price, \$1.00 a year. Jenness Miller Co., 927 Broadway, New York City.

## BENEFICIARY STATEMENT.

OFFICE OF GRAND SECRETARY AND TREASURER,  
TERRE HAUTE, IND., March 1, 1893.

## To Subordinate Lodges:

SIRS AND BROTHERS:—The following is a statement of the Beneficiary Fund for the month of February, 1893:

## RECEIPTS.

Lodge No.	Amount.	Lodge No.	Amount.	Lodge No.	Amount.	Lodge No.	Amount.	Lodge No.	Amount.

F. W. ARNOLD.

## INDEMNITY BONDS.

On our advertising pages will be found a new advertisement from the Fraternal Societies Co-Operative Indemnity Union, which is calculated to call attention to their facilities for furnishing bonds at a nominal fee. This union has been doing a large business in bonding the local division officers of the O. R. T. and the endorsement of S. O. Fox, G. S. and T. is appended to their advertisement. Under the plan usually prevailing in fraternal orders, that of furnishing "Friendship Bonds," those whose signatures are obtained thereto (a small minority of the membership of the organization) assume all the responsibility, which responsibility through membership in the "Indemnity Union" is reduced to the nominal cost of such membership and borne pro rata by the entire membership. Their method of conducting work is identical with the plan of all fraternal societies and hence, in reality, they are "one of us." The expense is within the reach of each and every lodge.

Ivers & Pond Co., of Boston, advise us they are selling many Brotherhood men their pianos, and because of this success they have renewed their advertisement for another year. Their new advertisement this month contains a testimonial from Brother E. W. Crane, of Division 172, B. of L. E. which is indeed a very strong endorsement. They send their catalogue free. They are reliable and worthy of success.

The proprietors of the Carlisle Steel Works, Sheffield, Wilson, Hawksworth, Ellison & Co., attest "remarkable healing virtues" to Pond's Extract for Cuts, Bleeding, Wounds, Burns, Bruises, Sprains, Lameness, etc., arising from accidents occurring in their works, and state that "during the last 12 years, we have constantly kept the Extract in readiness: our workmen resort to it with perfect confidence."

Our old advertisers, S. H. Moore & Co., publishers of *Ladies World*, come out in this issue with their annual premium offer. It will pay our readers to note what they offer, as we have always found this firm fair and square in their dealings, and give just what they promise.

### RAILROAD SAFETY APPLIANCES.

---

When the congress of the United States deliberates for days and weeks upon any measure, it will be universally conceded that a principle is involved of vital consequence to the people. It will not be forgotten that it required about twelve years to place the interstate commerce law upon the statute books of the nation, nor will it be forgotten that the progress of the measure was fought by the railroads of the country at every step until the rights of the people triumphed.

It would be interesting reading now to bring into prominence the declarations then made, showing, if the interstate commerce bill passed and became a law of the land, what dire calamities would result, and similiar declarations were made, provided congress should enact a law compelling railroads to equip their locomotives and trains with appliances designed to reduce to the minimum accidents involving the death and maiming of employes and travelers.

This article is written for the purpose of informing the readers of the MAGAZINE of the drift of the discussion in the United States senate on the bill introduced by Senator Cullom, of Illinois, and which passed the senate as follows :

*Be it enacted, etc., That from and after the 1st day of January, 1898, it shall be unlawful for any common carrier engaged in interstate commerce by railroad to use on its line any locomotive engine in moving interstate traffic not equipped with a power driving-wheel brake and appliances for operating the*

train-brake system, or to run any train in such traffic after said date that has not a sufficient number of cars in it so equipped with power or train brakes that the engineer on the locomotive drawing such train can control its speed without requiring brakemen to use the common hand brake for that purpose.

SEC. 2. That on and after the 1st day of January, 1898, it shall be unlawful for any such common carrier to haul or permit to be hauled or used on its line any car used in moving interstate traffic not equipped with couplers coupling automatically by impact, and which can be uncoupled without the necessity of men going between the ends of the cars.

SEC. 3. That when any person, firm, company, or corporation engaged in interstate commerce by railroad shall have equipped a sufficient number of its cars so as to comply with the provisions of section 1 of this act, it may lawfully refuse to receive from connecting lines of roads or shippers any cars not equipped sufficiently, in accordance with the first section of this act, with such power or train brakes as will work and readily interchange with the brakes in use on its own cars, as required by this act.

SEC. 4. That from and after the 1st day of July, 1895, until otherwise ordered by the interstate commerce commission, it shall be unlawful for any railroad company to use any car in interstate commerce that is not provided with secure grab irons or handholds in the ends and sides of each car for greater security to men in coupling and uncoupling cars.

SEC. 5. That within ninety days from the passage of this act the American railway association is authorized hereby to designate to the interstate commerce commission the standard height of drawbars for freight cars measured perpendicular from the level of the tops of the rails to the center of the drawbars, for each of the several gauges of railroads in use in the United States, and shall fix a maximum variation from such standard height to be allowed between the drawbars of empty and loaded cars. Upon their determination being certified to the interstate commerce commission, said commission shall at once give notice of the standard fixed upon to all common carriers, owners, or lessees engaged in interstate commerce in the United States by such means as the commission may deem proper. But should said association fail to determine a standard as above provided, it shall be the duty of the interstate commerce commission to do so, before July 1, 1894, and immediately to give notice thereof as aforesaid. And after July 1, 1895, no cars, either loaded or unloaded, shall be used in interstate traffic which do not comply with the standard above provided for; and, in order to enable the said commission to perform the duties imposed upon them by this act, there is hereby appropriated, out of any money in the treasury not otherwise appropriated, the sum of \$3,000, or so much thereof as may be necessary.

SEC. 6. That any such common carrier using any locomotive engine, running any train, or hauling or permitting to be hauled or used on its line any car in violation of any of the provisions of this act, shall be liable to a penalty of \$100 for each and every such violation, to be recovered in a suit or suits to be brought by the United States district attorney in the district court of the United States having jurisdiction in the locality where such violation shall have been committed, and it shall be the duty of such district attorney to bring such

**suits upon duly verified information being lodged with him of such violation having occurred. And it shall also be the duty of the interstate commerce commission to lodge with the proper district attorneys information of any such violations as may come to its knowledge: Provided, that nothing in this act contained shall apply to trains composed of four-wheel cars or to locomotives used in hauling such trains.**

**SEC. 7.** That the interstate commerce commission may from time to time upon full hearing and for good cause extend the period within which any common carrier shall comply with the provisions of this act.

**SEC. 8.** That any employe of any such common carrier who may be injured by any locomotive, car, or train in use contrary to the provisions of this act shall not be deemed thereby to have assumed the risk thereby occasioned, although continuing in the employment of such carrier after the unlawful use of such locomotive, car, or train had been brought to his knowledge.

Numerous amendments were introduced during the progress of the debate, most of which were voted down, and some of which were accepted, but the main features of the bill were retained. It is not, however, our purpose to follow the discussion in detail, but rather to inform the readers of the MAGAZINE of certain salient features of the debates.

In the course of the debate, it was stated that there are now in operation in the United States 1,100,000 freight cars, and that to equip these cars with safety appliances, would cost the railroads from \$50,-000,000 to \$100,000,000—say \$75,000,000.

Referring to killing and maiming of employes, Senator Cullom said:

One purpose of the bill is to get rid of the necessity for the men to go on the tops of cars and to run from one to another, as well as to provide against the necessity of the switchmen going in between the cars to couple and uncouple. Here are some statistics on the subject of falling from trains and engines.

In 1891 the number killed was 598; in 1890 the number was 561; in 1889 the number was 493. In 1891 the number of injured was 3,191; in 1890 the number injured was 2,363; and in 1889 the number was 2,011.

It will thus be seen that, first by coupling and uncoupling cars, secondly by falling from trains, and then generally as to those engaged in operating railroads, the total for the four years, according to the statistics I have here, was 9,153 persons killed and 88,712 injured.

I assume that these statistics are correct, because they were furnished me by a statistician. With that table of facts before the senate it does seem to me that if we have any regard for human life we ought to do something that will hasten the time when this tremendous slaughter shall cease, if we can do anything to bring about that situation.

During the course of the debate, an amendment to the bill was proposed, which, if adopted, would have saddled the expense of supply-

ing the safety appliances, automatic couplers, air brakes, etc., upon the government, instead of upon the railroads, as follows :

That if the brake or coupling or device of any kind that shall be at any time adopted under the provisions of this act is under the protection of letters patent, it shall be the duty of the attorney-general to institute judicial proceedings in the supreme court of the District of Columbia to condemn such device, brake, or coupling, and the letters patent protecting the same, to the public use, upon just compensation to be paid by the United States to the owners of such letters patent.

The amendment was introduced by Senator Morgan, the argument being that a large number of railroads were too poor to purchase the safety appliances; besides, if they did purchase them, they would advance the price of transportation to an extent that would enable them to recoup the expenditure out of the pockets of the people; hence, it were better for the government to take possession of the patent coupler selected and pay its owner out of the United States treasury. Senator Palmer, of Illinois, was prompt in opposing this scheme of supplying safety appliances for railroad trains out of the United States treasury. Senator Palmer did not hesitate to declare the right of congress to regulate railroads, but the right to regulate does not include the right to subsidize railroads. Senator Palmer takes no stock in the cry that because the use of safety appliances would be expensive, railroads should be permitted to continue the use of old devices and let the work of slaughter go forward. "It would have been complained no doubt at one time that it would be excessively burdensome to require the railway companies to use the steel rail, and yet the greater economy and safety and all the other considerations that suggested the necessity for the steel rail overcome all objections, and the courts have since recognized the principle that these corporations must use the best devices, the best methods to insure public safety." Senator Palmer took occasion to put upon record some exceedingly wholesome reflections relating to railroad employees. Referring to the position of Senator Wolcott, who said that employes entered the service of railroads knowing the risks they were taking, and were paid for the risks, Senator Palmer replied, if the rule is fair, economy would suggest that as risks are diminished, the expenses would be less, since the element of danger would cease to be an element in the compensation and economy would suggest to the railroads the adoption of improved couplers. But, said the senator:

There is an aspect of cruelty and of wrong in that view. When you tell me that the men who have been trained for years in the service of the railway companies, until they have become familiar with that business, have acquired habits adapted to it, have bought homes where they can live convenient to the discharge of this duty, may decline such risks and have some discretion, I say it is certainly a purely imaginary discretion. These men have their employment, their business. They are trained to it, and as they become fitted for pursuits of this kind they become less fitted for other pursuits. They have become a distinct class of employes, and to invite them to go into some other business as a means of escaping these hazards is as cruel as it is impolitic. Their skill and experience become a part of the property of the country. They are trained men, familiar with these duties. Their experience, their education, contribute to the safety of persons and property; and as they are thus trained and have become efficient and skillful, it is the policy of the government to continue them in the employment they have selected, and it is the duty of the government to render that employment as little hazardous as possible.

The foregoing views relating to railroad employes are eminently just and it is gratifying to know that they had weight in the United States senate, the most august deliberative body in the world.

When railroads set up their poverty as a reason why they should not be required to equip their trains with safety appliances, it is well to note what United States senators say upon the subject. Speaking of strong roads and weak roads, Senator Palmer said:

My observation is that there is no such thing as a weak railroad in this country. There may be short lines, and there are some which have been improvidently constructed, and which, standing by themselves, have not been profitable to their owners; but the extent of my information is that the weak roads of the country are those that have been plundered by their managers. The road itself has the capacity of earning all that is necessary to keep the equipment in perfect order. There is no trouble about the earning capacity of a road, as I understand it, but the difficulty is, in most cases, that the earnings have taken a direction not in harmony with the interests of the public or those who are in the service of the corporation. I have in my mind now railroad property which is earning, which must and will earn money, but which has been enormously and wrongfully involved in debt, and by the efforts of those who hold the debts and control the property, at the same time the road is milked of its earnings, until its track is in poor condition, its running stock has become shabby, poor, and unsafe. Why? Not because of any inherent defect in the capacity of the road, but because of the shocking mismanagement of those who control it.

In the foregoing we have a fact stated on the floor of the senate that what are called the "weak roads," are those which have been plundered by the very men who oppose the use of safety appliances to save life and limb. After plundering their roads, after "milking" them of their vitality and reducing them to poverty, the men who

have profited by this scandalous business, plead poverty as an excuse for continuing the slaughter and the maiming of employes. Said Senator Palmer :

What is the duty demanded by the particular section of this bill to which I am referring? That a particular appliance shall be adopted which will materially diminish the hazards, and as a consequence of the result of its operation there will be a much smaller number of "accidents." Human life and human limb are the things to be saved. This is the question of public duty that devolves upon the representatives of the states and the people. Shall this thing go on when obedience to this requirement will save many lives? Shall these persons be excused, and have what may fairly be termed a license to kill, because they are too poor to conduct their business in a safe manner? Are we to protect them on account of that alleged poverty when the truth is that human life is more precious than the business of any given railroad? A short time ago in our sister republic, Chile, a mob destroyed the life of a man belonging to a man-of-war. At once our fleets were in motion, the drum-beat was heard, the military spirit of the country was aroused. Why? Because an American citizen had been unlawfully killed in Chile. But here we calmly sit by with the knowledge that many American citizens will be killed for want of this judicious precaution, and we say: "No; you may kill because you are poor; you have not the means of avoiding the destruction of human life." We argue the question as if it could be disposed of in this way: "You can go on with these unsafe appliances which you know and we know will kill men during the course of the year; you may do that. Why? Because you are not able to buy safer appliances; you have the license to kill on account of your poverty." Better tear up the railroads than that they should be operated to the destruction of human life.

It was stated during the debates that there are three thousand patents on car couplers in the United States, and that in so many, it would be difficult to select the best, the one car coupler superior to the remaining two thousand nine hundred and ninety-nine, and hence it was suggested that it was better to make no choice or permit the railroads to make their own selection, tantamount to having no legislation at all upon the subject. Senator Hawley, of Connecticut, having listened to all the arguments against the bill to compel railroad managers to supply safety appliances, affirmed that it was the duty of the government to interfere. He said:

I have known cases in my observation of the history of railroads where at short intervals there were injuries occurring, and the railroads protested in one case in my own state against being ordered to make certain improvements in the cars, so that the passengers could not slip between them. The railroad companies said that they could take care of their people, but they did not do it.

I think they are mistaken in this as a matter of economy. Look at this great big battle that went on in 1891. There were 28,800 people killed and wounded.

# COMPOUND LOCOMOTIVES.

## A GREAT BOOK

For Engineers and Firemen,

By ARTHUR T. WOODS.

FULL OF DIAGRAMS, ILLUSTRATIONS AND TABLES,

Should be Read by Every Progressive Engineman.

**PRICE, \$2.00**

### SYNOPSIS OF CONTENTS.

Theory of two-cylinder locomotives—Ratio of cylinders—Theoretical and actual indicator card—Principles of design—Description of Mallet, Von Borries, Worsdell and Lindner engines—Starting valves—Valve gear—Rules for size of cylinders—Starting power, with various forms of starting and intercepting valves—Economy contained in practice—Tabular statement of results of tests—Three-cylinder compounds in theory and practice—Illustrations—Distribution of work among cylinders—Starting power—Four cylinder compounds, tandem and with receivers—Illustrations and dimensions—Rules for proportions—Advantages and disadvantages of the various forms of compounds—American patents—Description of compounds built in the United States.

## BROKE DOWN. WHAT SHALL I DO?

This splendid book has been revised and improved and no engineer or fireman can afford to be without it. Two very fine and costly engravings of the Westinghouse Automatic and Air Brake Gear have been introduced, one of which is 9 by 34 inches, showing on one sheet the whole brake arrangement from the pump on the engine to the rear end of a passenger car. The new QUICK-ACTING TRIPLE VALVE, and the NEW ENGINEER'S BRAKE VALVE are shown also, and very clear explanations of the operations of all parts as well as the manner of handling them are given. A diagram of SLIDE VALVE MOVEMENT, 16½ by 18½ inches, accompanies each book, the explanation of which is made so clear that any person can understand it. It shows EVERY PART OF VALVE MOTION, from the eccentric to the steam chest, as well as the manner in which steam is admitted to and discharged from the ports in the cylinder. It shows the piston also and everything connected with it. There are also three large engravings of engines, making five in all, in a pocket in each book. The whole work without doubt contains MORE VALUABLE INFORMATION IN FEWER WORDS, and is easier understood by railroad men, than any other book now in print, because it is written in the same manner that railroad men talk to each other, and by one who has had FORTY-TWO YEARS' PRACTICAL EXPERIENCE. REMEDIES FOR BREAK DOWNS AND FAILURES OF EVERY KIND that are likely to occur on the road, are given in language familiar to every engineer or old fireman, also the BEST PRACTICES FOR RUNNING. A study of this book has qualified many FIREMEN FOR PROMOTION. Their letters say in substance, "I would not have been promoted without it." or, "It put me on the right side." The book is very valuable to MEN WORKING ON REPAIRS OF ENGINES, and is a gold mine to locomotive FIREMEN AIMING AT PROMOTION.

Every CONDUCTOR and BRAKEMAN as well as ENGINEERS and FIREMEN should become acquainted with the workings of the Air Brakes now in use. ONE HOUR careful study of the description of the operations of the WESTINGHOUSE AUTOMATIC and AIR BRAKE will qualify ANY INTERESTED PERSON for examination on that subject.

Price of READY REFERENCE, postage prepaid, \$1.50 per copy, or \$15.00 per dozen.

That would be a heavy loss for an army of 200,000 men engaged in battle, only, to be sure, this was prolonged over three hundred and sixty-five days instead of one. There were in 1891, 2,660 killed, and just about ten times that many wounded—26,140. In an ordinary battle in war where five are hit one is killed on the ground and one of the other four is apt to die. If that were so in this case, out of that 26,140 wounded 6,000 would ultimately die, and that added to the 2,660 would make 8,666.

I understand that unless a conductor or a brakeman or any one can show that he was without any fault himself he receives nothing for any injury done him. If the company can show that in any respect he contributed to his own injury, then they do not pay anything for it; they do not give his family anything in case of his death; but when they kill a man carelessly—and the larger part of it is carelessness and nothing else—then they give a magnificent donation of \$5,000, and if 5,000 men are killed a year and paid for, that amounts to \$25,000,000 a year that the railroad companies lose; and that is a tremendous interest on \$75,000,000.

Figures are not the most reliable things in the world, but these are figures you cannot escape from unless you say that those 5,000 poor fellows who were killed in that way nearly all contributed to their own death, and the law of course gives no remedy if they in any respect contributed by their own negligence. It is a very fine question how much of the negligence is the company's and how much the employee's.

There were 9,153 railroad employees killed in four years and 88,712 wounded, and yet nothing can be done about it. We are told it is better to let this killing go on without any attempt whatever to prevent it, because they say they do not know exactly what they are to do. They say they cannot agree as to what should be done, and inasmuch as people cannot agree about what to do it is better to do nothing. There I differ with them again.

The case presented in the senate of the United States was in many regards extraordinary and unique; a case in which United States senators demanded the passage of a law to prevent accidents and guard employees against being killed and maimed. Said Senator McPherson:

We should consider the great number of men necessarily employed in this business, the loss of life, the statistics of which were given here yesterday by the senator from Illinois [Mr. Cullom], and the maimed condition of these people by reason of the risks they run in coupling cars, forced as they are to handle the old and antiquated cars that the railroads have had in use for years, and never will throw off of their lines until they are compelled by legislative power, this legislation seems not unreasonable.

They will wear out these old cars if not prevented, because it is more profitable to them. When we consider those conditions, it is the duty of congress in my judgment to make some legislation that will require the use of inventions which human ingenuity has discovered and devised by which the risk may be reduced to the minimum.

It is but a few years ago that here in this chamber a bill was passed to regulate the transportation of live animals. It was claimed that the then system was cruel to the animals; that it was injurious to the meat; that it produced

disease. What was the result? Legislation was passed by congress requiring that animals should be removed from the cars every twenty-four hours for rest and water and feed in order that cruelty to the animals might to a large extent be avoided and in that way benefit the meat product.

There was another provision in the law that this requirement would be waived as soon as cars were constructed that would enable animals to be fed and watered while in transit. What is the condition to-day as a result of that legislation. There is scarcely a train of cattle coming from the great west to the east that is not carried in improved cars. The railroad companies themselves own but few of them. They are owned by the great car trusts. There is hardly a pound of dressed beef brought from the great west to New York for export to Europe that comes in cars owned by the railroad company itself. But each of the cars contains all the modern appliances. They have air brakes; they have springs under them; they have improved couplers.

No brakeman is required to go between the cars of those improved trains to couple them. The car trust does not receive one single fraction more for the use of those improved cars than it would receive for the use of the old cars where the brakeman is forced to go in and hold up one end of the ring while the cars are being coupled.

In the foregoing, it is shown that congress was quick to respond, when it was ascertained that the transportation of live animals subjected the dumb creatures to suffering, and it is shown that the legislation was productive of good results. Senator Call, in the course of the debates, said:

Mr. President, the question of the control of railroads by law, of which this is a part, is one of the most important that can be presented to the consideration of congress. The American people in their public opinion are eminently practical, and they have not failed to see what everyone else has seen, that this vast interest of more than ten thousand million dollars, employing 750,000 men, carrying between ten and twelve million passengers every year, with revenues greater than those of the federal government, constitutes a power that if not controlled by law, and positive law, will create a privileged class, an aristocracy, an imperial government, and that the people must be powerful enough in their national government to prescribe reasonable and just laws for its control.

The only alternative to this, unless we can contemplate the overthrow of the government, will be that the government will assume the control of these great highways and these vast interests. For one I am not in favor of eliminating private enterprise and energy and ability from the control of these great corporations subject to the will of the people and the law that congress may prescribe.

Now, Mr. President, what does the pending bill propose? It proposes to assert the recognized power of congress to require of these common carriers engaged in interstate commerce that they shall provide adequate protection to the life of the men employed, who make all the money, who render all the service, upon whom absolutely are dependent not only the lives and comfort of the passengers and the safety of the merchandise but the profits of the men who

own it; that we shall require them to use the necessary and the best appliances for the protection of the lives of these people as well as of the 12,000,000 American citizens, men, women and children, who travel upon these roads. Is it reasonable to say, as the senator from Virginia [Mr. Hunton], if I understood him aright, said that this great interest should be exempted from the control of the people and their power; that these corporations of their own accord would do whatever was best and whatever was necessary and proper?

Mr. President, the answer to that is in the fact that of the ten thousand million dollars of capitalization nearly one-half of it represents nothing whatever but the paper upon which it is written and the power of taxation of the American people. That is an instance of exemption from the control of the law.

I have here a table prepared by a very careful and a very intelligent man, who seems to be thoroughly familiar with the subject, Mr. C. Wood Davis, who states that the revenues derived from freight and transportation charges upon the American people have been \$2,500,000,000 upon watered stock, that represents nothing whatever—over \$2,000,000,000 taken from the American people.

Is there any impropriety in the face of this vast amount over and above every dollar that has been contributed to the construction of these roads to require them to expend the \$75,000,000 or \$100,000,000 if it is needed for the protection of the lives of the men who do all the duty and the labor at night and by day for an inadequate compensation, who make all the money for the men who live in luxury in palaces and never put their hands to this great work which is done by the laboring people whose lives have been thus sacrificed.

Such statements in the United States senate are calculated to carry convincing weight to the public mind. They are not made by members of organized labor, nor by "labor agitators," though as extreme as any utterances of labor agitators; they are made in the calmest and most dignified deliberative body in the world, and are made under the sanctity of an oath.

The indications now are that within the next five years the old death dealing appliances will disappear and the safety appliances will take their places on the trains. When it was asked, if railroad corporations could not be trusted to remedy defects in train appliances, the reply was made by a senator that he "never saw the time when people, situated as the railroad companies are, and as other corporations are, were ready for remedial legislation of this description. I never knew the time when the shipping industry was ready to be regulated as it ought to be ready to have its barbarisms eliminated. We have been telling them of late how many cubic feet they must allow for proper ventilation in accordance with the law of hygiene as prescribed by skillful surgeons and physicians, but the ship owners took their medicine unwillingly." In confirmation of his position he referred to the "extraordinary agitation in England some years ago, and

very interesting it was indeed, when an investigation of British shipping showed that large numbers of vessels, in order to get the insurance, went abroad consciously unfit to go to sea, expecting that they would blunder on to the shore or founder at sea. Then that fine old English bull-dog, Plimsall, took hold of this business and worried parliament, as some of us are worrying congress to-day, until he got a proper load-line painted on the side of every ship, so that anybody could tell whether she had been overloaded or not." England had trusted her ship owners and thousands of lives had been lost. It was found they could be trusted no longer and parliament interfered to save life. During four years it was shown that 9,153 men had been killed and 88,712 wounded as a result of imperfect appliances, a total killed and wounded of 97,865. Safety appliances will lower the horrifying record—to what extent is not known, but that it will be to an extent that will excite universal satisfaction is believed.

Railroads derive their existence from law; from the people; from congress; and from the states; and, therefore, can be controlled, and the people have determined to control them, and it will be eminently becoming for the roads to submit with the least possible amount of kicking.

---

## ARE WE A PROSPEROUS PEOPLE?

---

Mr. B. O. Flower, in the *Arena* for January, asks, "Are we a prosperous people?" and proceeds to demonstrate that we are not a prosperous people. Mr. Flower reiterates the statement that "the accumulation of great wealth within a country's borders does not necessarily indicate that the nation is prosperous," but if this accumulation of great wealth within a country's borders is fairly distributed, then, in that case, it would indicate the nation's prosperity.

To prove that as a people we are not prosperous, Mr. Flower refers to the vast number of evictions occurring annually in the city of New York, which for the year ending Sept. 1, 1892, aggregated 29,720, and

if five persons are allowed to a family, "which is the usual ratio in computing population," we have an army of miserables numbering 148,600 men, women and children thrown upon the streets without home or shelter. The picture has no side that can be contemplated with satisfaction. It is horrifying from first to last; but does it prove that we are not a "prosperous people?" These evictions occurring in the city of New York suggest the question, is New York a prosperous city?

We presume if the question, is New York a prosperous city? was addressed to any resident of the great metropolis competent to answer, the reply would be in the affirmative and any quantity of statistics would be promptly introduced to substantiate the affirmation; and if the statement were made that 29,700 families had been evicted during 1892, we apprehend the fact would be admitted and immediately statistics would be produced showing that from all quarters of the earth, poor and destitute people have flocked to New York to take the chances of a precarious existence, rather than "go west and grow up with the country;" that these imputed evictions of poverty, ignorance and degradation, Huns, Dagoes, Poles, Russians and others who could be named, are willing to crowd into cellars and garrets, rather than go further and fare better, and that their impoverished condition, which is their normal condition, presents no argument against the prosperity of the great city. Mr. Flower graphically paints a dark picture when he says, "Let us imagine the spectacle of this host of haggard, half-starved men, women and children—the army of the overpowered—ununiformed, in rags and tatters in mid-winter, divided into one hundred battalions of one thousand each; with sable colors and muffled drums; with eye made dull by hopelessness or baleful despair—a section of the human family in full defeat—marching with mournful tread past the lordly palaces of Fifth avenue, and gazing wistfully through the windows at the dazzling splendors of homes whose owners represent hundreds of millions of acquired wealth." The picture painted by Mr. Flower, though well calculated to arouse sympathy for the unfortunate, does not prove that New York is not a prosperous city. On the contrary, the fact remains that New York is one of the most, if not the most, prosperous city on the continent—possibly the most prosperous city in the world; and just

here the point can logically be made, and should be made, that the prosperity of New York should be utilized by its fortunate citizens to mitigate the sufferings of its vast army of poverty stricken inhabitants.

In announcing such claims for charity upon the extraordinary wealth of the city of New York, it is not required to assume that New York is not prosperous; on the contrary, the claim for extended philanthropic work is predicated upon the wealth and prosperity of the city, and not upon its bankruptcy. If one suggests a remedy upon eleemosynary lines, the reply would be that if the unfortunates of 1892 were relieved, the number for 1893 would show such an augmentation of numbers, that to keep up the alms giving would speedily exhaust the resources of the city, since from Europe and from a number of states contiguous to New York City, a ceaseless stream of men, women and children are pouring in, subjecting themselves voluntarily—at least the adults—to the very conditions Mr. Flower so much deplores—it being a case where “progress and poverty,” wealth and want, go hand in hand. In such cases, what practical steps could be taken to mitigate the woes of extreme poverty? Confiscate the property of the rich? No; but since it is the work of the poor that makes New York prosperous, builds for the few stately fortunes, let them be taxed to create a fund, which, while it would not banish poverty, would take a million pangs a minute out of the hearts of the cold, naked, hungry and shelterless, and thereby reduce the horrors of which Mr. Flower writes.

Mr. Flower is, we think, of the opinion that we are not a prosperous people; the conclusion evidently being that where poverty, squalor and degradation are found, as in the city of New York, it becomes preposterous to assume that the nation is prosperous.

Mr. Flower leaves the city and hies away to the country, to five of the great states of the west—Illinois, Iowa, Missouri, Kansas and Nebraska—and shows that on January 1, 1890, there were in the states named, 1,196,071 outstanding mortgages representing a mortgaged indebtedness of \$1,174,732,241, and that at the same date in the states named, there were outstanding chattel mortgages aggregating \$783,154,827.25, giving a sum total of mortgaged indebtedness of \$1,957,887,068.25. Mr. Flower makes some conclusions in the chattel mortgage item, but regards \$1,762,098,361.30 as a “conservative” sum total

for the states named. The figures are simply appalling, and contemplating them from Mr. Flower's point of observation, it is not surprising that he has arrived at the conclusion that we are not a prosperous people.

But after all, there are some other facts which will put a bright side upon Mr. Flower's picture of desolation. In the states named by Mr. Flower there are 218,255,000 acres of land; we assume it is worth \$10 an acre or \$2,182,550,000. In these states Mr. Flower shows the real estate mortgages amount to \$1,174,732,241. Admitting his figures to be correct, the difference between the value of the land and mortgages would be \$1,007,817,759, the land at \$10 an acre being about double the amount of the mortgaged indebtedness; not a bad showing for farmers, since it leaves the impression that they could pay off the mortgages and have more than a billion dollars worth of land remaining to their credit.

Mr. Flower, in his *Arena* article, occasionally leaves the field of severe economic discussion and indulges in sentimental writing. Having given his figures showing mortgaged indebtedness, he refers to them as proving "beyond cavil that while millions of the most industrious, sober and honest American citizens have toiled from boyhood past the meridian of life in a land wonderfully blessed by nature, they have as a heritage billions of dollars in mortgaged debts, and conditions which surely and with accelerating speed are forcing them with each succeeding year, into greater dependency upon those who have acquired vast fortunes."

This MAGAZINE, it is needless to say, is not an advocate of plutocratic methods to obtain wealth. We take no stock in monopoly, trusts, syndicates or other capitalistic combinations to extort money from individuals or from the public, but in the discussion of such propositions as Mr. Flower advances, it occurs to us that mortgages are not necessarily unmixed calamities; on the contrary they may have a sunny side. True it is, that any form of indebtedness which the debtors are unable to pay, is to that particular individual a calamity and mortgages may be in some regards the most calamitous form of indebtedness, since the payment may involve the loss of the home. But it were supreme folly to write of mortgages as necessarily indicative of nations decay, and this appears upon any simple analysis of the proposition, as for instance: A owns a farm of one hundred and

sixty acres free from all incumbrances. A desires to make improvements, he wants to build barns and fences, or purchase stock or implements, no matter what. To do this he must have money. A is a free agent. He has toiled to the "meridian of life" and has secured a farm. He wants \$1,000—to obtain it, he must borrow. Fortunately for him, he finds a man with \$1,000 to loan. The negotiations begin. B, the lender, will part with his cash in consideration of eight per cent. interest, secured by a mortgage on A's farm; A consents; takes the \$1,000, and gives the mortgage. In all of this what is there to be deplored? Should a law be enacted to deprive A of borrowing or B from lending? There are a thousand reasons why farmers borrow money and execute mortgages. There are doubtless numerous instances where farmers borrow money and mortgage their farms when the transaction is not prudent, but the farmer being a free man there is no power to forbid him from doing as he chooses, and just here all discussion upon this branch of the subject ends. As well enter the arena of business for the purpose of deploring debt and credit, by which transactions amounting to billions occur annually, to determine whether or not "we are a prosperous people." The amount of transactions to a business mind indicates very closely that we are a prosperous people in spite of the fact that multiplied thousands meet with disaster.

Mr. Flower regards the mortgaged indebtedness of the five states he names, as appalling when considered as an economic problem." He shows, as we have stated, there were 1,196,071 mortgages outstanding January 1, 1890, amounting to \$1,174,732,241. Who got the money? The farmers. What did they do with it? Mr. Flower does not state, but simply regards the sum total as "appalling." Why appalling? Is it not to be presumed that the men who obtained the money used it to better their condition? If so, where does the calamity appear? or in what way does the placing of such a vast sum of money in the hands of farmers to extend their operations indicate that we are not a prosperous people? Going in debt is not a calamity; if it were so, the clearing house statements, published daily and weekly, and the reports of loans by banks would overwhelm the mind in dismay. On the contrary, such transactions everywhere are accepted as proof of the prosperity of the people. Mr. Flower does not discuss such propositions. He fixes his eyes upon the mortgage indebtedness of five

states. He sees many mortgages foreclosed because the men who borrowed the money could not pay their debts, and then writes as if the bottom had fallen out of the universe as follows: "Think for a moment of the rivers of tears flowing from the sunken sockets of half-starved eyes; the muffled sobbing, which speaks of vanished hope from millions of once buoyant lives; the laughter of childhood frozen by an atmosphere of dread, if not despair; youth and maidenhood unschooled in books; bowed with incessant toil, and wearied in soul and body, while the sun of life is far below the meridian. Age, pitiful beyond words, broken beneath the wheel of fruitless toil; health gone; hope vanished and home lost that the usurers may be satisfied. Ashes of hope floating from thousands of homes, where a decade ago joy fed the flame of jubilant expectation and where buoyancy of spirit found expression in laughter's inspiring music." This will probably pass current as fine writing. It is highly poetic. It covers five great states with the sable draping of a funeral. We see "rivers of tears flowing from the sunken sockets of half-starved eyes," a wonderful stretch of hyperbole; then we are invited to contemplate the "frozen laughter of childhood," as also floating clouds of the "ashes of hope," ascending from "thousands of homes," and all of this because some farmers, who borrowed money and gave mortgages on their farms, failed to meet their obligations and lost their farms. Hence, Mr. Flower is of the opinion that we are not a prosperous people. If it were true that "rivers of tears," the result of farm mortgages, were flowing in the western states; if it were true that the "laughter of childhood" out west could be found in "frozen" chunks, things, sure enough, would look squally, but nothing of the sort could be discovered by a congressional committee of investigation, clothed with authority to send for persons and papers and to examine witnesses under oath.

For an economic writer, Mr. Flower is far too sensational, too imaginative, too poetic. It is to be admitted and deplored, that there is too much suffering in all our large cities, it is possible that there are too many mortgages. It is true that the rich contribute too little for the alleviation of the woes of poverty, and that capitalistic greed is one of the signs of the times that cannot be contemplated with serenity. Nevertheless, the United States is a prosperous nation and we are a prosperous people, and the figures supplied by Mr. Flower

do not "demonstrate," as he contends, "that honesty, thrift and sobriety are no longer talismen against starvation in this opulent nation"—such declarations are those of a vagarist.

A man familiar with the products of farms, forests, fields and mines of the United States, who is a student of our inland and coastwise tonnage, of our domestic and foreign commerce, and of our railroad transportation, whatever else may be said, is forced, by the towering facts, to admit that we are a prosperous people—the most prosperous nation on the face of the earth.

Finally, Mr. Flower, after presenting his picture of destitution in the city of New York and the desolation (?) resulting from farm mortgages in five western states where he, in fancy, sees rivers of tears, and the frozen laughter of childhood, is of the opinion that all could be changed if, (1) we could have a "larger volume of currency," and (2) if the nation would purchase the railroads and telegraph lines.

If the government owned the railroads the number of employes would not be increased, and thus the idle would reap no benefits from the purchase and control of the railroads, and the same is true of the telegraph lines, and if the government should succeed in making money by running the railroads and telegraphs, it is not presumed that any part of the profits would go to the poor of New York city, or any other city.

It is doubtless true that the states could enact laws which would squeeze the water out of railroad stocks and bonds and compel their owners to collect dividends on honest investments. It is doubtless true, that laws could be enacted to put an end to trusts and capitalistic combinations, by which the public is robbed, and it is possible, if we had a centralized government, *a la* Russia, a decree could be issued which would put a stop to farm mortgages. All of these things may be done when the people in their sovereign power determine to do them. In the meantime we feel satisfied that we are a prosperous people.

---

For the purpose of administering to their employes consolation in time of need, the officials of the Denver & Rio Grande railroad have appointed for each division, a regularly ordained minister, at a salary of \$100 a month, to act as chaplain. The same thing is done in penitentiaries.

## LABOR DELIBERATION.

At Muskegon, Michigan, the state federation of labor recently held a meeting and deliberated upon certain propositions relating to labor, law, military affairs and politics. "A short day for women and children," was proposed and adopted. It would have been better to have proposed that there be no work-day at all for children, long or short. Children should have no labor tasks. Their bodies and their minds should not be dwarfed and stunted by toil. Children all over the country are made physical, moral and mental deformities by excess in work, and the land everywhere is being filled with the degenerate progeny of women who were over-worked in childhood. When parents become so debased and brutified as to drive their children to work during their tender years, their children should be removed from their custody. They are disqualified for rearing children.

A proposition was debated to appoint a union workingman as the commissioner of labor for the state. A move in the right direction and eminently consistent with the prevailing policy in such matters, since, if there is to be appointed a commissioner of banking, a banker or an acknowledged financier would be sought for, and so on through the list.

A resolution was passed "favoring the approval by the people of all legislation, before it becomes operative." In this resolution is found all the ear marks of the impracticable in law making; a vagary of such proportions that even a cursory examination of it makes it ridiculous.

Suppose for instance a member of the legislature offers a bill, making it a felony to discharge a workingman because he belonged to a labor organization? And suppose the bill passes and becomes a law? What reason is there for submitting such legislation to the people for their endorsement? Suppose a legislature passes a bill appropriating money, say \$100,000, to defray the expenses of the session. To submit the question to the people would cost, say \$200,000. But suppose all the acts of a legislature, as contemplated by the resolution, should be submitted to the people, say 150 acts or laws. What would be the outcome of such a proceeding? The mere mention of such contingencies illustrates the folly of all such

schemes, and labor, when in council, should sit down upon them. They are the rankest vagaries—impracticable and practicably impossible.

The military question was brought forward by a resolution declaring it to be "contrary to the best interests of unionism for men to belong to the state troops." There were those in the convention who held that it was well "to have union men in the militia because in a pinch they would shoot over the strikers' heads rather than at them," and "during the debate on state troops one delegate created a sensation by stating that in one company of militia, the Flint blues, stationed at Flint, he knew of union men who were going to withdraw because they would not go out to fire on striking unionists." It is not surprising that labor conventions and assemblies are taking special interest in the militia business, the military machine, since it is becoming well understood that the states have no use under heaven for an army, except to respond to the requests of the Carnegies and Fricks and other robbers of labor.

Whether union workingmen should volunteer in such armies or keep out of them, is a question of two sides. But it should be borne in mind, that a soldier on duty is not permitted to exercise any discretion at all. Military power is absolute and is summed up in the motto, "Obey orders." If this is not done, the next move is a speedy trial for treason and such penalties as the court may determine. If a union workingman soldier is ordered to shoot down a brother workingman and should be detected in firing over his head rather than at his heart, he would very speedily find out his mistake. Hence we are inclined to the opinion, if a workingman does not want to kill or wound a workingman for striking when oppressed, robbed and otherwise outraged, he will act wisely by keeping out of the state's standing army.

A very excellent resolution was adopted favoring "the taxing of church property." There never was a rational reason why church property should escape taxation. In hundreds of instances, the church building, after going through the mummery of dedication, an auction is held and the pews are sold out to those who have the money to purchase, and those who have not are permitted to take the paupers' bench and go to heaven as freight. Whatever may be regarded as prudent for such church buildings as have their doors

thrown wide open for all without charge, there should be agreement upon the proposition of taxing those buildings which sell their seats for cost, as do theaters and other buildings erected for amusement and profit.

After all, it occurs to our mind that the overmastering demand in these days is to so unify and solidify labor organizations, as to realize that when one of them is attacked by capitalist rogues, all are attacked. For until this is done the triumphs of labor will be few and far between, and defeats will be far more numerous than milestones on a turn-pike.

---

RAILROADING in northern latitudes during the blizzard season becomes immensely expensive when compared with mild weather and normal conditions. It is said that during exceptionally cold weather "the efficiency of an engine has been estimated to be reduced from 30 to 40 per cent., while much more coal is required to produce the necessary power, adding largely to expense at the critical moments when fuel is difficult of access. As an instance of the incidental increase of work, may be cited the incessant trouble arising from frozen switches. Snow in melting fills the runways of the rods with water, which in again freezing to ice must be picked out laboriously by the constant labor of many men. When the immense expense of washouts and damaged bridges and road-beds is added to the innumerable lesser inconveniences demanding attention and skill, the cost of the cold to the railroads can hardly be estimated. Delays are, of course, unavoidable, entailing an accumulation of freight, which in turn disturbs general traffic at the very time when business is also diminished by a decrease in the number of passengers."

---

ONE of the drawbacks to profits in California railroading is the high price of fuel. General Manager Wade, of the California Southern, furnishes the following suggestive comparisons: Cost per train mile for fuel on the California Southern, 24c; on the Atchison line in Kansas, 7c; on the Wabash in Illinois, 4c; cost of coal per ton, California Southern, \$7.75; Atchison in Kansas, \$1.58; Wabash in Illinois, 91.6c.

## CONTRIBUTED.

### LANDLORDISM AND MONOPOLISTIC RENT.

---

BY GEORGE C. WARD.

---

I am in receipt of the splendid March number of our beloved MAGAZINE and find it indeed a thing of beauty—may it prove a joy forever.

I note that my esteemed friend, W. P. Borland, condescends once, more, to notice my peculiar economic theories, and returns to the attack with unabated zeal and renewed ardor. It is a pity that such exceptional talent and deep learning should be devoted to the hopeless task of denying a proposition which, in its correctness, is infallible.

Mr. Borland, in justice to me, should not try to quibble and endeavor to obscure the real issue between us. The basis of my proposition is this: Under the present system a tenant in paying rent to a landlord pays, included in such rent, any and all taxes which may be levied upon the land for which such rent is paid, although such taxes are ostensibly paid by the landlord. The present system of taxation of land values differs from the single tax, limited, only in degree and not in kind, such difference being that it is not the single (only) tax, other forms of property being also taxed. But if all revenues were raised by a tax upon land values only, and such revenues did not absorb the total volume of monopolistic rent, we should then have in force the system known as the single tax, limited. So soon as the tax was raised or increased to the point of taking as a tax the total volume or amount of rent, we should have the single tax unlimited, and no portion of rent would go to the enrichment of individuals, but it would simply go through the hands of landlords who held land by virtue of improvements, such landlords being merely tax collectors for the people or government. My proposition is this: Under such a system, the single tax, as is the case now with monopolistic rent, would be in the nature of an indirect tax, which would be paid by the whole people in proportion to their consumption of goods, wares, commodities and services. My correlative, or corollary, propositions are: 1st, That non-occupying landlordism is responsible for the absorption by individuals of monopolistic rent. 2d, That were use and occupancy the only valid claim or title to land, that in the case of lands occupied for income producing or profit making business, competition would entirely eliminate monopolistic rent, leaving only pure economic rent attend-

NOTE.—This article should have appeared in the April issue, instead of the one captioned *The Speculative Margin and the Natural Price of Land*, which was intended to be the second of the two in reply to Mr. Borland. By mistake, the second article appeared first.—ED. MAGAZINE.

ant upon relative advantage of business locations. These propositions I affirm and Mr. Borland denies. The elaboration of the discussion has introduced many apparently irrelevant issues, the discussion of which, however, may tend to a better understanding of the questions concerned.

Now, as to the so-called Gresham law, which Mr. Borland has so kindly elucidated with his simple illustration of the wheat and chaff, so admirably adapted to my obtuse intellect. Perhaps I should, instead of saying that the law itself was a fallacy, have said that fraudulent and fallacious was the gold-bug interpretation of the law, which holds that whereas, because from a denial of the equal right and privilege with gold, of free and unrestricted coinage into standard money of such quantity as may not be required for use in the arts silver has lost a good portion of its commercial value, that, therefore, silver is cheap and inferior money, which, even under a free coinage law would drive gold money out of circulation. In the course of a speech in the United States Senate, Senator John P. Jones, of Nevada, said concerning the Gresham law:

If a number of the gold or silver coins of any given denomination were deprived of part of their pure metal, and so made cheaper than the remainder, a successful circulation of the coins thus deprived would result in the melting up or exportation of the coins of standard weight. Writing of this, Mr. Jevons ("Money and the Mechanism of Exchange," American edition, page 84) says:

Gresham's remarks concerning the inability of good money to drive out bad only referred to moneys of one kind of metal. \* \* \* The people, as a general rule, do not reject the better, but pass from hand to hand indifferently the heavy and the light coins, because their only use for the coin is as a medium of exchange. It is those who are going to melt, export, hoard, or dissolve the coins of the realm, or convert them into jewelry and gold leaf, who carefully select for their purposes the new heavy coins—and avoid the light or abraded coins.

There is, however, a theorem which applies to all money, but which was recognized long before Gresham's time—although it has been erroneously called an "extension" of the law or theorem of Gresham.

That theorem is this: If, in any country, there are two forms of money, each of which is a full legal tender, and one of which can be obtained with less sacrifice than the other, the one requiring the least sacrifice will be the cheaper, and if the unit of that cheaper money will perform in every respect the same function in the payment of debts and settlement of all obligations that can be performed by the dearer money, then, for obvious reasons, the cheaper money will come into universal use, and the dearer money will disappear. But it does not follow that the cheaper money is bad money nor the dearer money good money.

The best money is always the money of the contract, that is to say a money whose dollar, whatever it may be made of, is equal in value to the dollar of the contract. If the money of the contract is the cheapest money, then that is the best money, that is the honest money, and that is the only tolerable money.

If that be the sort of "cheap" money that drives out the dear money, then manifestly the dear money is bad money.

There exists a base and vile conspiracy on the part of the money mongers and landlords of the United States and Europe to further degrade and debase silver and force this country onto the single gold standard, in the interests of the creditor class to the injury and

spoilation of the debtor class; the masses of the people. The unprecedented and inexplicable past and present outflow of gold is a part of this nefarious plot on the part of the money power, and the secretary of the United States Treasury is a party to the conspiracy, and proves himself the willing tool of the plutocracy, by refusing to use the option given him by the Sherman silver act, of redeeming the treasury notes of 1890 in silver coin and persisting in redeeming such notes in gold. The goldolators are just now straining every nerve and using every argument to prove that the heavy exports of gold are caused by the operation of the Gresham law, and it was this interpretation of the law to which I applied the term "fallacy."

Mr. Borland says:

What does the law say? Why, it says merely that "a superior and an inferior currency cannot circulate together; the inferior will drive out the superior." \* \* \* The law is indisputable, and Mr. Ward cannot produce a particle of evidence to show that it has been abrogated for a single instant, either in France or elsewhere."

If Mr. Borland uses this language from a goldbug standpoint, considering legal tender silver money as "inferior money," I emphatically say that *not* for a single instant, but for twenty years, the law has been abrogated in France, in which nation the ratio of silver to gold is 15½ to 1 against our ratio of 16 to 1.

The following table indicates the amount of bullion in the principal European banks upon dates named and the corresponding dates last year:

BANK OF ENGLAND.		
	Gold.	Silver.

Total last week . . . . .	£149,860,450	£92,578,747
Corresponding week 1891 . . . . .	130,326,238	89,985,167

N. B.—A pound is about \$4.80 in United States money.

The peculiar thing about the foregoing table is the fact that it shows that France, which nation has more than one-half of the silver in England and all Europe, has, nevertheless, managed to increase her holdings of gold by more than double the amount than has been accumulated during the year by England and the rest of Europe combined. Where is the Gresham law which holds that the cheap (silver) money must inevitably drive out the dear (gold) money? The gold bug interpretation of the Gresham law is a fallacy and a humbug.

Ex-President Harrison believes that the demand for gold for export is not only artificial, but that it is part of a scheme, international in its scope, having for its object the issue of bonds. When it becomes apparent that no bonds will be issued, his opinion is that heavy drafts upon the treasury gold will cease. I will remark, *en passant*, that the good roads agitation has for its ulterior aim the accomplishment of the same object.

Now for the discussion proper and Mr. Borland's arguments in rebuttal, to all of which, as I can understand, I will render an answer to the best of my ability.

It is noticeable that Mr. Borland, as much as possible, avoids valuable lands in cities, used for the absorption of wealth and tries to confine me to agricultural lands, used for the production of wealth. He waxes sarcastic and makes merry at my expense, because I contend that production and its relative cost has nothing to do with absorption and its relative profits. I am also, by his argument, convicted of the oversight of being too loose and careless in my definitions, not holding strictly to the difference between economic rent (produced by relative fertility in the country and relative location in the city) and monopolistic rent, the result of non-occupying landlordism. I concede the fact that there would yet remain a small degree of economic rent, were use and occupancy the only title to land, but contend most earnestly that monopolistic rent would entirely disappear.

In support of my correlative and corollary propositions I offered, in the February number of the MAGAZINE, the very likely and reasonable though suppositious case of twenty store rooms, all in one block, and, of course, each enjoying the same volume of business unless, indeed, there should be a slight advantage in being in the two corner locations. The readers of the MAGAZINE will remember that I put the rent of each store room at \$1,200 a year, and asserted that if the rooms were all occupied by tenants the natural price of the goods sold in the block each year was increased by just the sum of the annual rent, to-wit: \$24,000. I then stated that if one of the rooms was occupied by the owner of the land, or site, that the nineteen tenants protected such occupying landowner in the absorption of \$1,200 annual profits, above the profits he would receive were there no tenants in the block and no tenants anywhere else. Mr. Borland, taking up this illustration, does himself the injustice of endeavoring to confuse me and deceive his readers with a species of intellectual thimblereg game. He says:

If Mr. Ward had attended to my definition of "natural price," he would have saved himself the trouble of introducing that illustration of the store rooms. No, the \$24,000 paid as rent does not increase the price of the goods sold. Why not? Simply because rent is not a part of price. The merchant is enabled to pay a yearly rent of \$1,200 because of the volume of his business, not because the natural price of his goods is increased by the payment of rent. A location where 100,000 suits of clothes or pairs of shoes may be sold yearly is a better location than the one where but 1,000 of such things may be sold, supposing price in each instance to be the same, and the larger rent which attaches to the superior location is but the recognition of this self-evident truth; the demonstration is obvious.

And then contradicts himself and concedes my whole contention, while trying to hide the fact with a quibbling subterfuge. He continues:

Yes, the man who carries on business on his own premises has an income larger than the man who pays rent for his premises by just the amount of the rent, provided their business is of the same volume, and carried on at the same expense. But let the man who pays rent attempt to place himself on the same terms as to income as is the man who pays no rent by including his rent in the price of the goods sold by him, I am inclined to think he would soon discover his mistake.

Notice how adroitly he covers his retreat with the assumption that the natural price is that at which the nineteen tenants sell their goods and how he endeavors to convey the impression that their rent is not already included in the prices of their goods. How can a thing be taken out of that in which it is not contained? How can a man who carries on business on his own premises have an income larger, make a greater per cent. net profit than the man who pays rent for his premises, by just the amount of the rent, unless the rent is included in the price of the goods sold? Mr. Borland should take some of his own advice and learn what natural price is, before writing about it. I will affirm that the natural price in the block in issue, is such a price as will yield the man who occupies his own premises the same per cent. of net profit as is realized by those who pay rent. This may be economic heterodoxy. What if it is? The elucidations of economic laws, offered by political economists are not infallible. Henry George will concede this much concerning the views of Herbert Spencer. Were non-occupying landlordism abolished in the case of all land occupied for the purposes of trade, traffic and selling merchandise, the prices of all goods, wares and commodities would be at once reduced by just the amount now paid by tenant merchants to landlords and absorbed by merchants who occupied their own premises. Monopolistic rent would disappear, leaving only economic, or natural rent. More than this: private ownership of land would be virtually destroyed, because a man, upon removal, would have nothing of value to sell, except his improvements. This would be free land and natural trade in a state of freedom from artificial or monopolistic rent. The single tax proposes to substitute the government for the landlords and give us free (?) land upon the payment of monopolistic rent, such rent being included in the prices of all goods and commodities. Single taxers assert that the two prime factors in the production of wealth are land and labor. Now,

money (rent) charged for the use of land is neither land or labor and it is funny to find a single taxer claiming that there can be such a thing as a natural price, so long as rent paid for the use of land forms a component part of the cost of all wares sold for profit and all products produced for sale.

This communication is already too lengthy to admit of my discussing, within its limits, the questions concerning the speculative margin and the natural price of land, a consideration of which I must defer to a subsequent paper. I wish, however, to notice one more point Mr. Borland endeavors to make. He says:

Mr. Ward should not allow his mind to become confused by the terms "rent" and "landlord." He should try and think of them separately. The question is merely one of the incidents of the single tax. It does not turn upon the existence of landlords, either in their individual capacity or collectively. The question is just this: Should society decide to absorb all rent by taxation what would be the incidence of such a tax? Would it be (1), upon the persons paying such tax (direct tax), or (2), upon the whole body of consumers of products (indirect tax)? By saying that "an addition to rent would simply be an increase of the tax," Mr. Ward maintains the affirmative of the first question. To maintain the affirmative of the second question the assertion must be "an addition to rent would simply be an addition to the prices which consumers would be compelled to pay for all products.

That's about the size of it. It would simply be necessary to assert that as all monopolistic rent is included in the prices of all goods, commodities and products, therefore were all monopolistic rent taken as a tax, an addition to the tax would simply be an addition to the price which consumers would be compelled to pay for all goods, commodities and products. The reasons are obvious. Monopolistic rent, charged for the use of land, adds nothing whatever to the productive capacity of either land or labor, nor does it increase the value of trade. It must, therefore, increase the cost of production and raise the scale of mercantile prices or it must reduce the wages and profits of productive and distributive labor, or, to some extent, do both. Were land made free and the payment of monopolistic rent to landlords, and its absorption by occupying land owners cease, the gross price paid by consumers for the total volume of exchangeable commodities must necessarily be reduced by just the amount of monopolistic rent thus abolished, or else the wages and profits of productive and distributive labor must be increased by just such amount, or such amount may proportionately work out such results in both directions, so that prices might be somewhat reduced and wages and profits somewhat increased, those who now absorb the monopolistic rent losing the amount represented by such increase and reduction. In a natural state of freedom, wherein the prime factor in production—land, is free from the burden of monopolistic rent, the natural price of exchangeable commodities is fair wages to productive and distributive labor. Monopolistic rent robs and oppresses the people, either by increasing the price of exchangeable products or by reducing the wages of productive and distributive labor, or, to some extent, in both wages.

Mr. Borland should not allow his mind to become confused in the

effort to demonstrate that monopolistic rent could continue to exist in the absence of non-occupying landlordism. Natural rent, arising from differences in relative fertility and location might continue to exist, but it would be but as a drop of water, compared with the ocean of tribute now exacted from labor by land monopolists.

## A WORKINGMAN'S CONGRESS?—YES.

---

BY NATHANIEL R. PIPER.

---

In the advance sheets sent me of the *LOCOMOTIVE FIREMEN'S MAGAZINE*, I read with extreme pleasure the proposition of the alert editor to discuss the propriety of a workingman's congress.

Being, as the spiritualist would say, *en rapport* with him, I hasten to acknowledge my approval of such a move, and to testify of my confidence in the value that must of necessity result in such a convention, to every man who has enlisted himself in labor's cause.

Like Bro. Debs, I appreciate the worth of our organizations as now constituted; but time has proven their insufficiency in dealing with many of the most burning questions that labor must have a voice in settling, or forever suffer for their silence.

Let us have a labor congress that shall be to all classes of laborers what the Pan-American congress was to the republics of the North American continent—a place to cultivate reciprocity. Let the producer as well as the consumer come in, for no great work will be accomplished if these two great classes are alienated.

The plutocratic press has always busied itself in teaching that there were natural barriers between these two classes. But I have had repeated evidence—and not merely a preponderance of it, but evidence beyond a doubt—that our neighborhood, our interests, are more closely identified than are the interests of the United States and any sister republic. Indeed, I have no hesitation in saying that the interests of producer and consumer are as closely united as are the separate interests of the several states of our national union. And when men representing the two great interests meet upon the same platform, the truth, as I have stated it, is always made apparent.

I do not understand the very able editor in his remarks to include the producer, or, more strictly speaking, the agriculturist. Yet I am sure that any movement that leaves him out will be in some sense disappointing. I need hardly say that I have rather enlarged views of what might be accomplished by the wage earners alone, but surely no sufficient reason can be given for ignoring the agriculturist, whose interests are as nearly parallel with the wage earner as are the inter-

ests of any two classes of wage earners who serve in different departments.

Let it be understood in the call for such congress, that the delegates representing the various industrial classes will be called to pass upon all the leading questions of the day that affect industrial interests. The plan of work pursued by the Pan-American congress would, perhaps, be as favorable for forwarding the work in hand, and at the same time would as thoroughly consider the details, as any that could be adopted.

One great and far reaching good is sure to result from such a congress—the question of whether or not laborers' interests clash, will be forever settled; and with that settled, the way is open for any needed movement to succeed. How easy then would be a triumph at the ballot-box. That great privilege (of voting) is not, was not by the fathers designed merely to foist into power some party whose name we have been taught to adore, but was expected by the founders of this commonwealth to be used as a means of endorsing our own interests upon every state and national question.

The results of the deliberations of a properly constituted workingman's congress would be equivalent to a platform of political principles that should and no doubt would meet the approval of every man who labors.

The sovereignty of the people is a farce unless the people can be heard and can dictate their own policies. Our government is unquestionably too far removed from the people. The Senate is made up of men who are in no far-reaching sense the choice of the people. The House of Representatives is thirteen months distant, which makes it scarcely more a representative body. We elect a representative who we know to be in sympathy with the demands of the people this year; next year new demands grow out of changed conditions, and perhaps our representative may be opposed to them; yet he is just now ready to take his seat. Another year and we must elect again, but we find our member not in sympathy with present demands, hence we nominate another. This is an intimation to him that we do not endorse his views. How now will he in all probability vote, seeing that he has been laid on the shelf?

Then comes in the veto power of a president who may or may not be a man of the people's choice.

The cabinet, who are the president's advisors, are seldom or never chosen from the popular house, but from the senate, or because they with the president have been guilty of forming cabals.

Now, under this regimen, start a bill in favor of labor; watch it in the hands of representatives that know themselves to be laid on the shelf; see it suffer from a filibuster, then to a senate that cares nothing for the people. Should it run the gauntlet here, it become a question for the consideration of a cabinet of non-representative men. Is it any wonder a bill looking to the interests of labor is universally strangled?

By all means let labor be heard, and heard upon every question that affects their interests. Tally one in favor of a "Workingman's Congress."

## WHO IS FAIR, AND WHO IS HAPPY?

BY JOHN S. MOSS.

After reading J. Hampton Moore's article in the January MAGAZINE it occurred to me that he, after the manner of the great Depew, was trying to please only those who think as he does, as he gives us his idea of fairness, and then wishes us to be fair and be happy. He objects to the laboring class drawing the line between themselves and the rest of American society. No person will dispute the right of any other person to become wealthy, providing he does so honestly. Can any one claim that all tramps are vicious? At least one-half of our American tramps are good, honest men, thrown out of work through the greed of such men as Carnegie, Frick, and Vanderbilt. How are these tramps to strive for their own success when they are confronted at every turn with a black list?

I cannot agree in ascribing our unhappiness to the fact of others having better success. It is not common for one man to complain of another's advancement, providing the advancement is the result of merit and not favoritism. All honest men will agree that the man in the counting room is a laborer, but the idea of his working from morning until night is not exactly correct; we find that from six to eight hours per day are about the average hours of work for these laborers and why not so with us? Gould was, no doubt, the friend of the railway employes; it is the breed of stock gamblers who are execrating his memory. As for Carnegie, what has he done to be compared with Gould? Has not Carnegie stood quietly by while his manager turned out honest men and their families, causing small children to suffer, and then tried to excuse his inaction by telling the people that he is so situated that he could not prevent the trouble at Homestead? What good has Carnegie done? Is it doing good to be connected with such treachery as has been, and is still being carried on at Homestead? Can it be supposed that we would never have had such steel works as those at Homestead, had Carnegie never been born?

It is impossible to entertain any such idea. Demand would have caused some other person to start these works, supposing Carnegie did not exist. Very few persons ever think that the rich man's life is all sunshine; but, does the poor man have any more happiness than others? The picture of the honest workingman in his home, with a safe amount put away for a rainy day, looks nice, but what has he to insure him that his investment is any safer than his rich friend's is? The rich man's home is certainly as pleasant as the poor man's, then what else has he to fear, if not the loss of wealth? Mr. Moore says he would lay a wager that one thousand firemen could easily be picked out who are happier than Gould ever was. I cannot believe but, with all Gould's worry, he was happier than the average fireman. Imagine a man, having a loving family, called

away from them to go out on his engine. Can such a man be perfectly happy? It matter not how brave he may be he is still haunted by a constant dread that he may be brought home on a stretcher, and he cannot be happy when he thinks of the agony such an event would bring to the loved ones whom he has kissed good bye before going out. Can such a man be more happy than Gould was? Mr Moore speaks of Carnegie's daily work in connection with his great contracts, in contrast with the happy fireman in his home. Why not picture the unhappy Carnegie on a stage coach, going to his Highland Castle, and the contented fireman trying to extricate himself from a burning wreck. Then ask that one out of a thousand to exchange places with Carnegie, and see what answer you would get. What would be thought of the honest fireman—I call them honest, since from Mr. Moore's article I conclude there are no others—should they notify a company that their expenses were so large that they must have the company reduce their dividends in order to pay more wages; then upon the company refusing to do this, the firemen to call out the state troops to shoot them down? This is usually the way Carnegie and some other do when their employes refuse to have their dividends reduced. Then it is a question of might, not right. It matters not whether our wives and children get meat with their bread or not, so long as our employers get their castles and yachts. I would say act honestly your part, not well, as a man may act well yet not honest.

---

## SHORT STUDIES IN POLITICAL ECONOMY.

---

BY WILFRED P. BORLAND.

No. 5.

All of our modern ideas concerning property have been derived from Roman law. The perceptions of all primitive societies have been to lead them to recognize the right of individual property in articles of wealth while insisting upon the common rights to land. The researches of Laveleye, Maine, Lafargue and other anthropologists prove this beyond a doubt. The Roman principle of law which is taken to justify the right of private property in land, is that of occupation, or occupancy. This was considered, by the Roman lawyers, as one of the natural modes of acquiring property.

"Occupancy is the advisedly taking possession of that which at the moment is the property of no man, with the view (adds the technical definition) of acquiring property in it for yourself. The objects which the Roman lawyers called *res nullius*—things which have not or have never had an owner—can only be ascertained by enumerat-

ing them. Among things which *never had* an owner are wild animals, fishes, wild fowl, jewels disinterred for the first time, and land newly discovered or never before cultivated. Among things which *have not* an owner are moveables which have been abandoned, lands which have been deserted, and (an anomalous but most formidable item) the property of an enemy. In all these objects the full rights of dominion were acquired by the occupant who first took possession of them with the intention of keeping them as his own—an intention which, in certain cases, had to be manifested by specific acts. It is not difficult, I think, to understand the universality which caused the practice of occupancy to be placed by one generation of Roman lawyers in the law common to all nations, and the simplicity which occasioned its being attributed by another to the law of nature. But for its fortunes in modern legal history we are less prepared by *a priori* considerations. The Roman principle of occupancy, and the rules into which the juriconsults expanded it, are the source of all modern international law on the subject of capture in war and of the acquisition of sovereign rights in newly discovered countries. They have also supplied a theory of the origin of property, which is at once the popular theory, and the theory which, in one form or another, is acquiesced in by the great majority of speculative jurists." Sir H. S. Maine, "Ancient Law."

We have ample evidence, from the records of primitive societies, notably of the Villiage Communities of India, that this principle of occupancy was not recognized as one of the natural methods of acquiring property, but was rather the outgrowth of a refined jurisprudence and a settled condition of the law. The Villiage Communities spoken of are of immense antiquity, and existed, as organized societies, at a period long anterior to the dawn of authentic Roman history. But we are principally concerned with this principle of occupancy as being the acknowledged source of our own ideas of property, and we may derive some instruction from noting the effects of the application of the principle upon the agrarian condition of the Romans.

"At the bottom of all the civil dissensions which now (B. C. 493) distracted the state of Rome lay *the question of land*. The territory of the commonwealth was limited. The land had been acquired by conquest. Since, from the early days, the patricians had virtually constituted the state they claimed and exercised the right of dividing all the conquered lands among themselves. As the plebeians grew to be an important element in the political society of Rome they began to claim their right to share in the distribution of new lands, to the conquest of which they had contributed as much as the patricians. But this claim was disallowed by the ruling classes.

"After the expulsion of Tarquin, the Patres relented to the extent of conceding certain lands to the plebeians on the same terms as those under which their own estates were occupied; namely, the payment to the government of one-tenth of the income. Subsequently still larger distributions of conquered territories were made to the plebeians, but always with such restrictions and discriminations as tended

to engender discontent. Cultivation was made a condition of the gift, and the poor peasant, whose resources consisted of cattle and sheep, was only mocked by the offer of what he could not possess. The principle of debt, too, with the usurious rates of interest which were charged, tendered constantly and powerfully to throw all of the lands into the hands of the nobles, and to reduce the plebeians to the level of serfs. The Roman commons became day laborers on the estates of those who were their masters in all but the name. For this state of affairs there was no remedy except to strike at the root of the system, and change the principle which had hitherto governed the distribution of the public lands. The partial concession which had been made had thus far affected only the wealthier plebeians, and this to the suffering poor had been an injury rather than a benefit; for the more powerful of their own class were thus drawn over to the patricians, who persisted in claiming the full right of disposing of the *ager Romanus* as they would. It was in this emergency that Spurius Cassius, a patrician of noble birth, came into the *comitia centuriata*, and proposed the first agrarian law. He was himself a man of great influence in the state, having twice held the office of consul. He had conducted two successful wars, the first with the Latins, and the second with the Hernicians. Both of the conflicts had been concluded with treaties favorable to Rome, whereby considerable accessions had been made to the public domain. Cassius now proposed in the assembly that the newly acquired lands, instead of being offered for occupation on the old conditions, should be freely distributed to the plebeians and subject Latin population. His proposition went so far as to reclaim—in case the new lands should prove insufficient in quantity—certain parts of the public domain previously distributed to the rich. This radical movement on the part of Cassius awakened the most violent opposition. The patricians were greatly embittered; and the wealthy plebeians selfishly added their influence to the opposition. The patricians claimed that Cassius was violating the Roman constitution by proposing in the *comitia* a measure which could only lawfully be discussed by the senate; and that the measure itself was against the common right of property, since it touched the redistribution of lands already acquired. Even the plebeians were dissatisfied with the proposition made by their friend, since it included the Latins with themselves in the new assignment of real property. Nevertheless the measure was adopted by the *comitia*, and the patricians contented themselves with preventing the execution of the law. At the expiration of his consulship, Cassius was charged before the senate with aspiring to kingly power, and after a trial was condemned to death. With the fall of the people's friend the patricians became more haughty and severe than ever." Ridpath, "Cyclopedia of Universal History."

We will continue this subject in our next.

## A REJOINDER ON GOVERNMENT OWNERSHIP.

BY CYRUS FIELD WILLARD.

Either Mr. James L. Edwards, who has an article in the March number, is incapable of understanding the English language or he has not read the article he presumes to criticise. All his objections are answered beforehand, and I am surprised that anyone, after reading it, should then presume to state these objections, were it not for the thought that is forced on my mind, that the article is simply written for the purpose of displaying the author's familiarity with figures. It is a very easy matter to introduce a barrelful of figures into an article, especially as was done in Mr. Edwards's article, "Shall the people own the railroads?" which figures prove nothing.

Although I am a member of the American Statistical Association, (and we are told that statisticians are proverbially prone to juggle with figures), I purposely abstain from using any figures whatever, because the question of mileage and valuation has nothing to do with principles. I trust that Mr. Edwards is possessed of sufficient power of analysis to understand this last statement.

Mr. Edwards says, "Mr. Willard asks, 'Shall the people own the railroads or what?' I suppose, 'Or not.'" This is a supposition which is unwarranted if he has read the article which he criticises. The "or" in the title was explained later, "or shall the railroads own the people." He goes on to say, "I suppose Mr. Willard's idea is, that the people should purchase them." Another supposition: why does he not read the article he criticises?

There are two ways of acquiring them by the people; one by purchase, and the other by confiscation or rather expropriation.

He says if the people, *i. e.*, the government, should propose to buy the railroad, the question arises, "How is the money to be raised with which to pay for it?" As was expressly stated in my article, there is no need of money. It is simply the question of exchange of government bonds for the bonds now held by the individual bond holders of the railroad. It is not the question of issuing bonds and selling them in order to raise money. It is the same question of the exchange and convertibility of six per cent. bonds into four per cent. bonds.

I would like to ask Mr. Edwards if government bonds are not as good security as any railroad bonds, and also whether there are any railroad bonds whose rate of interest is as low as government bonds?

The question at issue in the whole matter is stated in the title of the article, "Shall the people own the railroads or shall the railroads own the people?" The railroads have the right to tax the people to-day, to the amount of the gross earnings, or \$1,096,761,395. A princely revenue! Yes! beyond princely. The question as stated again is one of principle. Have not the people the right, and, in fact, obligation to assume to themselves the power of raising this taxation?

Let Mr. Edwards, who seems to be so fond of figures, consider these facts. The total capitalization of railroads in the United States is \$9,829,475,085, or about \$61,000 per mile; the net earnings are \$364,873,502, equal to a little over  $3\frac{7}{10}$  per cent. on the capitalization, watered stock and all; the outstanding indebtedness of railroad corporations in 1890 was over eight and one-half billion dollars,—to be more exact, \$8,318,716,000. If we consider that one-half of the capitalization given above represents watered stock, (and this is a fair estimate), we find that the capitalization less the watered stock is about six and one-half billion dollars, or two billion dollars less than the outstanding indebtedness. Does it not seem plain to him that the railroads have not only been built on borrowed capital, but that several million dollars additional have been borrowed? It is safe to assert that the railroads of this country have been built on capital borrowed by corporations that own them, and that about one billion dollars will represent the capital supplied by the corporations and those who control them. This is shown by the fact that of the outstanding indebtedness in 1890 only one billion one hundred and fifty-one million dollars was in the hands of the corporations and those who control them.

Now, when Mr. Edwards has digested these figures, perhaps he will come to the conclusion that government bonds would be a much more valuable and safer security than railroad bonds, and that the people who own the railroad bonds would make the same jam and rush about the sub-treasury department to exchange them for government bonds, as was the case when the  $4\frac{1}{2}$  government bonds were converted into 4 per cents.

He says that the only way that the people could own the railroads would be to confiscate them, order out the army and take possession of them. This is sheer rot and nonsense. Does Mr. Edwards forget that the only way that railroads can be built is by assuming that right of the state, the right of eminent domain, by which they take the power of the government and the government passes into partnership so far as to compel private individuals to sell out their land for the roadbed and terminals.

It is a very "jug-handled" partnership, however, because the private individuals comprising the corporation are the only ones who get any benefit pecuniarily. Now it is time for the government of the people to exercise the right of eminent domain for themselves and for their own benefit, and to assume control of the railroads under the same right that brought them into existence. When the railroads confiscated land by the right of eminent domain, there "was no violation of the constitution, the republic did not disappear and an odious autocracy did not take its place."

Yes, there were 784,285 men employed on all the railroads in this country in 1891; quite a standing army.

Let Mr. Edwards take into consideration the facts in the Kansas Legislature, when the Governor of the State called for troops to enforce his decision, which, whether it was legitimate or not, I am not prepared to discuss at the present time. When the Governor of the

state called for troops, was it not significant and startling that those in possession should call upon one of the biggest railroad corporations in the country to turn out its employees as an army in contradiction to the regular militia force of this state?

Mr. Edwards seems to think that the financiers of the world would stand aghast. I think and hope so, because one of their best methods of fleecing the public without the people knowing it, would be taken away from them.

He thinks that the locomotive firemen would not favor the scheme by which the government would be burdened with a debt of \$10,646,192, and an annual interest debt of \$425,847,680, for the great and blessed privilege of working for the government.

Let me ask him if this debt does not exist now, and whether or not the interest, debt and much more is not paid by the people of these United States? It is for the purpose of reducing this debt and the annual interest "steal," that the proposition that the people should own the railroad is advanced and also for the purpose of securing the eight-hour day, increased wages, and better conditions generally for the locomotive firemen.

Mr. Edwards misquotes me, when he refers to my view of government. He does not know my view of government, because I have not stated it. I stated that the railroads and their earnings controlled in private hands were responsible for the shameless debauchery of the state and municipal governments. Were the control of these princely revenues taken from the private hands which now control them, it would be impossible to use it for the purpose of corrupting state and municipal governments.

Can he understand this plain statement? As a matter of fact, if Mr. Edwards is sufficiently interested in the subject to go into it seriously, as he has not done as yet, I would refer him to the Australian system of government railroads, which has demonstrated my theory.

Fact is better than theory every time, and let him turn to those states where the railroad service is controlled by the state, and he will find the best service for the public. The fastest train in the world is between Berlin and Hamburg, and the German system of railroads, so far as the outside public is concerned, is probably better and more economically managed than the same length of railroad anywhere in the world.

The condition of the railroad employes is not as good as it would be in America with government ownership of railroads, because there an aristocracy of caste and tradition prevails.

I think Mr. Edwards' paper is about as shameless an exhibition of either ignorance of the matter to be criticised, or perversion of the facts, as one could expect to see from that side of the case, and that is saying much.

No one is more opposed to paternalism in government than I. But I would rather have the government of those whom I have a voice in selecting, such as congressmen, than the private autocracy of the governors of the Reading Railroad system, which compels a man to

shave off his moustache and levies tribute upon defenseless firms and business men of this country.

Taxation without representation was the cause of a great rebellion in this country. The same principle is involved in the private ownership of railroads. They tax us all, fixing, (as they themselves term it) "the tariff," not McKinleyized, for passengers and freight, and we have no voice in such fixing; simply the alternative of submitting or walking being presented.

I would have, as I have suggested in my article, the railroad service governed by the railroad employes themselves when once owned by the government. I can only outline the plan, and that is, that the employes of the road, formed as a complete federation, should select proper officers to be at the head of the big system, and it seems to me that no one is better qualified to judge as to the merit of those who are to rule over them than the ones who meet them every day, in shop and train service. This does not affect the principle. The principle, as I have stated before, is the one of taxation without representation, and the assumption by the people of this right of taxation which they have heretofore delegated to the railroads.

## THE COMING CIVILIZATION.

BY JOSÉ GROS.

No. 5.

(Concluded.)

The idea we have suggested in our previous article, of direct legislation by the people, sounds, at first sight, as the wild dream of a diseased imagination. And so it is, if we pre-suppose that the normal life of nations requires hundreds of laws every year. Can we prove that to be the case? If so, our nation should have long ago been in clover, a joy forever; because not only hundreds but thousands of laws are annually concocted by our national and state legislative bodies, all along, year in, year out.

I wonder if my dear readers have ever stopped to think about the causes to which we owe the real or apparent need of so many new laws every year. The reason is simple enough. Human legislation has never rested on any fixed principles, much less has it assumed the need of any fixed scientific order in national or social development. It has never even conceived the ideas of natural law and natural rights, of ethics to be respected among men, or anything like it. The actual theory of all governments has forever been how to get along, after a fashion, through the influence of the powerful at

the expense of the weak, in so far as to keep the latter quiet with as few surface rights as possible. The conception of certain universal fundamental rights, applicable to all men, and all classes, and all industries—that may have been embodied in a few high sounding sentences; but that has never been realized in actual facts. Favoritisms or privileges to certain men, to certain classes, to certain industries—that has been the real presiding thought of all governments and all legislation. Hence the multiplicity of human laws. Hence the organized anarchy of what we have been calling *progress*.

I can not really see how we can permanently change that form of progress unless we reverse the processes that underlie and feed the very developments we are forced to deplore of general anarchy and injustice in all directions. Hence the need of having legislation always and forever radiating from a few fixed principles, the fewer the better, representing universal justice, appealing to the plain sense of all men, easily apprehended by all men, aiming to the realization of all healthy, natural aspirations, never to the fancies of any set of men. And that is all there is about it.

The question is now as follows: Can we expect any such simplicity in legislation from any legislative body apart from the grand totality of the people, apart from at least a majority of those who produce all wealth and are always the victims of vicious legislation? History answers most emphatically—*you can not*.

When we study the general developments of all parliamentary systems, we discover a law just as immutable as that of gravitation, or chemical affinity, and that law is as follows: Place any set of men by themselves, give them the power to pretty nearly do what they like with the wealth of the social compact through any methods of taxation and monetary systems that human fancy may suggest, and that set of men shall use those two instrumentalities to enrich themselves and somebody else at the expense of 90 or 95 % of the race. That has been the invariable result of legislation through what we call legislative bodies in opposition to that from any monarch with a small council of his or from himself alone.

We are now forced to state that the so-called popular legislative bodies have, if anything, done worse for the people than the majority of despotic monarchs. Take as an instance, the fact that the plain people of England had 13,000,000 acres of land, as commons, under absolute monarchy, where they could pasture their stock, obtain their fuel, &c. Well, parliament has taken that away from the plain people of England in the course of a few centuries. And it is through our legislative bodies that we have managed to give away to the few, in about 100 years, the patrimony of immense unborn generations, besides that of the present and past ones, at least to a great extent.

Look, now, at the elements which constitute over 99 % of all legislation every year in all modern nations. You will see that it is all about how to fix methods of taxation; how to distribute the tax fund; how to intensify the monopolistic elements of all banking and monetary systems; how to create corporations with the power

to tax the masses under false pretenses of public good; how to extend privileges to such and such men and thus give them some advantages over the rest; how to create inequalities; how to transgress the law of universal justice. That is what gives occupation to legislative bodies. Suppress that element of selfishness and injustice in human laws, and the social organism would need mighty few laws.

Suppose, for a moment, a nation in which the system of taxation is fixed, for a number of years, as one of the basis of the social compact, fixed because resting on fixed wealth, wealth that cannot be hidden, wealth lying out doors, and therefore easily estimated, the fundamental conception of such a system being that of protecting public rights, and so preventing any manipulation of natural elements, land, etc.

Suppose, again, a monetary system also fixed, for a number of years, as another basic element in the social organism, fixed because of its volume resting on a certain relation with that fixed wealth we have spoken of, or, if you like, resting on a certain relation with the annual taxing power of the whole nation. That implies a monetary system based on direct government notes, excluding all banking privileges and all financial schemes tending to favoritisms in any form, to any group of men, large or small, and so respecting the equal rights of all.

Now, let us see about the distribution of the tax fund which would have to take place every year or two. Even that should be controlled by certain approximately fixed relations taught by experience, and grouped in three grand departments, viz: Administration, Defense, Improvements. All government expenses must necessarily belong to one of those three departments. A slight change in the proportions of the tax fund for each department is all that would have to be decided upon by the people, every year or two according to social developments, for the nation and locality.

The preceding three paragraphs involve the *essentials* in the science of government. The rest would follow as a matter of course. And mighty little else would have to be done in the realm of legislation if the three above items were done in accordance with principles of plain, simple ethics, honesty, justice and moral law.

Let us now descend to the rudiments of the political structure through which the above conceptions could be carried out.

1st. Only two political parties should, at any one time, be clothed with the legislative franchise for annual or biennial elections, when bills should be presented for the people to vote upon, on a fixed day, apart from any election for officers.

2d. Not over five political parties, including the two above ones should have the power to propose or present candidates for the principal executive officers in the nation, state and township.

3d. Legislative elections to be at least six months apart from that for executive officers, thus eliminating from politics the personal equation, as much as possible, in relation to legislative developments.

4th. The two partisan club leagues of the two parties mentioned

in section No. 1 in the ten townships with the most population in each county could propose one legislative act, embodied in not over 75 words, on each of the three grand legislative departments, viz: Taxation and its distribution; industrial improvements; civil and political improvements.

5th. A party county convention of all the club presidents in the county should, by a majority vote, choose one of the ten above bills of each department, if as many, and elect one member for the state convention.

6th. The state convention should go through the somewhat troublesome but not difficult process of mustering a majority, or at least a plurality, for one bill of each department among the bills of county conventions. The job could be simplified by classifying the counties in three groups, according to importance in population, and giving a certain due preference to the bills presented by the five or ten counties with greater population. We know that the evils of wrong legislation become most fatal as population groups itself in most compact centers or larger average densities.

7th. The national convention, with but one member from each state, could easily muster a majority vote for one bill of each of the three departments, out of the three groups of state convention bills, if as many as three.

8th. The three bills chosen by each national convention would form the party platform, the people to choose one of each in the three departments, from the two sets of the two parties, or less than the three, or to negative them all, always by a majority vote, so that politicians could never trifle with the people, each voter to choose but one bill of each department, as a matter of course. And there you have direct legislation.

9th. Any of the two parties, or both, having all bills negatived by popular vote for three successive elections should lose the legislative franchise, and the one or the two out of three other parties, with the greater number of votes in the previous election for executive officers would take the legislative franchise to prevent all partisan monopoly.

10th. The national convention could extend the bills from the seventy-five words mentioned, as a maximum, in section 4th, up to 500 words, if necessary, provided the essence should not be altered in the least.

11th. All public halls or the like in each town and city to be opened each Wednesday and Saturday, free to the people and all political parties, in turn, for the full discussion of all public affairs. That would enable each party league of clubs to exist without any individual expenses, and thus promote public spirit, without which political freedom is a farce.

We respectfully submit the above eleven sections to the consideration of thinking men, as mere suggestions, no doubt susceptible of great improvement, and as the rudiments through which direct popular legislation could be accomplished.

We are willing to grant that no great finality is apt to be reached but through many steps, because most men are always afraid of any rapid advance.

What we do desire to emphasize is that if we have a grand sound finality in view our advance can be more rapid and far more beneficent in general results to the whole human family.

## SACRIFICING IMPROVEMENTS.

BY B. C. STICKNEY.

---

In the March number of the Locomotive Firemen's MAGAZINE the contention is made by Mr. W. H. Stuart that when once a land owner has placed an improvement on his land, it is unjust for the public at any time thereafter to increase his taxes, no matter how greatly the land might increase in value, inasmuch as such increase of taxation would compel the land-owner to sacrifice his improvements.

If this idea of justice should ever come to prevail, a speculator might secure a few vacant acres in or near a new town, and on each acre erect a dog kennel or a mudhut. Then, with the growth of the town into a city, there would arise the necessity for water works, fire department, paved streets, public schools, public buildings, sewers, etc. The growth of the town would also increase the value of all the land on which it stood, including the speculator's acres. The city might extend until his lots would be among the most desirable for business or dwelling purposes. But he would not be called upon to pay any greater amount in taxes than when his lots were valueless, inasmuch as it would be unjust to raise his taxes and compel him to sacrifice his dog kennels and mud huts. The industrious portion of the community would bear the cost of the public works aforementioned, and when these were all completed and paid for, the speculator could remove his mud huts and dog kennels, and erect on his land dwellings and business blocks, and enjoy as fully as other people the advantages of the paved streets, water works, sewerage system, fire department and other public works, without having been obliged to contribute anything worth mentioning toward the cost thereof.

## SINGLE TAX FALLACIES.

BY W. H. STUART.

No. 4.

Is interest just?

What is interest and how does it arise?

Interest is defined as an income obtained without work and without risk. It is in this sense that Henry George uses the term, for he is careful in his definition to exclude risk and wages of superintendence.

There are two principal theories upon which interest is defined. The first is known as the "abstinence" theory; that is to say, wealth once produced can be used either for present consumption, or it can be used as capital—that is; to produce more wealth. The owner of wealth who devotes it to the latter purpose deserves a compensation for his abstinence from using it, and interest is this compensation. But a little reflection will show that while abstinence will account for capital, it will not account for interest *per se*. Abstinence will account for the owner having, say \$1,000 to loan, but it does not account for that sum growing to \$1,100 in a year's time. Abstinence may account for the ability of a certain millionaire to have been at one time the owner of a patent mouse trap, but it will hardly account for his possession of \$100,000,000 at his death. The impossibility of eating one's cake and still having it is universally admitted, but the taking of interest violates this supposed inevitable law. As for instance, when a man loans \$50,000 at 5 per cent. for twenty years, he receives the amount in twenty equal payments, and yet, the original amount remains intact. In this case, providing the amount loaned is his capital, he can, as the reward of his abstinence, continue to eat his cake and still have it; and his heirs can continue the process forever.

The other theory is, that capital is an independent factor in production, that is to say; that when wealth is put into the active form of capital—of which machinery may be taken as a type—wealth may be indefinitely increased. The difference between the value and amount of wealth when produced alone by labor, and when assisted by capital, is due the latter, therefore, interest is the "wages" of capital. Bastiat's well known illustration of the plane is an example of this kind of reasoning: James, a carpenter, at the expense of ten days of labor, makes a plane which will last for a year. William, another carpenter, offers to borrow the plane for a year and agrees to return at the end of the year, when the plane will be worn out, an equally good one. James objects to loaning the plane on these conditions, urging that he will lose the use of the plane for the balance of the year. William admits the justice of the objection and agrees to return at the end of the year not only a new plane but a plank in addition as interest. This agreement is carried out to the mutual

satisfaction: "William obtains the power which exists in the tool to increase the production of labor and is no worse off than if he had not borrowed the plane; while James obtains no more than he would had he retained the plane instead of loaning it."

George, in quoting this nursery tale of the facetious Frenchman is moved to remark: "And I am inclined to think that if all wealth consisted of such things as planes, and all production was such as that of carpenters—that is to say, if wealth consisted of the inert matter of the universe, and production, of working up this inert matter into different shapes, that interest would be but the robbery of industry and could not long exist."

"But," says George, and here follows his peculiar and original justification of interest: "But all wealth is not in the nature of planes, or planks, or money, nor is all production merely the turning into other forms of the inert matter of the universe. It is true if I put away money it will not increase. But suppose, instead, I put away wine. At the end of the year I will have an increased value, for the wine will be improved in quality. Or suppose, in a country adapted to them, I set out bees; at the end of the year I will have more swarms of bees and the honey they have made. Or supposing where there is a range I turn out sheep, or hogs, or cattle, at the end of the year, I will, upon the average, also have an increase. Now what gives the increase in these cases is something which, though it generally requires labor to utilize it, is yet distinct and separable from labor, the active power of nature; the principle of growth, of reproduction, which everywhere characterizes all the forms of the mysterious thing or condition that we call life. And it seems to me that this is the cause of interest, or the increase of capital over and above that due to labor. And so, in every circle of exchange, the power of increase which the reproductive or vital forces of nature gives to some species of capital, must average with all; and he who lends or uses in exchange, money, or planes, or bricks, or clothing, is not deprived of the power to obtain an increase any more than if he had put to a productive use so much capital in a form capable of increase."

"In such forms of production as consists merely in changing the form or place of matter, as planing boards or mining coal, labor alone, is the efficient cause—when labor stops, production stops. When the carpenter drops the plane as the sun sets, the increase of value which he with his plane is producing ceases until he begins his labor on the following morning. When the factory bell rings for closing, when the mines are shut down, production rests until the work is resumed; the intervening time, as far as production is concerned, may as well be blotted out. The lapse of time, the change of seasons is no element in the production that depends solely on the amount of labor expended. But in other modes of production which avail themselves of the reproductive forces of nature, time is an element. The seed in the ground germinates and grows while the farmer sleeps or ploughs his field."

George's theory and defense of interest therefore, is based on the

reproductive forces of nature, and the element of time, giving a value to capital—owing to equalization of advantages—quite distinct and separable from labor.

Böhm-Bawerk in his criticism of George's theory (*Capital and Interest*, pp. 413 *et seq.*) points out that; "The separation of production into two groups, in one of which the vital forces of nature form a distinct element in addition to labor, which in the other does not, is entirely untenable. George here repeats in a somewhat altered form the old mistake of the physiocrats, who would not allow that nature co-operates in the work of production, except in the single branch of agriculture. The natural sciences have long ago told us that the co-operation of nature is universal. All our production rests on the fact that by the application of natural forces we put imperishable matter into useful forms. Whether the natural power of which we avail ourselves in this be vegetative, or inorganic, mechanical or chemical, makes no difference whatever in the relation in which natural power stands to our labor." And he asks: "Can we not fasten the plane into an automatic machine, and get it driven by the force of a stream; and will not the plane continue the production even when the carpenter sleeps? What more does nature do in the growing of grain?"

It is also pointed out that the increase of ten grains of wheat from one, and of the calf from the cow, as being the result of forces separable and distinct from labor, is not so self evident as George appears to think. It is not so certain that one grain of wheat, plus the labor expended, is not the equal of the ten grains; or that the calf plus the fodder which it has consumed during its growth, and plus the labor which its raising demanded are not equal to the grown cow. In the case of the wine that has improved with time, it is certain that the values are anticipatory, values for future use. "But if we ascribe to it here and now a value corresponding to that future use there remains no room for an increase of value, and for interest." Nor can "time" which George claims as an indispensable element in the increase in the value of the wine become a monopoly for which interest may be claimed. As those "reproductive forces" are accessible to all, and as long as this form of production yielded a profit over other forms of production would not competition for these advantages inevitably tend to the average returns of labor from working up the inert matter of the universe. Indeed I fear it would be hard to convince the mortgage ridden American farmer of the justice of interest because of the exclusive advantage he possesses in the ability to call to his aid the "element of time," and the "reproductive forces of nature."

The reproductive forces of nature as a factor in the production of wealth as against interest at 5 per cent. is nowhere, as the following example will show. Had the widow who offered her humble mite in the synagogue 1900 years ago, placed it at interest at 5 per cent. compounded yearly, the "just return" to her capital for "aiding production," would now amount to, well, figures will hardly express it; but it would require a solid sphere of gold the size of the earth to pay

the interest for this year. Or suppose, Queen Isabella of Spain, when she pawned her jewels to purchase the three caravels with which Columbus set out on his voyage of discovery, had invested their value (estimated at \$35,000) at 5 per cent. compounded yearly, the "just return" for the use of her capital would be a sum more than equal to the amount realized from a sale of this entire continent estimating it at \$100 per acre, and the wealth of all that is on it also, would not pay the interest for this one year. The unjustness of this "just return" theory must be evident, and certainly affords no ethical or economic grounds for the payment of interest.

The question still remains: "What is interest and how does it arise?" To the solution of this problem let us now apply ourselves.

Wealth is the product of labor applied to natural objects. To say, as single taxers do, that wealth is the product of land, labor and capital, is like saying—to use one of George's felicitous illustrations—that mankind consists of men, women and human beings. Capital is *not* an independent factor in production, but is itself the product of labor. Wealth is therefore the product exclusively of labor applied to land. Land itself is not wealth, neither is money, bonds, stocks, or mortgages; they merely represent wealth or an evidence of the claim to the ownership of wealth. In brief, nothing that is not the product of labor is—in an economic sense—wealth. How is the wealth that labor creates distributed? Under slavery the master appropriated the wealth produced by his slaves, allowing them only a subsistence. Here the robbery of labor was open and undisguised. Under the feudal system the serf retained inalienable rights to the soil from which he derived his subsistence; giving in return to the lord of the manor, certain services in labor and personal attendance. But upon the adoption of standing armies, supported by taxation, the feudal lords gradually assumed the absolute ownership of the land; and the relation gradually changed from that of master and serf, to that of landlord and tenant, and payment for the use of land assumed the form of rent, instead of labor and personal services. Then for the first time appeared the landless man—the proletarian.

Upon the invention of the steam-engine and its application to the running of machinery, great economic changes resulted. The factory system arose. The factory with its thousands of spindles and thousands of operatives under one master entirely superseded the hand loom; and the workers unable to compete with this method of production—the profits of which inured to the factory owner—gradually sank to the condition of "wage slavery," forced to work for a bare subsistence; hunger a good substitute for the lash.

This is our present system of "free contract" and *Laissez faire*. On the one hand we see a small proportion of the population who control all the means and instruments for the production of wealth, on the other, the large body of producers who have nothing but their labor to sell, and who are compelled in desperate competition with their fellows to sell it quickly, or starve.

Under such conditions the cost of the production of wealth is

merely the cost of the subsistence of the laborer governed by the standard of living for that time and country. All over that amount goes as interest—which is the “surplus value” of the economists—to the owners of land and capital. Under the operation of an “iron law,” wages continually tend to the minimum upon which the laborer will consent to reproduce. With every new invention of labor-saving machinery, all discoveries in the arts and sciences, all improvements in government, all increase in skill and technical knowledge, tend to increase the production of wealth. But the distribution of this wealth constantly tends to greater inequality; while the absolute amount given to labor may somewhat increase, the relative amount—compared with the surplus value which labor, and labor alone produces—is constantly decreasing.

“Surplus value” includes rent of land, rent of money (interest), and profits. Interest on money is the premium the exploiter is willing to pay for the ability to exploit labor. Interest, or “surplus value” therefore, is nothing else than a forced contribution from helpless or ignorant people; a tribute, not a tax, enforced by a favored class who are able not only to live without working, but to control and even limit the labor of the majority.

I lay it down as a fundamental postulate; that in a world where wealth can be produced only by labor, those who possess it, not as the result of their own labor, but as the ‘surplus’ value of the labor of others, are robbers and parasites, who could not exist under just social and economic conditions. Property so acquired would justify Proudhon's famous dictum: “*Le propriété c'est vol*,”—property is robbery.

All rent therefore, whether of land or capital is robbery of the products of labor. For it is self-evident that unless labor produced more than its subsistence there would be no fund from which interest could be drawn. The ability to exploit labor is the result of the private ownership of the means of production, viz: Land and capital.

This system of exploitation is the “wage system,” which, under the pretense of free contract, forces the producers of wealth to sell their labor—under the pangs of hunger—to the capitalist for part of the product, while the remainder—the largest portion—goes to the capitalist as profit without any exertion on his part. Interest is therefore the product of other people's labor, obtained by exploiting the necessitous condition of the laborer. It is ethically indefensible.

In reply to my article showing the insecurity of land and improvements that would obtain under a tax that would vary so greatly with increase of population, Mr. Middleton replies, that he “always supposed that Mr. George and single taxers generally taught that the effect of the single tax would be to raise the margin of cultivation and diminish rent of improved lands.” This is true only with regard to agricultural land. There is nothing in *Progress and Poverty* that would indicate that George expected any diminution in the rental value of urban land, but—as Sairey Gamp would say—on the contrary quite the reverse. To get over the difficulty of the insecurity

ity of tenure of land and improvements, which Mr. Middleton does not deny would occur, and the incident loss that would accrue to the owner of the improvements, Mr. Middleton informs us that the owner would not be dispossessed without compensation.

Now this is a clumsy method of tiding over a difficulty that George never thought of when he wrote *Progress and Poverty*, and is directly at variance with the whole teaching of that book. For it is claimed as a special virtue of the single tax that it would force owners of land to put it to the best and most productive use. The single tax would be as George informs us "virtually putting up land to the highest bidder." Land is to be taxed *irrespective* of improvements. Indeed "single taxers generally" are fond of dilating upon the fact that the enforcement of the single tax will force owners to pull down unsuitable buildings or abandon them. In fact the rental value of the land will increase quite regardless of the income desired from the improvement. Where does Mr. Middleton get his authority for the statement that: "While any person failing to pay his taxes would, as now, find his land advertised for sale, yet, contrary to the present custom the advertisement would provide that the purchaser must compensate the delinquent for his improvements." Does Mr. Middleton mean to assert that the owner of, say a tannery or planing mill, the site of which the growth of the town had made valuable for hotels or stores, could refuse to pay the increased tax, or any tax for that matter until the party who desired the site for a hotel, paid him the full value of his improvements?

This would indeed be a delightful state of affairs, for the tannery chap. This would knock out my insecurity theory completely. All one would require to do when building in a growing town, would be, to make the improvements as large and architecturally as hideous as possible and then regard with philosophic equanimity both the increase in population and the rent. Really I am afraid that a naturally kind and justice loving disposition and a somewhat exuberant fancy will cause friend Middleton to play sad havoc with the teachings of the prophet of San Francisco. I am somewhat amused at the statement, "that the more wealth is increased the greater the amount to be divided \* \* \* greater are wages or the share that labor gets." As labor produces all wealth why should it have to "divide" or "share" the product at all. At the proper time I hope he will explain this, and also how the single tax will increase wages. In this discussion we want facts, not mere assertions. My next paper will give him the opportunity to answer.

To conclude, Mr. Middleton virtually concedes my claim that the single tax would destroy security of tenure of improvements, but with the cheerfulness of a Mark Tapley hopes that "in some way" our friend Smith the mechanic would not be despoiled of his home, and winds up with the confident assertion that: "So far from having shown the fallacy of the single tax regarding the tenure of land and improvements, you have but called attention to one of its greatest virtues." (?)

## QUEEN ANNE'S LACE.

BY ELIZABETH MORGAN.

"And you have never been up in the garret?" asked Jim.

"No," said Queen Anne, tranquilly, "how should I? It's fastened, no one has been up there since the war time. The Northern soldiers were coming and the family had to go farther back in the country, so of course they took everything with them they possibly could, and fastened up the house from garret to cellar. We have been told they buried the silver somewhere about the place, but we don't know where, so it's no use to look for it."

"There might be something worth finding in the garret," suggested Jim.

"There would be dust, and spiders, and cobwebs," said Queen Anne, "and perhaps the ghost—my father prefers to keep that door shut."

"A ghost!" said Jim.

But Queen Anne looked at him seriously. "Don't you have ghosts at the North?" she asked. "We certainly have one here."

"Tell me about it," asked Jim.

They were sitting on the piazza steps of an old Southern house. Before them stretched a narrow strip of rough, wind-blown grass, that ended suddenly in a steep little decline to the sandy beach below, and then the sea, and the sunset.

"It's not a very ancient ghost," Queen Anne said, looking off toward the sea, "it began with the war, like many things in this country. An uncle of my father's owned this plantation then. It was much larger than it is now, and they had crowds of negroes. My aunt was young and beautiful and her gowns and jewels were the envy of all the ladies in Newport, for they always went there to spend their summers. But she was fond of lace above everything, and had the most exquisite collection in the country. I am as fond of it as she was, only unfortunately this is the only sort I have to decorate myself with," said Queen Anne with a sigh, pointing to a bunch of feathery, white blossoms, that she wore in the front of her dress. "They are called Queen Anne's lace you know, that's why I took a fancy to wear them."

"Were they named for you or you for them," asked Jim.

"I don't know who named them," she answered, "I was called Queen Anne when I was a baby. Everybody has a pet name in the South; I suppose of course, with you it is different—but I was telling you about my aunt. She had two sons when the war began, handsome and brave and full of patriotism, and they enlisted at once to fight for the cause. Their mother was heart-broken, but she gave them her blessing and let them go. Of course I cannot expect you to sympathize with the lost cause, or the heroes who fought to save it, but I know you will pity their mother's sorrow—for her boys never came back."

"That was rough on her," observed Jim, as Queen Anne paused. "Rough!" said Queen Anne. She thought the same word might be applied to Jim's manner of expressing himself at times. She drew a bit of her "lace" from her buttonhole and played with it as she continued.

"The boys were devotedly fond of their mother, and it was their custom to celebrate her birthday with great rejoicings. Wherever they might be, they always came home for that day."

"Hadn't she any other children?" asked Jim.

"She had only those two sons, and that year they had promised to be with her as usual, but before the day came there was a battle and she heard that one had been taken prisoner. Of the other she could get no news, so, as there was no certainty, she clung to the hope that he was safe, and insisted that they would both be with her when her birthday came. She had all put in readiness for them and watched and waited. Every night she wandered over the house with her light, for how could she know from which direction they would come, and there must be a welcoming ray to guide them safely home. So day after day went by, and night after night. It was supposed one had been killed in the battle I told you of, and the other, who was taken prisoner, was shot when trying to make his escape, that he might keep his promise to his mother. But my aunt would never believe they were dead, and she watched for them, with her light, till the Northerners came down, and she left her home to the enemy's possession. And so ever since, they say, on the night of the 10th of August, which was Madam Leyton's birthday, a light flickers from the windows of the old house, first on one side and then on the other. The fishermen see it in their boats on the water, and belated travelers on the road over there, have seen it again and again."

"How about the people in the house?" asked Jim. "Do they see her too?"

"Yes," said Queen Anne, "indeed they have. Why should you look incredulous? I am telling you a *true* story, on the word of members of my family whom it is impossible to doubt! She never comes except on her birthday, unless some danger or sorrow threatens us, then she is sure to be seen with her white dress and beautiful pale face, gliding from room to room, with her candle in her hand!"

"I should never dream of doubting your story!" said Jim, hastily, for Queen Anne was regarding him with eyes that indicated some displeasure. "But it does not explain why you have never had the garret door opened."

"I explained that," said Queen Anne, "when I told you that my father likes better to keep it as it is. I have always connected that mysterious closed door with the ghost, in my mind."

Queen Anne paused. The tide was coming in, softly splashing against the shore, purple shadows were stealing over the land and sea.

"You have made me frightfully nervous," said Jim, suddenly jumping up from his lower seat to take the one beside her, "I sha'n't dare to sleep in the house to-night!"

L F M 4 May 98

Queen Anne drew away from him instantly, straightening her slender figure with much dignity.

"You are laughing at me," she said, "you think I am foolish to believe such things!"

"No, I am not," Jim protested, "I was only thinking that ghosts were dismal company for you all by yourself here."

"I have papa," said Queen Anne, loyally, "but of course he has his books and his studies, and they don't leave him much time for me. I was always alone till you came," dropping her voice with a little sigh.

"Poor little girl," said Jim.

"If you are sorry, why do you go away?" she asked. "When you first came, you said that bridge would be a long piece of work."

"It's a very well made bridge, your majesty," said Jim. "Carefully constructed and strongly put together. It will last I should say, making a rough guess, about as long as the river."

"Then you'll never need to make another?" said Queen Anne.

"That was want of foresight on my part," said Jim. "I see it, now that the bridge is done, and I am undone. But after all, there is no law to prevent my visiting this part of the country again, if only you'll be kind to me, Queen Anne."

"I was never intentionally unkind to anybody in my life," said she, rising.

Jim sprang up also and caught her hand, "Miss Leyton, do you like me well enough to wish me to come again?"

"You seem to require a great many assurances," said Queen Anne with a dignified but ineffectual effort to withdraw her hand. "Papa has invited you over and over, and so have I—I think papa is calling me, Mr. Roslyn!"

"He is not," said Jim, "beg your pardon for flat contradiction, but—I love you so much it would take a lifetime to tell you of it, and you won't give me five minutes."

Queen Anne turned her face away until only a small tip of her ear was visible.

"Why do you like me?" she asked.

"I don't like you, I love you! Because you are the prettiest, sweetest, dearest girl, I ever saw—because you are yourself—because I can't help it!" said Jim definitely and conclusively.

"You would not care about me if you knew I was mercenary."

"You are not."

"I am. Are you enormously rich?"

"I have enough that we could be very comfortable, and I can make more," said Jim, dismissing that point as disposed of, and bending his head low to look into her eyes. "Do you love me, Queen Anne?"

"It's no use, you haven't money enough, I told you before."

The purple shadows had deepened and darkened, belated fishing boats crept noiselessly past, their tall white sails showing ghostlike through the gloom. The waves were louder on the shore as the evening wind freshened and grew stronger. It rustled through the

low shrubs on the bank, and whispered through the long rough grass.

"Good night," said Queen Anne, softly, "I know you will despise and hate me now."

"I am waiting for my answer," said Jim.

"Your answer? But you have it—you must not think of me any more."

Queen Anne was gone, and before he could follow, her father had appeared in her place. A white-haired old gentleman, ceremonious and dignified to what Jim considered a painful degree.

"Will you not give me the pleasure of your company this evening, Mr. Roslyn?" he asked, and ruefully Jim followed him into his study, but while he sat, an apparently respectful and patient listener, his thoughts were far from the subject in question, till he was suddenly and unpleasantly recalled.

"So that matter has been an established point from the first," Mr. Leyton was saying in conclusion and apropos of what Jim had not the smallest idea. "My daughter understands how much depends on her, and is fully prepared to do her duty," and then Jim wished he had given more attention to the foregoing remarks. "Pardon me," Mr. Leyton resumed, after a slight pause, "for entering at such length upon matters which could not be expected to interest a comparative stranger. My only excuse lies in the fact that living so remote and solitary a life, I get at times an almost morbid desire for companionship and human sympathy."

Jim muttered something about being glad to accommodate him with these articles, but the old gentleman paid no attention. "It is useless to deny that the family fortunes are at a very low ebb," he went on, "and quite out of the question that I, with my temperament and education, could do anything to advance them. It lies with my daughter."

"What's she going to do?" asked Jim.

"Her duty, as I have already explained to you," replied her father pompously.

"I don't think I quite understood the direction it was going to take," he ventured to suggest, but the old gentleman had passed on to generalities.

"Sacrifice is a beautiful thing, for those we love," he murmured. "I cannot take more of your time now, Mr. Roslyn. Pardon my egotism and forget my confidences. Good night."

And Jim, finding himself thus dismissed, retired to his room, in a highly excited state of mind. What could the old gentleman have told him that he did not hear? How was Queen Anne to be sacrificed? Probably to some repulsive creature with money—there was nothing else that could be done with her to help "the family fortunes," that he could think of. The family fortunes! There was no one but herself and her father, that Jim had ever heard of, and his blood boiled as he tramped up and down his room, contemplating this picture of parental selfishness.

The night wind blew in at the windows, waving the long white

curtains wildly. The candles flickered and flared in the draught, till a sudden stronger gust put them out entirely, and then finding himself in the dark, Jim threw himself down on the sofa and was still.

He was very sure he did not go to sleep. He could have told every miserable thought that passed through his brain, but the great clock in the hall was striking twelve when he started up. Some one was in the room with a light.

"Queen Anne!" he said.

Swiftly and noiselessly the lady crossed the room, her long white dress trailing after her, and placed the candle she carried on a small table before the windows. She did not notice Jim, or seem aware of his presence, but stood looking anxiously out into the night. Then, suddenly taking up her candle, she passed out again, as swiftly and silently as she had come. Without knowing why, Jim sprang up and followed her.

The wind was blowing through the wide hall in a blast that told the front door had been left open, but the candle in the lady's hand burned steadily clear and bright. On she went, down the hall till she came to Queen Anne's door; there she paused for an instant, with a gesture of despair, then went on again quickly to the end of the hall and stopped at the garret door. Jim knew it by the bars that were nailed across.

The lady seemed unconscious of the bars as she tried to raise the latch and struggled vainly to open the door, wringing her hands when her efforts were unsuccessful, and then desperately trying again.

Instinctively, Jim came forward to her assistance, but only to find himself suddenly in the dark. The lady and her candle were gone. He put out his hand and touched the garret door with its bars across. Down at the other end of the hall, a ghostly moonbeam was shining in at the window and the wind swept past him with a sound like a trailing garment.

"Walking in my sleep!" said Jim. "This comes of listening to ghost stories, and a combination of annoyances generally!"

But he felt no inclination to remain longer in the vicinity of the garret door, and made his way back to his room with as much speed as the darkness would permit.

He went to his work next morning without seeing any of the family. That night, instead of going back as soon as his duties would permit, he went for a sail.

He had made up his mind to give up his room at Mr. Leyton's next day on the pretense of getting nearer to his work. They had taken him in the first place because of Mr. Leyton's friendship for his father. He surely could refuse to trespass on their kindness any longer. It was impossible for him to stay, and yet—if any danger threatened Queen Anne!

The boat was steering in shore by this time, the stiff evening breeze filling her sails till she tipped down to the water's edge. He could see Queen Anne on the piazza watching him, and the boat

flew all the faster at the sight. When he reached the shore, his little hostess came down to meet him.

She was wearing some of her white flowers as usual, the delicate lacework showing over her pale blue dress to great advantage, but Jim regarded her decorations gloomily and greeted her with some stiffness of manner. Then he proceeded at once to tell her of the necessity for his change of abode—with haste as if he feared his resolution might waver.

"I couldn't go on staying here, you know," he concluded as Queen Anne only looked at him sorrowfully without speaking. "You have every right to sell yourself for money if such is your desire, but you can hardly expect me to stay and assist at the bargain."

"I don't understand you," she said, opening her soft eyes at him wonderingly.

"Oh, it doesn't matter," he went on hastily. "But, you see, I'll have to go—I couldn't be civil if I stayed on, and it's not for long now. You can set down my sudden departure, if you please, to the fact that I saw your ghost last night."

"The ghost!"

"I suppose I was dreaming, but she looked as you described her, and came into my room with a candle."

"It was not her birthday," said Queen Anne, under her breath, every vestige of color leaving her cheeks.

"She wants the garret door opened," said Jim. "I followed her, and she was trying to unfasten it. The bars were too strong for her, and I offered to help, but she disappeared."

"Are you laughing at me?" asked Queen Anne.

"I am telling my dream, which is bad manners, by the way, but you have become accustomed to my lack of refinement, long before this."

"I wish I knew whom the danger threatens," Queen Anne murmured to herself. "If it is for me, I understand."

"Then surely you can protect yourself!" said Jim, but she shook her head.

"No, I can not." Then dropping the subject for the other point in question, "You won't go away to-night, will you?"

"What's the use of my staying? You tell me that danger threatens you, and your father says you are to be sacrificed, but neither of you tell me how, nor what, nor when, and you refuse to let me protect you."

"How could you protect me?" she asked.

"Give me leave and I'll show you," replied Jim with animation, and Queen Anne turned away her face and answered hastily.

"I suppose first of all you would open the garret door!"

"Not unless you wished me to," said Jim. "I have nothing to say on that point, but if you really have confidence in your ghost, that is clearly what she thinks had better be done."

They were a silent party at dinner that night. Queen Anne looked pale and worried and her father as usual was absorbed in his own solemn reflections. He retired to his study as soon as the re-

past was over, and the young people, thus left to their own devices, returned to the piazza, but instead of seating themselves as usual for a quiet talk, Queen Anne stood leaning against the balustrade looking absently at the sea, while Jim strolled up and down in an unsettled way. He did not think he had been kindly treated by any means. It was unfair to tell any one so much and yet so little. He made no attempt at conversation, but as he passed Queen Anne she turned to him suddenly.

"Do you suppose we could open that garret door without papa's hearing?" she asked.

"I am sure of it," he answered. "Particularly when he is off in his study."

Queen Anne was silent for another minute, and then she turned again to Jim with a look of desperate resolution.

"Will you open it for me?"

"I will do anything for you," said Jim somewhat rashly.

"Then, come now," she said.

Noiselessly the two conspirators crept upstairs, Jim to his room for the necessary tools, and Queen Anne to hers for a candle. She was waiting for him by the garret door, when he came out. It gave him a shock to see how like she was to the lady who had first led him there, but without any comment he went to work.

"It makes a dreadful noise," whispered Queen Anne after she had watched him for a few minutes, "I'm afraid he'll hear."

"He won't," said Jim. "I'll leave these bars so we can put them back again, and nobody need ever know they've been off."

"Oh, dear," sighed Queen Anne. She set down her candle and went to the stairs, leaning over the balustrade to listen. The waves fell on the beach below like the sound of a footstep, and a flash of lightning shot across the open hall door. There was a roll of distant thunder as she went back to Jim's side. He was just removing the first bar.

"There's a shower coming," she said.

"It will help to cover the noise I make," said Jim. "These nails are driven as though they meant them to stay."

A brighter flash, a louder peal, warned Queen Anne that her windows had better be closed, and she hurried away again.

When she came back the last bar was removed and Jim was waiting for her with his hand on the latch.

Queen Anne shrank back as he opened the door.

"I am afraid," she said, "I feel as if I was doing something dreadfully wicked. Just listen to the thunder! You will come with me, won't you?"

"To the end of the world," replied Jim, catching up the candle as together they ascended the dusty stairs.

Cobwebs brushed against their faces, and the air was musty and close. The rays of the candle penetrated the thick blackness but faintly as they flickered and fell in the draft; tall, dark shadows in the corners bowed and beckoned mysteriously.

The squall had struck them with all its fury, and the wind was beating against the old gables, with a noise like the sea.

"There are three big boxes over in that corner," said Jim. "Shall I open them for you?"

But Queen Anne was clinging to his arm like a frightened child.

"It's a dreadful place," she said, "I wish I had never come here. Oh, what is that!" as a bat flew suddenly out of the darkness and circled about the beams above their heads.

"Would you rather wait till to-morrow?" asked Jim.

But Queen Anne clung to his arm the tighter.

"Oh, no, no! I would never dare come here without you!"

"Well, then, suppose you give it up altogether and come down stairs, I'll fasten the door up again and none need know you ever came up here."

But Queen Anne looked at him piteously.

"If there's anything up here, I *must* find it," she said. "You don't understand how much we need the money."

"I don't understand anything about it," said Jim, rather grimly; "I don't think you are treating me fairly, but my ideas and yours can hardly be expected to agree on the subject. Now *you* do not understand—" for Queen Anne's eyes expressed only bewilderment. "Have I not told you that I love you? That counts for nothing with you. It's a more serious matter with me."

A peal of thunder cut short his wrathful words, Queen Anne had dropped his arm and stood trembling.

He strode over to the trunks in the corner and savagely forced up their lids. Then he came back for the candle, and stood holding it while Queen Anne timidly approached to examine their contents.

The first contained only blankets and bed clothes, though she pulled them out one after another to make sure nothing was hidden between. A faint smell of camphor still lingered about them with an odor of ancient dust.

Jim tumbled them all back into the trunk again, and Queen Anne passed on to the next. This was full of table linen, delicate and fine, and the faint smell that rose from this was mingled with lavender and rose leaves. When she came to the bottom of its treasures, Jim flung them back also, with a glance at her despondent face. Her terror of the place seemed to have vanished in her anxiety as to what she might find. The last of the boxes was much more interesting. It evidently held a part of Madam Leyton's wardrobe that she had been unable to take away with her, probably a part in which she had little interest since her sons were gone.

Silks and satins and velvets Queen Anne unpacked, trailing their magnificence over the dusty garret floor, while Jim looked gloomily on at the splendors imperfectly displayed by the flickering light of the candle. Suddenly Queen Anne uttered an exclamation. She had opened a large package that lay at the bottom of the trunk.

"This was *her* lace!" she said.

Ruffles and flounces, shawls and scarfs of every conceivable pat-

tern and width, as fine as cobwebs and delicate as frost-work. At the bottom of all a wedding veil.

"You won't need to wear flowers any more," said Jim; then he swept Madam Leyton's ball dresses together and would have thrust them back into their former seclusion in the same way he had disposed of the blankets, but Queen Anne interrupted him with a little shriek.

"Oh, don't! I want to take every one of them down stairs!" she cried. "You mustn't catch them up in that way! Please stretch your arms out so!—let me lay them across carefully—There! thank you very much. I'll carry the candle."

And Jim went down with his load, wondering that the distress Queen Anne had seemed to be in a short time before should be so soon relieved by the discovery of a trunk full of old clothes!

At the bottom of the stairs they met Mr. Leyton, also carrying a candle, and looking a picture of pompous wrath.

"*May* I ask the meaning of this?" he demanded, a roll of thunder emphasizing his angry tone.

"We've been up in the garret, papa," said Queen Anne, coming forward hastily, Jim being at a disadvantage behind Madam Leyton's finery. "I know we ought not to have opened the door—but, oh, papa, we have found the lace! Such heaps and heaps of it. We'll never be poor any more!"

But Mr. Leyton exhibited none of the joy his daughter seemed to expect. He was visibly displeased at having their circumstances discussed before a comparative stranger.

"We were hardly in straits to make such a course as this necessary," he said. "That is Mr. Roslyn, I presume?"

"Yes," replied Jim indistinctly from behind his shelter.

"Well, then, Mr. Roslyn, I regret to be obliged to inform you that I consider you have taken a great and unwarrantable liberty, and I am at a loss to understand how you will explain yourself."

Jim dropped Madam Leyton's ball dresses in a heap on the floor, and held up his head defiantly.

"I have taken the liberty of loving your daughter!" he said. He did not make this announcement with any idea that either father or daughter would be affected by it. It was simply the excuse for his offence—that was all.

Mr. Leyton looked taken aback for a moment, but he was by no means appeased.

"Indeed," he said sarcastically. "And you, Miss?" turning suddenly on Queen Anne, who had set the candle on its chair again and stood with her arms full of lace, gravely listening, "I reckon you'll tell me next that you've taken the liberty of loving him in return?"

This unexpected attack caught Queen Anne all unawares. She turned first red and then pale, and then with a frightened glance at Jim, and an imploring one at her irate father, her eyes filled with tears, and quickly Jim interfered.

"Your daughter has refused me once, Mr. Leyton," he said. "It's

hardly fair to make me go through that a second time, and publicly."

But Mr. Leyton seemed more angry than before.

"She *refused* you!" he cried. "You *refused* him! The son of the friend of my youth! And after you'd promised—"

"Oh, papa," cried Queen Anne, "I—I'm very sorry."

"Do you mean that?" said Jim, turning upon her in his turn.

And poor Queen Anne, surrounded upon all sides, with only the gruesome garret behind her to flee to, hid her face in her aunt's wedding veil, and murmured, "Yes!"

---

## MR. STUART'S SINGLE TAX FALLACIES.

JAMES MIDDLETON.

---

No. 3.

In his first and second articles, Mr. Stuart undoubtedly raised points which all single taxers ought to concede as vital, the escaping of mortgagees of land values from their share of taxation, and security of tenure for improvements under the single tax.

I have shown conclusively that the single tax justly carried out will amply provide for these very points and vastly better than does our present system; hence his so called fallacies only serve to emphasize the virtues of the system.

In his third article, he takes up the sufficiency of the tax. He says; "To the single tax mind no proposition appears more certain than that the confiscation of economic rent as contemplated by the single tax would produce sufficient revenue to defray all cost of government; national, state and municipal."

If we accept Mr. Stuart's definition of economic rent, I am certain his proposition can apply only to some such minds, certainly not to mine.

Before we can attempt to estimate the sufficiency of economic rent as a fund to tax, we must know what economic rent is.

If that rent only is economic rent which would appear in a perfect state of freedom and if we accept the doctrine which Mr. George himself seems to teach in some places, that only such rent can be used for government purposes, then Mr. Stuart's point is indeed a vital one.

Mr. Stuart, Mr. J. W. Sullivan and some others have lately sought to restrict the meaning of the term, economic rent, to a something

which in the present state of society it is utterly impossible for any one to determine. How can Mr. Stuart or any one tell what even would approximately be the pure economic rent in a perfect state of freedom? It is merely a matter of conjecture or theory as regards either its sufficiency or insufficiency.

The Ricardian theory of rent upon which the single tax is based is correctly stated as far as differences in rent are concerned by Mr. Stuart when he quotes, "Rent of land is determined by the excess of its produce over that which the same application can secure from the least productive land in use." (*Progress and Poverty*, chapter 2, book 3.)

Economists in studying the phenomena of distribution found part of the product went to the owner of the land, part to the capitalist, and part to the worker as such.

These divisions of the product they called rent, profit and wages. Ricardo defined rent as, "that portion of the produce of the earth which is paid to the landlord for the use of the original and indestructible powers of the soil." A well accepted meaning of the term from that time to this has been the market value of the land; and the market value of a piece of land is determined by its excess of productivity over the least productive land in use, or margin of cultivation.

The economists generally failed to analyze fully, the causes which make the margin rise and fall, and the effects upon production and wages of that rise and fall. To Mr. George, more than any other, belongs the honor of riveting the world's attention to that phenomena and their relation to taxation.

Economic rent, in the language of economists, means practically the market rent of the land independent of individual improvements. It is a term broad enough to include that rent which would appear in a perfect state of freedom and the rent that actually appears to-day.

It would be a better use of language to call the ideal rent of a free condition, free or natural rent.

There is nothing to be gained in distorting words from their best accepted meanings in an economic discussion. In my discussion, as far as possible, I shall endeavor to use words in their accepted meanings, and shall use the term free, or natural rent, in place of Mr. Stuart's forced meaning of the word, economic rent.

I will say frankly that I do not know whether free or natural rent would be sufficient for purposes of government or not, and neither do I care, as I believe other objects may be taxed if the welfare of the people demands it.

If I agreed with Mr. George's dictum, that "Private property in land is robbery," and that other dictum, that "A man has an absolute right to all he produces, as against the whole world," I might be anxious.

I agree with the earlier single taxers, the Physiocrats of France, when they strenuously maintain the right of private property in land, as the basis of human freedom.

I agree with Locke, that I have a right to all I can produce or use,

whether products or land, limited only by the rights of my fellow men, and I believe in introducing a tax upon present land values and franchises limited to the needs of government economically administered, and, if sufficient, that alone, because I believe it is in perfect harmony with those rights.

I say if sufficient, because I believe, if need should arise and the welfare of the people should demand, in time of war, for instance, or of famine, or of pestilence, the people may demand the sacrifice, not of property alone, but of life itself.

I am not such a stickler for the single tax as I am for a tax on land values, sufficient, if need be to wholly break up speculative holding of vacant lands by the individual.

Speculation in land is the tap root of the great speculative curse of our age. Cut that, and the great tree of speculation and monopoly loses its vitality and withers away.

I am more than pleased to have Mr. Stuart say; "Therefore the adoption of the single tax would make it impossible to hold vacant land out of use, because none could afford to pay the assumed full rental value of land that yielded no income."

That being the case, I cannot see why any of the countless homeless ones, a renter, a mortgager, a boarder, a wanderer, can oppose it except through ignorance or prejudice.

I might rest my case here, but I wish to analyze more closely the question of sufficiency.

One would think from his article that to Mr. Stuart belongs the honor of formulating that charge. He, of course, may have formulated it independent of others, but it certainly existed earlier than "Nov. 14, 1890." Professor Harris, in the July Forum of 1887, gravely argued the fallacy of the single tax on the ground of insufficiency.

Away back in the beginning of the movement, in the time of John Locke two hundred years ago, it was opposed on similar grounds.

It was one Asgill of that time, I think, who called attention to the absurdity of saying that the land would not produce sufficient for the revenues of the king when every material product comes from the land.

But to examine more specifically his argument, he says; "The result would be that all vacant land not needed for immediate use would be abandoned by the owners from inability to pay the tax and would remain without value until increase in business and population justified further improvements. But more than this, with vacant land plentiful and much of it of no present rental value, under the rule that improved land should pay no higher rent than adjacent vacant land, would not all improved land decrease enormously in value?"

While I agree that individuals in many instances would release valuable vacant lands, it does not follow that any one else could occupy them without paying the assessed annual value or tax to the state. That is a point that Mr. Stuart has over looked and some single taxers as well.

Such lands would revert to the state as public property and would

be occupied only on such conditions as the state, town or city should fix.

If that were not true then there might be eventually no such thing as taxation and the state might come to depend on purely voluntary contributions.

Mr. J. W. Sullivan has advocated municipalities purchasing vacant lands so as to regulate rents. Several years before him Arnold Toynbee, of Oxford, had said, "And should not the state attempt in the future to grapple with such questions as housing the laborers?"

Municipalities might be empowered to buy ground and let it for building purposes below the full competition market value. (Humboldt Library No. 129 page 151.)

That which these philanthropists desired would be easily brought about by the single-tax as may be clearly inferred from Mr. Stuart's admissions, admissions which every one who studies clearly the question must make.

So far then from rent being abolished by the single tax it would be regulated by the state.

If the state should decide to keep rents at something like their present rates it would simply hold the valuable vacant lands which came into its possession at something like their present values.

If it did no more than that, consumption freed from all taxation but the rent it now bears, would be cheapened and increased. The demand for consumption would stimulate production and the great army of involuntary idlers would find themselves in demand and set to productive labor.

The vacant lands held by the state for rental purposes would prevent owners of improved lands from raising their rent charges, and at the same time would give ample openings for new enterprises.

With the increase of employment, with the vast army of unemployed set to productive labor, the annual production out of which rent, profit and wages come, would be vastly increased. While the state might and should lower rent charges, the increased use of poorly used lands and the use of now vacant valuable lands would more than make up the difference.

If the present annual value of lands and franchises exceeds by 35 per cent. the needs of government as Thomas G. Shearman has shown (and Mr. Stuart has not even attempted to refute this,) then with this stimulus to production which freedom from all other taxation under the single-tax would give, there need be no fear of ample revenues to the state even though rent charges were lowered.

In regard to the estimates of present land values by Thos. G. Shearman quoted by Mr. Stuart and the estimates of Mr. Gros, they are more than verified by the report of the Congressional committee on the assessment of taxes in the District of Columbia, May 24th, 1892, Hon. Tom. L. Johnson, chairman.

The summing up of that was, in regard to land values, that they were 73 per cent. of the whole wealth value in the city of Washington. I suppose in the country it would be less.

As the estimated values of the United States not including stocks,

bonds, mortgages and paper currency exceeds sixty billion dollars, I should judge that Mr. Gros' estimate of twenty-two billion dollars for land values and franchises very conservative.

Four per cent. of that amount would equal our present revenues, and yet I believe that four per cent. would be sufficient to cause enough valuable land to revert to the people to enable them to control the land market. The state, by fixing the rent charges of its own lands, would not only prevent landlords from raising rents, but would, if found expedient, compel, thereby, a lowering of rents.

Labor, as shown in my previous article, would be the great gainer, as it would be freed from its present taxation, would have no more, or perhaps, less rent to pay and would get a much larger share of the annual product.

Mr. Stuart refers to the operation of the single tax in New York city if it should be introduced. If, as he concedes, it would destroy the holding of lands vacant by individuals, building and other improvements would be stimulated; rents in the congested tenement districts would be lowered; demand for labor would be increased; greater wealth would be produced at better wages.

It is absurd to say that the city could not, under such conditions, collect ample revenues from the lands and franchises of the city. New York would, at the same time, solve the great tenement problem of our cities. Thus Mr. Stuart's fallacy of insufficiency fades into thin air.

---

**FIREMEN** will be interested in the announcement that the time may be near at hand when they can at least lay down the pick. An invention has appeared in Germany which reduces coal to dust, which, being inflammable, is projected into the furnace by a current of air, automatically regulated, and as soon as it is inside it gives forth an intense blaze. Oxygen being introduced by a new contrivance, the dust does not fall to the bottom, but floats in space, and is consumed to the last particle. There is no perceptible smoke and no ashes. The fire can be started or stopped in a moment, and pressure can be maintained at any desired scale, while the wear and tear of furnaces is said to be greatly reduced.

---

**PRUSSIA** has a number of state railroads, and the government, in taking care of the employes, has built for them no less than 22,980 dwellings. There are 458 superior establishments for high class officials, then comes a lot of dwellings for a lower grade of bosses, and finally, about 16,000 huts for the lowest grade of employes, about like "nigger quarters" in the south at a time when an over-ruling Providence made a black man a chattel or a commodity.

# MECHANICAL.

## THE "QUESTION BOX" QUESTIONS.

---

BY THOMAS PRAY, JR.

---

What men want to know is often a repetition of what has been said, but that some one, who has more recently than the statement, become interested in what is to be gone over again, and it may find another one to "fall in."

Density of water is the weight of one cubic foot of water at the point in its temperature when the stated amount of it to be used as a unit, has a greater weight in pounds and ounces than at any other point, hence it is termed its density, or its greatest weight.

The point in its temperature is found to be 39.1 degrees F., and the weight of one cubic foot is found to be, by careful experiments, 62.425 pounds, and it is more often put down as 62.5 pounds, but in careful figures there is a difference as between the fact and the term so much used. How to get at the weight of one cubic foot of water at any temperature is given in one of the numbers of the *MAGAZINE* for 1892, which the writer has not at hand and so cannot refer to, but Professor Rankine's formula was given and the directions for working out.

From the above data, it is easy to get at the weight of any amount of water that is needed, and there is no more usual mistake made than one which can be found in almost any of the books where an intimate knowledge of all these terms is not one of the reviser's accomplishments, and that is the weight of a gallon of water, for this is very often quoted as ten pounds, and this is correct for the old English Imperial gallon, which has in it 277.274 cubic inches, but the United States gallon has only 231 cubic inches, and weighs only 8.334 pounds at its greatest density, or close to that, now if we take the old English gallon and undertake to make our figures by it, we shall not get at the correct thing in amounts, but this incorrect data is still to be found in many of our late books of so called "engineering data," but it is not right.

The weight of a cubic foot of water as given to find the weight of a cubic inch, divide the weight of one cubic foot by 1728 or the number of inches in a cubic foot, and having done this, then multiply any number of inches by the weight of one inch, the weight of one cubic inch will be found to be, at 39.1 F., .036,126 of one pound or .5,773 of an ounce, or 252.596 grains, and in this case it is 7,000 grains to the pound of Avoirdupois weight, and not Troy or Apothecaries weight,

all of which use the same grain, but not the same number of grains to one pound.

The standard temperature at 39.1 F. is not other than by observation, and it was found in experiments that at that particular point the weight of one cubic foot was greater than at any other temperature, and when you read of 4 degrees centigrade, just remember that it is not four degrees, but 3.96 C. the equivalent of 39.1 F. It is not a matter of much consequence, but in cases involving large amounts it would make quite a difference as to which you used, and a greater difference in the results obtained.

Steam as compared to water, or the relative volume of steam, this is an expression from which we refer the volume, or weight, of a certain quantity of steam as steam, to its equal in water, for when we have to use the density of steam it is easy to make our calculations of the relative volume or the specific volume, and one is the reciprocal of the other, when used with the density.

The density of steam is the weight, in fractions of a pound, of one cubic foot of the steam, and, if we want the specific volume, we divide one by the weight of a foot, and the result gives us the number of cubic feet of that steam in one pound Avoirdupois, and this is the specific volume, or number of cubic feet in one pound.

The relative volume is the number of feet of steam at any pressure that is made from one cubic foot of water, and is found by dividing the weight of one cubic foot of water by the density of one foot at the pressure, and in all computations on this subject we use the relative volume in some computations, and the specific in many others.

In reducing the steam used in the action of an engine, we are obliged to use the volume in order to obtain the weight, for in reducing the number of cubic inches of steam used in the cylinder of an engine, we turn it back into water only by volume in inches, to the pounds in a cubic foot, for the volume of steam is in either pounds, or cubic feet, and one or the other term as is wanted is to be had by simply using multiplication or division.

French measures are rarely used in computations of this kind, with us at least, and the terms of conversion are given in one of the very latest numbers of the MAGAZINE.

In all these calculations it is far quicker and easier to use the tables of Logarithms, but so many do not have them, and others think they are difficult to use, that the trouble of these calculations is greatly increased by working them out in the old way, and it is tedious and perplexing to do so, but with a five place table of logs, any one, having a little help at first, will soon be so he or she can drive a crooked calculation into a few figures and do it far quicker than with the long multiplication, and division, and if the "boys" would only tackle the logs, in a fifty cent book, and spend a few evenings at them it would be far easier to show how to figure out such problems, and the same reasoning is applied to either way, and the logarithm is the power of a number that is used for the number itself, and we add to multiply, and subtract these powers instead of dividing the old fashioned way of using so many figures to carry over

and then add up, or subtract; it is possible that it may be introduced into the next lesson or article, as some have a little experience with them and others wish to know.

"What can a man learn evenings?" is the query. Almost anything to which he has a mind to turn his attention, if he will only do it as steadily as some do their saloon visits, and their theatre or other less reputable places. If any one has one hour of close study at night, he or she, if they will, can learn any language in six months, or short-hand, so as to write reasonably fast, and certainly, or he can learn the Algebra so as to run into clear reasoning, and to work clearly examples that he can't now read, or the calculus, so as to understand what is or is not to be done in many of the ways of working out probabilities, or anything else that he tries earnestly to do, and some men have learned in "evenings," that the way of the careless man leads to state's prison or the scaffold, others have seen in time to abandon their way, and try to do better long before they came to that point, but if any young man wants to learn, there is no school on earth to which he can go, that will do him as much good as the habit of reading, writing or figuring what he wants to know, for if he goes at it in an earnest way, he becomes more or less indifferent to the social, the hop, or the ! ! ! !, and he longs for his supper and his book, and he gets into the habit of study, and it is one of the shortest ways to elevate a man's moral character now in existence, it does him solid good, and it makes him worth more to any one who employs him, and if more of the boys would do it, there would be pages less in the MAGAZINE on "managing a husband." Ask Mrs. Harper.

And I guess there would be many a happy woman, who had some education in her girlhood, who would be glad to hush a "young howler," and sit down to show her "boy" how to do some of the things she used to know, and many a now rich man, at his turning point, has been taught in just this way by a dear woman who loved him and would do anything on earth for him, and how many of them were not treated in return as they should be? A man can learn to do almost anything if he will, in ninety-seven cases out of a hundred, and spend his time in a way that is sensible, and far more than is usually done. Ask your wives if it is not so.

---

The Chicago & Western Indiana have ordered four locomotives from Cooke's. The Chicago, Rock Island & Pacific have ordered from Baldwin's six ten-wheel engines and six Forney suburban engines, with three pairs of drivers connected and three pairs of tender wheels. The Baltimore & Ohio have ordered 50 engines from Baldwin's.—*Locomotive Engineering*.

"Science" is generally supposed to be something abstract and beyond the reach or need of every-day men. It is nothing of the kind. Scientific men, so-called, simply explain natural laws so that they can be used daily by persons of ordinary intelligence, who care enough about their business to understand them.—*The Engineer*.

## A VOICE FROM THE MIDDLE AGES.

BY WILFRED P. BORLAND.

It is difficult to believe that any member of a labor organization, in this age of the world, is so short sighted as the following communication to the *Railway Carmen's Journal* would indicate:

I notice a communication on draft gearing. I think that the draft attachments that he speaks of are first-class. It is very seldom that one of them is broken; but at the same time I would not advise that railroad companies adopt the double continuous spindle type of draft gearing, for the reason that it would be injurious to our brotherhood. He states that he has to replace 200 draft timbers per month and an average of about 250 lug castings per month, besides all the center sills that were broken, owing to the present style of draft gearing that is commonly used in freight cars in present use. In the first place, if the cars were equipped with the double spindle draft gearing, how many less car repairers would his company have to employ to keep their cars in service? I think that if the company only needed carmen to inspect the cars and fix up a hot box that they could get along with about 90 per cent. less carmen, and that would be very injurious to all our brother carmen; besides our brotherhood would have to disband. There would not be carmen enough employed to support the organization. I would suggest that if any brother carman can suggest any device to be used on freight cars that will lessen the danger to life and limb of the switchmen and trainmen, do so, and work hard to get it in use, for that is the one great point that is needed to be studied up and looked after, and not something that is going to injure your brother carman to throw him out of employment. \* \* \* \* I do not think that any carman ought to suggest any device to be used around or about cars that is liable to be the means of one carman to be thrown out of employment.

The draft rigging which this correspondent refers to is the American continuous draft rigging. The *Railway Age* comments upon this curious communication as follows:

It is difficult to believe that the writer of such an article can be in earnest. One is almost tempted to believe it to be a deliberate and wily indorsement of the continuous draft rigging. But it is apparently written in good faith and is interesting reading.

It is indeed interesting reading, and furnishes an excellent illustration of the exceedingly narrow and selfish views, which some persons take of the aims and objects of labor organizations. It is the old spirit which caused the destruction of machinery in the English manufacturing districts, in the beginning of the century, revived. It is such persons as this correspondent who constitute a drag upon labor organizations and prevent them from fulfilling their true mission. This idea that work is something which should be sought for its own sake and without regard to its results is one of the exploded fallacies which workingmen should get rid of as soon as possible. The man who imagines it to be the mission of a labor organization to set its face against improvements as a means of benefiting its members, has an exceedingly faint conception of the true spirit of the labor movement. It is to be hoped that those who hold to the views expressed by this correspondent are in a vast majority in the carmen's organization.

L F M 5 May 98

One of the interesting exhibits at the World's Fair will be a locomotive constructed after designs furnished by the engineers of the Erie railway. The locomotive, which is now being constructed, will be free from hobbies and will represent the best ideas of practical men who are in a position to know the actual needs of the service; it will be paid for by the engineers of the Erie, who have already subscribed for 1,500 shares of stock at \$5 per share. It is said that the different manufacturers of locomotive appliances have generously donated the different appliances selected for the locomotive, which will reduce the cost of its construction very materially. It is to be hoped the engineers will be able to advance some valuable ideas in locomotive designing.

Another interesting locomotive which will be exhibited at the Fair is one which has been designed and built by Mr. Henry Gase, of Gloversville, N. Y. Mr. Gase has spent the spare time of fifteen years in designing and constructing this locomotive, and it is said to be the smallest locomotive ever built to run by steam. The dimensions of this miniature locomotive, as published in the *Railway Age*, are as follows:

Weight 1.5 pounds, with tender 2 pounds 2.5 ounces; length 8.5 inches, with tender 12 inches; height 3.5 inches; gauge of track  $1\frac{3}{8}$  inches; diameter of cylinder  $\frac{5}{8}$  of an inch; stroke of piston .5 inch; stroke of valve  $\frac{1}{8}$  of an inch; diameter of drive wheels  $1\frac{3}{8}$  inches; and diameter of truck wheel .5 inch. It will run upon a circular track 10 feet in diameter. The materials used in its construction are gold, silver, steel and brass, and there are 2,836 pieces.

The latest invention for insuring the smokeless combustion of coal comes from Germany, and consists in reducing the coal to a fine powder and feeding it to the furnace with an air blast. It is said that the fires can be regulated the same as when oil is used and can be started or extinguished at pleasure. Many large concerns in Germany are adopting the system, but I don't believe it would work well on a hog.

Here is an offer, which appeared in the March number of *Locomotive Engineering*, that should be taken advantage of by the several lodges which are interested: "We are requested to intimate for the benefit of clubrooms having models for educational purposes, that the Leach Sanding Device Co., 55 Oliver street, Boston, will supply working models of their device to any parties interested."

---

The deepest well in Europe is an experimental boring made at Schladebach, Germany in the prosecution of some geological researches. This boring has reached a depth of 5,717 ft., over a mile, but the results so far obtained have not been important.

The best trains of the Great Northern of Ireland are lighted by electricity; there are four incandescent lights in each compartment. A storage battery is used.—*Locomotive Engineering*.

## PRACTICAL TALKS TO YOUNG ENGINEERS.

BY L. B. MOORE.

No. 4.

The practice of heavy firing is a habit into which many firemen fall thoughtlessly. I assume this because there is a tendency to ignore the varying conditions and circumstances incident to pulling heavy and light trains.

The work of such firemen is done mechanically, and without the proper exercise of judgment; it being easier to fire a half dozen scoops of coal into the firebox at a time, than it is to consider the principles of combustion or the necessity for such a course. I only speak of a certain class which, fortunately, is small, who, though probably conscientious in their intention to do well, do not *think*.

Where a fireman can show what he is made of, to the best advantage, is on a slow run with a light train. In order to keep the required amount of steam combustion must be as nearly perfect as possible; the draft is light and won't burn the coal if fired too heavy, but if the fire is light, the air is admitted in proper quantities, through the grates, and good results must follow. If you, young men, would instruct your firemen to fire all trains in the same relative proportion, see that they do it, even though you should take the scoop yourselves to demonstrate its practicability. The fuel problem would then be solved until future inventions shall make it possible to practice still greater economy, provided *you do your part of the work as economically as possible, in relation to the time you are supposed to make*. It being assumed, at the same time, that the draft is such as to burn an even fire and the coal properly broken. For, the finer the coal the better will be its combustion in a given length of time; resulting, of course, in more rapid generation of steam; the coarser the coal the heavier must be the fire to prevent the unequal admission of air to the firebox.

You have noticed how easily an engine steams when leaving a terminal: The fire is clean and bright, and when the firebox door is opened the light is so intense as to blind you; sufficient air is being admitted through the grates, at the proper temperature to release the gases in the coal and consume them; combustion is, therefore, as nearly perfect as we can make it. Now why can not this condition be maintained during the entire run? If it could, there would be no question but a large percentage of fuel would be saved. Circumstances doubtless have much to do with the fact that this condition is not maintained, but the engineer and fireman have more to do with it.

Now here is a road, we will say where Ohio coal is burned; this coal is uniformly clean, and being broken to the desired size before it is put into the chutes, every chance is given for the practice of economy.

But how differently these chances are appreciated by different

men. A great many make the most of the chances and practice an intelligent economy; others are careless, not appreciating the value of small things, while others follow a rule something like this: Put a scoop full of coal into each corner of the firebox, watch the indicator, if the result is not satisfactory at once give her another dose, before the first has been given a chance to burn; then the shaker is resorted to, watching the stack meanwhile for black smoke, the lack of which indicates a hole in the fire. There is a visible improvement in the steam after these operations have been gone through with, and the fireman thinks the fire was dirty; but the whole trouble is the result of following a rule. Confound these rules! They destroy our self-reliance, it being more convenient to utilize the theories of others than to analyze conditions and reason out methods for ourselves.

It is said that every rule has its exception, and I am inclined to think that with many of the rules, which are laid down for the guidance of enginemen, the exceptions predominate.

Another cause of heavy firing is the anxiety of the fireman to keep steam up to the popping point; his engineer insisting on being furnished with the maximum when he well knows that many times in the course of the trip a reduction would have done the work as well, besides giving the boy with the scoop a chance.

It would be well for you who have just been promoted to put your firemen at their ease in this respect; give them to understand that a fluctuation in the pressure will make no difference at times; it will have a tendency to prevent crowding the fire. With a poor steamer, or when leaky flues or steam-pipes make it difficult to keep the supply up to the demand, you are put in a position where you can show your judgment by economizing in energy; you have none to spare.

Got a meeting point to make, with a scheduled train, down the road somewhere; getting anxious now with a tendency to increase the speed. This won't do, the supply won't admit of it. The fireman takes in the situation and becomes as anxious as you are; he is your main support now; he knows it, and tries to be equal to the emergency. You are both placed, relatively, in the same position, with a tendency to crowd the capacity of the engine. Don't do it! Reserve your energy until nearing the meeting point, even though you may be compelled to run out a flag to protect your train. If you become "rattled," you will probably run out of steam and water just when you need them the worst; and your fireman will become disgusted after his fruitless attempts to furnish you with steam which you don't know how to use. Here is a case where you are compelled to work under discouraging circumstances; all that is necessary is a cool head to think and act; the principle of economy is also involved; if you waste energy, you waste coal; and this same principle, if not the measure of your success, at least determines your standing as a valuable man. What you save, you earn above your wages. When we consider that, under the most favorable circumstances, 95 per cent. of the energy in a pound of coal is wasted, we are constrained to speculate on the unnecessary waste of the other 5 per cent.

## GREATER SAFETY FOR EMPLOYES.

BY WILLIAM WEILER.

The so-called "Car Coupler" bill has passed congress and has become a law. Its scope is really much broader than its name would seem to indicate, for it not only compels the adoption of a coupler which can be coupled and uncoupled without going in between the cars, but it also has sections which provide that locomotives must be equipped with driver brakes and the necessary appliances for operating a continuous brake on the train, so that the engineer can control the trains without the aid of hand-brakes.

Another section of the law deals with hand holds or rails at the end of the cars, compelling their general use. Most companies have made some attempt at this, but those that have not will now be forced to use them.

A standard height is also to be fixed for the drawbars, for the most prolific source of danger in coupling is the unequal height of the drawbars which often over ride each other and allow the end sills of the cars to squeeze the life out of the unfortunate victims of a systematic neglect, for a standard has been adopted over twenty years ago, only to be entirely ignored by many of the companies, or rather of their officers, for in many instances the matter has been left to the car builder, who uses his own sweet will about the matter, thus putting lives and limbs into jeopardy, which it should be his aim to protect to the best of his ability.

While the law encountered some opposition its provisions appeared so just that our senators and representatives gave it a fair majority, and as the corporations are ever ready to advise their employes to be law-abiding, it is hoped that they will set an example in this matter. No fair minded railroad management will refuse to comply with the provisions of this law, for the exigencies of the times demand driver and train brakes to control the ever increasing number of trains rushing over the tracks at an ever accelerating rate of speed. The loss of much valuable time lost in making couplings is also no small factor in railway practice, for a few minutes lost in this manner often means a wreck and the loss of thousands of dollars. From an economic point alone any progressive railroad manager will find that these improvements will pay, without taking into account the lives and limbs of its employes, for which they are to be held accountable if they fail to comply with the law.

It appears that a recent discussion of the New York Railroad club was right in line with the ideas expressed in the April MAGAZINE, that we were checking up the draft passages by too many obstructions. The assertion was made that locomotives had been run by several parties present, that had no spark arrester device at all and that they gave good satisfaction. If this be the case why could it

not become universal practice? In the netting in use with the diamond stack, hardly one-fourth of the space is left for the passage of the exhaust with its air or gases and as a consequence it must rush through these spaces at four times the velocity that it would if it had the whole of the area of the netting. It would seem reasonable to believe that if the air was admitted to the fire more freely by wide spaces between the grates, that if the nozzles were then enlarged, and the stacks cleared of all obstructions we might have a locomotive "easy on her fire," yet using up the fuel to the best advantage and reducing the spark nuisance to a minimum. It may not be possible to entirely overcome it, for even the best arrangement out allows many of the sparks to escape. There is not a great deal of difference in the number of sparks thrown by a diamond or a straight stack, but the adherents of the straight stack say it is best "because the sparks go up so high that they cool off and become harmless before they again reach the ground." If it should be possible to do away with the sharp exhaust, railroading would lose some of its charms, for it seems that the trained ear is ever on the alert to catch the music of its rhythms, but we would have to solace ourselves with the reflection that the fireboy is having a better time than he ever had and that the company is saving money by it, with which to pay us better wages.

---

A dirty smoky chimney may be cleaned in a very easy manner by putting a small handful of sand into it, then holding one end closed with one hand filling it nearly full of water and giving it a few shakes and then rinsing out with clean water. By rubbing the outside with your hand to which some of the sand naturally adheres you will also be able to give the outside the same polish. Having invented and practiced this method over ten years, I can say that there is nothing else that equals it for cleaning chimneys. It ought to be done several hours before you intend to light up so as to be sure to have the water drained off and the chimney restored to its natural temperature, for if it is not, the sudden and unequal expansion of the parts nearest the flame will cause it to crack.

---

#### DEFINITIONS.

MR. EDITOR:—I have noted, with much interest, the various definitions which have been given by contributors, in answer to the question, "What is an eccentric?"

Mr. Knapp says, "It is a circle within a circle, or any round or oblong circle with a round center, to which it is fastened."

I did not know that circles were divided into classes, as to shape. In an article on eccentrics, in January MAGAZINE, some one gave

good definitions; but again, in the March issue, Mr. Knapp appears to uphold *his* definition. I think he could have saved a great deal of note paper and lost less sleep if he had either taken Mr. H. H. F.'s advice and accepted Webster as authority, or, in forming his own definition, followed out the requirements of a definition.

To have a correct definition we must know what a definition is; the logical definition of which is, the approximate genus et differentium. No one has disputed the statement that an eccentric is a circle within a circle; which, in one light, is correct. But could we not improve upon it by saying, "an eccentric is a disk (representing the genus of our definition) fixed to an axle or shaft, the center of which does not coincide with that of the disk; (this represents the differentia of our definition) the throw of the eccentric being twice the distance between the two centers."

My object in writing is not to offer a better definition than has already been given, as I feel that is impossible, but to bring to mind a rule which any one will find to be of practical use in the formation of any kind of a definition.

NICKERSON, KAS.

C. E. Matthews.

### ANSWERING MR. KNAPP'S QUESTIONS.

MR. EDITOR:—Each issue of the MAGAZINE is full of good things, and I am glad to note the wonderful improvement in the Mechanical Department since last year. If Mr. Weiler had read my article on high speed closely, he would remember that I tried to point out the difficulty of maintaining a high rate of speed regularly. The Jersey Central engine, No. 385, to which Mr. Weiler refers, made a remarkably good run for a short distance, and I have known our large passenger engines on the Philadelphia division of the B. & O., to run a mile in 40 seconds with four large Blue Line cars; and now the question is, can we maintain that speed regularly?

I was much interested with Mr. Pray's suggestion of a question box; but I cannot agree with Mr. Borland's plan for operating the same. My plan would be to send the question to the Editor and sign full name, as I believe no fireman who is anxious to learn would object to signing his name. Then let the answer be published in the next succeeding issue of the MAGAZINE, signed by the person's name who answered, or his initials, whichever the Editor would choose to publish.

Thos. P. Knapp asks some practical questions to which I hope he will receive many answers.

The object of placing the link saddle pin out of the center is to overcome the error caused by the angularity of the main rod. When the piston stands in the center of cylinder, the length of the main rod is the distance from the center of wrist pin to the center of driving

axle; now if the back end of the rod should be raised or lowered, it would fall short of the top or bottom quarter; the distance it falls short depends upon the length of the rod. The longer the rod the nearer the saddle pin could be placed to the center, as a longer rod reduces the angularity and as a shorter one increases it. In the back stroke the piston will be past the center of cylinder when the crank pin reaches the quarter, and in the forward stroke the crank pin will reach the quarter before the piston has attained half travel, and to remedy the difference of travel for an equal distribution of steam the saddle pin is set back, or out of the center.

I cannot answer Mr. Knapp's second question as I never saw oil disappear as he speaks of.

The engine Mr. Knapp speaks of might be filled up, providing there was another engine to haul the dead one up the track, plug the whistle, cylinder cocks and relief valves with waste, and as the piston would draw the air out of the boiler a vacuum would be formed and the water would then run through the feed pipe to the boiler. I have never seen this tried, but have heard of it being done. I wish the fireman who is stuck on an air-brake question would send it to the MAGAZINE, as some one might answer it and many of us might be benefited by it. I think the Editor lends the columns of our MAGAZINE to improve our knowledge about the locomotive instead of guying one another.

*Walter C. Garaghty.*

---

### QUESTIONS ON BREAK-DOWNS.

---

MR. EDITOR:—I would like to ask a few questions through the "Mechanical Department" of the MAGAZINE for my own information.

1. Suppose you were out on the road with twenty cars of stock, and your engine broke left go ahead eccentric and right link so that they could not be used, how would you fix engine so as to bring train in without assistance?

2. If tires were broken on both back driving wheels on a six-wheel connected engine, how would engine have to be blocked up, or fixed, so as to get in and stay on the track?

3. If you lost the shoe wedge and binder brace from right middle driving box on a six-wheel connected engine, how would you fix engine to run in?

4. If your engine died out on the road, and you had no pump, (only two injectors), how would you fill her up without bailing?

5. Suppose you broke out both forward cylinder heads, how would you get in alone?

6. What difference is there between a passenger and a freight air-brake triple valve, excepting size of receiving and releasing ports? Is there any?

*W. M. Pipkin.*

## DAMPS OR SWEATING LOCOMOTIVES.

**MR. EDITOR:**—There has been very little written on this subject, and why locomotives have “the damps” is very little understood by either the firemen or round-house men. We notice, when a locomotive has “the damps,” that the atmosphere is heavily charged with moisture; the temperature is several degrees above the freezing point; and the boiler has been washed out and filled with cold water. Now, the water in the boiler is colder than the atmosphere, and the moisture in the atmosphere, coming in contact with the cold walls of the firebox and flues, condenses and forms in drops of water. You have noticed the drops of water, which, in warm weather, adhere to the outer surface of a pitcher filled with cold water; the water in the pitcher is colder than the atmosphere, and the moisture in the atmosphere is condensed upon the outer surface of the pitcher. You have also noticed the same thing on engine tanks. When the fire-builder opens the firebox door to fire up this engine, he sees the water running in little streams down the walls of the firebox; he has no appliances to force a draft. What shall he do? This is what I used to do when building fires, a few years ago. First, start the fire and raise both dampers; then if the engine has an extension front, remove the cap from cinder pipe, and hand-cap from opposite side of smoke-box. You ask, why do you do this? The smoke-box is filled with a gas known as “fire damp.” This gas is sometimes found in deep wells and mines, and what we want is to get it out of the smoke-box; this is done by getting a circulation of air through the smoke-box. After removing the caps you will notice the smoke pouring from the openings, and if a torch is held within three or four feet of, and on a line with the cinder pipe, it will be extinguished. In fifteen or twenty minutes smoke will cease to appear from the openings, now hold your torch to the cinder pipe and the blaze is drawn into the opening; you have created a draft and the gas has disappeared from the smoke-box. Now replace the caps, tap the netting with a stick of wood, and drop the dampers. You ask how does this mysterious gas get into the smoke-box? I have read nothing, so far, which explains that problem. These facts we do know; first, the atmosphere is thickly impregnated with moisture; second, the boiler contains water colder than the atmosphere; third, the moisture in the atmosphere comes in contact with the cold walls of the firebox and flues and passes into the smoke-box, and the gas is generated. Now here is a chance for some older head to explain to us this mysterious gas.

NEODESHA, KAS.

*James R. Young.*

At a recent public dinner Neal Dow referred to the absence of wine from great banquets, which nobody remarks now, as it is a matter of course, and it has perhaps been this which has brought about the change for the better in the condition of workingmen. Nobody but a man like himself, who has seen both times, can realize what a complete change has come over all people in this matter.

## CLINKERS.

There are a certain class of men who sometimes become locomotive engineers, whom the creator never intended should become associates of their fellow men.

Shakespeare has described these people much better than I could; here is what he says :

"There are a sort of men, whose visages do cream and mantle like a standing pond; and do a wilfull stillness entertain, with purpose to be dressed in an opinion of wisdom, gravity, profound conceit; as who would say, 'I am Sir Oracle, and, when I ope my lips, let no dog bark!' I do know of these, that therefore only are reputed wise, for saying nothing; who, I am very sure, if they should speak, would almost damn those ears, which, hearing them, would call their brothers, fools."

There are certain occupations in which such persons may engage and succeed in going through life without making any one feel miserable but themselves, or their family, if they are so unfortunate as to have one.

But, put one of such men on the right hand side of a locomotive, and you have him in a position where his disagreeable qualities shine forth in all their hideousness; he's a first-class Jonah.

I can't imagine a more thoroughly disagreeable task than firing a locomotive, day after day, for such a man, unless it was passing coal to the devil for the purpose of heating the oven in which I was to be roasted.

I endured the companionship of such a man for a period of full six months, in the early days of my career as a fireman, and the thoughts of the misery I endured during that short period of time will, I verily believe, remain with me to my dying day.

There is no use of going into details concerning this breed of engineers; it's a mighty lucky fireman, or one who has been a very short time in the business, who hasn't had some experience with them.

Some men are born with this disagreeable quality implanted in their nature; they are to be pitied, rather than censured, and the worst thing we ought to say about them is that it is a pity they didn't select some occupation other than locomotive engineering as a means of livelihood.

Others acquire the habit of making themselves disagreeable, by long association with those who have the habit fully developed, and those are the ones who should be censured; the fireman who is naturally a sociable, obliging and gentlemanly fellow, can't afford to allow these qualities to be trained out of him.

The fireman who is so unfortunate as to become the side partner of one of this breed of engineers, should either knock him on the head with the coal pick and drop him over the right of way fence, or else quit him.

## SOME THINGS TO REMEMBER.

The following questions and answers are taken from *Locomotive Engineering*:

G. B. Ashland, Ky., asks: 1. Please tell me how to locate knocks or pounds sitting upon the seat-box while engine is running; that is, how shall I know the difference between wedge knock or pound and knock in consequence of loose brasses? 2. How shall I tell whether front-end brass or back brass of main-rod need filing? 3. How can I tell which side is lame without measuring valve-stem? 4. How to know whether it is valve blow or packing in cylinder down and to locate which side blow is on? A. 1. There are altogether too many men who want to take care of their engines and inspect them "while sitting on the seat-box." There is a trite old saying, "Naething is got wi'out pains, except dirt and lang nails." Take pains to inspect and examine your engine. The easiest way to find whether a box is pounding on account of a loose wedge or on account of a loose brass, is to block each side of the wheel and let some one give the engine a little steam and throw the reverse lever back and forth while you watch the box. 2. Notice this while testing box, the front end makes a very sharp and distinct pound while passing centers, and once started will wear very fast. 3. All depends on what causes the lameness; you can generally tell if a valve is admitting steam evenly at each end of the stroke by moving very slowly and noting steam at cylinder cocks. 4. If you put your reverse lever in the center and the pin on the suspected side on the quarter (cross-head in center of guides) the valve will cover both ports; leave the cylinder cocks open and admit steam, if any appears at cylinder cocks the valve leaks. If it don't blow test the piston by blocking engine in same position and putting reverse lever in forward corner: this will admit steam to the front side of the piston. If steam appears at the back cylinder cock the packing is down. A valve blows quite steadily, while packing down causes a roaring blow while steam is on; an experienced man can usually tell one blow from the other from the cab, especially if it is bad.

D. O'B., Mancelona, Mich., asks: 1. What is to prevent a Nathan light-feed lubricator from cross-feeding? A. The condensing chamber is separate from its cup, and there are two balancing tubes, one for each side; there being no passage for the oil from one sight-feed glass across to the opposite oil pipe. 2. About what candle-power is an ordinary headlight? A. The flame is about 24 candle-power; the reflector intensifies and directs all the light in one direction, making the light many times stronger. 3. How can the steam in an injector overcome the friction in the pipes and still feed water against the same steam pressure? A. This is a question of dynamics; the steam itself could not re-enter the boiler, but it has picked up water, which has weight, and forced it against the pressure within the boiler; it is somewhat in the nature of a blow. 4. About what would be the cost of a 28-ton narrow-gauge mogul locomotive of the common build? A. From \$3,500 to \$4,000.

E. E., West Shore, writes: The articles on valve-setting have got up quite an argument here in the shop among valve-setters, some claiming that in running over the cut-off and finding it necessary to change the valve for one motion that both forward and back blade of eccentrics should be changed an equal amount or moved the same distance. Which is the proper method? A. You certainly would not move both eccentric blades to rectify an error in one motion. It often happens that the easiest way to equalize cut-off is to throw the back-up gear "out" a little to help the forward gear. Each are treated separately in valve-setting.

J. D. R., Wolfboro, N. H., writes: Where does the most strain come on a locomotive boiler under steam? A. At the mud-ring. 2. In a train of twenty cars, which pin does the most strain come on when pulling up hill? A. On the front pin.

# WOMAN'S DEPARTMENT.

EDITED BY IDA A. HARPER, INDIANAPOLIS, IND.

## WOMEN WAGE EARNERS.

A communication appears in the March number of the *MAGAZINE*, signed "M. Crowley," which touches upon several important questions and reaches conclusions that admit of some difference of opinion. The writer expresses himself with considerable warmth in regard to women who underbid men in the matter of salaries and thus take the places away from the latter. He thinks that by lowering salaries, women make it impossible for men to support families and they are therefore responsible for so many bachelors. At the beginning of this discussion let us get one fact clearly before us, *viz.*: that women have a right to the same opportunities of earning a living that men have. It has taken the world a long time to evolve this simple point of justice, indeed, it is not yet fully recognized. Men are complaining on every hand that "women are entering their field of labor." How does it happen that this field belongs to men? They have no warranty deed. There is nothing on the records to show that they are entitled to sole possession. The fact of having occupied it does not give them either legal or moral rights, when somebody, whose title is as good as their own, puts in a claim for a portion of it.

Men have had a monopoly of the remunerative employments so long they have come to believe that they have an inherent right to them, just as they have to life and liberty and the pursuit of happiness. When women, who have been looking through the bars with longing eyes at these green pastures, muster up courage to climb the fence, the men cry out, "Keep off of our reservation. Go back to your dishwashing and knitting." The women answer, "We want money, for our needs are pressing. There is no pay in what we have been doing. Let us come over and work with you." The men say, "Keep away and let some man furnish you with the money." Well, to make a long story short, in some cases there is no man responsible for the support of these women, in others the man who ought to care for them will not do it, or is not able to do it. Necessity presses them hard; others are dependent upon them; they are capable and ambitious, they look over into the productive fields of paid labor; the faint spark of independence and self-assertion, so long crushed and smothered, blazes up into a flame; they throw down the bars and rush in; they will never go back; these fields no longer belong exclusively to men; henceforth they must divide the work with the new laborers.

Women have now become bread winners; they have entered into the race where the strong succeed and the weak go to the wall. The

revolution has been a great, although a bloodless one. The world must learn to adapt itself to these new conditions. Business knows no chivalry, competition is no respecter of sex. Here is a new element, woman, seeking not to drive men out, but to secure a place for herself. Men are in possession, they have proved their capabilities; women are an untried factor. Employers of labor are not going to make any experiments, that may be a failure, unless they see a possible gain in them. Obviously there is but one way for women to get even so much as a trial and that is to work for lower wages. On this basis employers will give them a chance; on any other they will not take the risk. When she has secured her position the woman knows that always there is a man waiting to take it, that the fact of her being a dependent woman will not prevent his doing it, that her safety lies in accepting, without protest, wages lower than a man will work for. Women are accustomed to small economies, to self-denial, to making one dollar do the work of two, so she struggles along on her meager salary because it is that or nothing. This is not because she has any animosity to the man, but simply through the instinct of self preservation.

That this has a demoralizing effect on wages in general cannot be denied. As women become better equipped for work they will enter practically all fields of labor, and there will be no employments, except those requiring great physical strength, where men will not have to meet this competition. No remonstrance on the part of men can prevent this situation. The only thing for them to do, therefore, is to face it and to find a solution for the difficulties it presents. The vast majority of men and women will marry, and, after marriage, the husband will support the family by his labor and the wife will remain at home and care for the house and children. Are these men perpetually to have their wages lessened through the competition of women? Many years of careful study on the part of the writer of this article have confirmed the belief that there are but two ways to put a stop to this ruinous underbidding by women: first, by admitting women into full membership in all of the trades unions and labor organizations; and second, by extending to them the right of suffrage.

The scale of wages among men is made and maintained through these organizations. If they were not bound by fraternal ties to stand together in this matter, and if it were not made a disgrace not to say a crime, for a man to take another man's position at less pay, the whole structure would go to pieces and utter demoralization of wages would follow. If women were made members of these unions, with a fixed scale of wages and the assurance of protection and support in case they resisted the attempt of their employers to lower them, and if all working women were brought into these organizations, it would have a marked effect in preventing this underbidding. But there are many obstacles in the way of this scheme. The occupations in which most women are employed are such as have no unions, those of book-keepers, clerks, stenographers, type-writers, etc. The labor organizations would include those only who are employed

in the mills and manufactories. Another drawback would be the difficulty of getting women into unions. They have not learned the value of organization, or how to work together. A man expects to work for a living all his life and therefore he wants to acquire the standing and the strength in the world of labor which comes from associating himself with those in his own line of work. Railroad men, iron workers, miners, carpenters, each class of workers desires the power which comes from co-operation and the many benefits of organization. Women, on the contrary, have the idea that their work is only temporary, they will drop it as soon as they marry, and they will manage to get along somehow until they give it up entirely. Another very serious obstacle to the forming of trades unions among women is a certain feeling prevailing among many of them that they do not wish to make public acknowledgment of the fact that they are working women. There is also a great body of unskilled labor among women which could scarcely be classified or organized. Therefore, while it undoubtedly would be to the advantage of men engaged in occupations where they have to meet the competition of women, to bring the latter under both the restriction and protection of their unions, yet this would not wholly solve the question under consideration.

To what degree would the possession of the franchise affect this matter of wages? It is usually declared that wages are regulated wholly by the law of supply and demand. How does it happen then, that when a body of men strikes for higher wages and another body is ready to take their places even at a lower rate, the latter do not at once get the work? In all of the ordinary employments there are more laborers than there is work for them to do, and yet there is not a constant cutting of wages on this account. It almost ruined the chances of a presidential candidate because it was rumored that he said "a dollar a day is enough for a workingman." If he had made this statement in regard to workingwomen it would not have hurt him. Why? Because no woman could have replied with a vote. Workingmen could get no recognition in legislative halls if they were not able to back their demands with a ballot. Politicians do not take up the fight of the workingman through love of his cause but through fear of his vote. He can always find champions and defenders because of his political influence. Give women this same influence and they will have a weapon against oppression. If they are receiving forty or fifty cents a day the matter will be investigated and the responsibility fixed where it belongs. Every woman who joins a labor organization of men will bring to it the strength of her vote. Instead of competition there will be co-operation. It will not be necessary for women to underbid in order to secure work, because they will stand an equal chance with men, which is not now the case. We do not claim that the ballot will secure for women all that they desire; it has not done this for men. But we do hold that in a country which is maintained through individual representation, that individual who has no representation is at a great disadvantage, and, in the case of workingwomen, the workingmen themselves must suffer because of this discrimination.

Two other points in Mr. Crowley's article demand attention. In the first place, it is doubtful if there is any perceptible decrease in the number of marriages, notwithstanding all that is said and written upon the subject; but, granting, for the sake of argument, that the number of bachelors is increasing, it would be difficult to prove that it is brought about by woman's entering into the industrial world and thereby decreasing wages. The bachelors are found, for the most part, among men who are amply able to support a wife. The truth is that the modern man himself has formed luxurious tastes. He likes his club, his horse, his good cigars, high living generally, and he is not willing to sacrifice any of his personal comforts for the sake of a wife and a home. It is not that his wages will not permit him to support a family, but rather that he prefers to spend them on himself. The last census shows that there are a million and a half more men than women in the United States, and therefore a large number of men are compelled by necessity to remain single. The most probable reason, however, for this increase of bachelors, if there is an increase, lies in the fact that the women themselves are in no hurry to marry. There was a time when a girl was practically compelled to marry as soon as she was old enough. She was a consumer, not a producer, a burden on father or brothers, which they expected to transfer to a husband at the proper time. She married to be supported, and very often, it may be believed, from necessity rather than choice. This situation is now changed. Women have become self-supporting and independent and are not compelled to marry for the material considerations of food, clothes and shelter. They can take their time to think it over and the sensible ones will not marry unless by so doing they will better their condition. People are too apt to come to the hasty conclusion that men are bachelors because they do not want to marry, while the truth is, that in many instances, it is because the women do not wish to marry them.

Lastly, men are somewhat rash in their assertions that "girls have no one to work for but themselves," and that "they spend all they earn on clothes." There are unnumbered thousands of working women who have others dependent upon them, who are supporting old fathers and mothers, helpless brothers and sisters, and little, fatherless children. Indeed the woman who has no one but herself to take care of is the exception; there are probably no more of them than there are of young men who have only themselves to support. One reason why they appear well dressed is because women use money more judiciously than men and do not spend in drinking and smoking and betting and other excesses enough to clothe themselves. Another is because they sit up into the small hours of the night ripping and turning and washing and making their dresses, and practicing small economies that men, as a rule, know nothing about. In regard to the charge that women spend all they make on finery, the savings banks and the building and loan associations tell another story. Their books bear the names of thousands of women, of the vast majority of working women, indeed, whose wages will permit

of even the smallest saving. It is the natural disposition of women to want to lay by something for a rainy day.

These charges, which we have tried in a measure to disprove, have been made so long and so recklessly that thoughtless persons are apt to accept them as true. If any statements have been presented in this article with which our readers disagree we will be glad to publish their views upon these questions.

---

## DAILY ITEMS.

When this number of the *MAGAZINE* reaches our readers, the Columbian exposition will have been thrown open to the public. It is appropriate that this new hemisphere should make the grandest exhibit the world has ever seen. It is gratifying to feel that we cannot be surpassed. It must be remembered, however, that all the nations of the earth have contributed to the success of the fair. Equally as important as the magnificent material exhibit will be the series of congresses to be held during the entire six months, which will call together the greatest parliament of intellects ever assembled. These congresses will consider the topics of religion, law, medicine, politics, music, art, literature, mechanics, agriculture, suffrage and many other vital questions, which will be discussed by the leading men and women of the age. We extend the wish that every one of our readers may be able to spend some time at the Exposition.

---

Governor Lewelling, of Kansas, has signed the bill providing for a submission of a woman suffrage amendment at the next general election in November, 1894. Of course the women will not be permitted to vote on the subject themselves, but must stand around like a poor boy at a frolic and see whether the men, white and black, native and foreign, educated and illiterate, gamblers, saloon keepers, etc., will kindly permit them to exercise the right of an American citizen. The Minnesota senate has passed a bill giving municipal suffrage to women. The Arizona house of representatives has passed a bill giving full suffrage to women. The municipal suffrage bill was defeated by a small majority in the Massachusetts house, although 100,000 women petitioned for it. And yet men will keep right on saying that when a sufficient number of women ask for suffrage they will get it. If they would state the exact number, women would have something for a guide. One hundred thousand in one state seems a good many to be refused.

---

Professor Maurice F. Egan says, in the *Pittsburg Catholic*, that the reason so many young women of that faith marry Protestants is "be-

cause Catholic young men, as a rule, are inferior to the women in education and cultivation, and it is not to be expected that girls will marry their inferiors." The *New York Independent* declares that this is not a peculiarity among Catholics, and further observes, "We fear the chief reason why so many young women delay or neglect marriage is because they do not find young men who are their equals." If women themselves said these things they would not sound well, but when they come from two prominent newspapers, it seems as if there must be some truth in them.

---

Previous to the recent inauguration ball, an enterprising Washington newspaper sent out a large number of cards to the ladies asking for a description of the toilets they expected to wear. Seven thousand replies were received. And yet the next morning all of these seven thousand women doubtless declared that they "did wish the newspapers would not give them personal notices."

---

Miss Louise Aldrich Blake, daughter of an English clergyman, has just won the highest honors ever gained by a woman, "double first," in the examinations at London University. No wonder some of the doctors object to a woman's entering the profession. They would not enjoy sitting on a back seat when a woman was perched up on the front.

---

## TO OUR CONTRIBUTORS.

---

"A Carman's Wife," Marshall, Texas; "N" Monroe, La.; "A Fireman's Sweetheart," Butler, Ga; and several others, contributed to the waste basket this month by failing to sign their names to their communications. Please do not write and ask that an exception be made in your case. The rule is inflexible. If it were disregarded for one it would have to be for others.—Mrs. J. B., Tyler, Texas; the lines you send on the death of a friend cannot be used unless we know the name of the author.—Some of our writers do not understand that when they put a title at the head of their communications they must not be written in the form of a letter. We receive them, for instance, entitled "Spring," and the writer tells us that she has intended to write for some time, that she enjoys the *MAGAZINE*, that she hopes this will not reach the waste basket, and that she sends her love to all the boys. Take your subject and stick to it, as if you were writing an article for a newspaper or an essay to read before your club. It is just as easy as letter writing when you get accustomed to it.—We would like articles on summer house-keeping, the care of children in summer, reading and recreation suitable for hot weather, and other seasonable topics.

MAY, 1893.

## LABOR ORGANIZATIONS, STRIKES, COURTS AND LAW.

Judge Billings, of the United States Court for the Eastern district of Louisiana, recently fulminated a decision against the Workmen's Amalgamated Council of New Orleans, of special and vital importance to workingmen throughout the country.

The case with which the ermined Billings wrestled grew out of a disagreement as to wages and hours of labor between warehousemen of New Orleans and the principal draymen and their subordinates. The facts showed that the wages were degradingly low and the hours of work shamefully excessive, and that the employers resisted every peaceable effort on the part of the men to establish justice and fair dealing. Having exhausted all the means at their command to adjust the trouble and failed, they concluded to strike. The cause being just, the workingmen of New Orleans sympathized with them and therefore the Amalgamated Council of New Orleans issued a call to all union men to stop work and assist with their presence and open support, the purpose being to impress upon all concerned the fact that all the labor unions in New Orleans were united. This call on the part of the Amalgamated Council alarmed merchants and business men, for they saw it would have a serious effect on business—in a word that it would put a stop to business—but, instead of agreeing to pay fair wages, and require a less number of hours for a day's work, they fly to the courts where they find a judge ready and willing to do their bidding, and the judge immediately finds some sort of a law in the interest of capital and opposed to labor, and in this case the act of congress upon which

the judge based his decision was declared "to protect trade and commerce from unlawful restraint and monopolies," being the Anti-Trust act.

The persons who appealed to the judge, made a grand flourish of alarming statements. They "alleged in substance that there was a gigantic and widespread combination of the members of a multitude of separate organizations for the purpose of restraining the commerce among the several states and with foreign nations, and that in consequence thereof, the whole business of the City of New Orleans was paralyzed."

In such statements the alarmed merchants and business men, declare, unwittingly perhaps, a fact of tremendous significance that it is labor and only labor that carries forward the business enterprises of the country; and yet, when labor impoverished and oppressed, seeks, by the only means at its command, to secure justice, the courts are called upon to strike it down in the hour of victory and return it to its old conditions of toll and degradation. Such appeals and such decisions are full of danger. They unite workmen closer in the bonds of union, as does tyranny always and everywhere, while it intensifies their hostility and hatred of despotism; and when the day comes, and it seems to be coming, that workmen must hold their council in secret places to deliberate upon their rights and the wrongs to which courts or caltiffs of any rank subject them, the time will have come to write the epitaph of the republic. Judge Billings doubtless chuckled over his decision and employers took delight in seeing their employees intimidated and crushed; but should the time come when an Amalgamated Council, not of New Orleans, but of the country calls out union men to assist with their "open support" these wronged fellow-workmen, Judge Billings and all other judges will find their orders dethroning the rights of workingmen of as little avail as would be a tin whistle in drowning the roar of Niagara, or a straw in staying the gulf stream.

Council for the workmen presented to Judge Billings numerous and cogent reasons why his restraining orders should not issue, all of which the judge brushed aside, deciding that the provisions of the Anti-Trust act supplied him with all the law he wanted. He said:

"I think the congressional debates show that the statute had its origin in the evils of massed capital, but when the Congress came to formulating the prohibition, which is the yardstick for measuring the complainant's right to the injunction, it expressed it in these words: "Every contract or combination in the form of trust or otherwise in restraint of trade or commerce among the several states or with foreign nations is hereby declared to be illegal." The subject has so broadened in the hands of the legislators that the source of the evil was not regarded as material, and the evil in its entirety is dealt with. They made the interdiction include combinations of labor as well as of capital;

in fact all combinations in restraint of commerce without reference to the character of the persons who entered into them. It is true this statute has not been much expounded by judges, but, as it seems to me, its meaning as far as relates to the sort of combinations to which it is to apply is manifest, and that it includes combinations which are composed of laborers acting in the interest of laborers."

Here then, a labor organization becomes a Trust within the meaning of the law, and is therefore unlawful, and workmen are capitalists within the meaning of the law, and in combining their capital become law breakers. It is no wonder that judges are sensitive about "contempt" since by all the gods, if contempt were ipecac, the judges are supplying enough to vomit the world.

#### A DANIEL COME TO JUDGMENT.

The *Railway Age* comes to the rescue of the railroads in grand style. It jumps on to the switchmen, metaphorically, with both feet, and its boots are iron-clad, spiked toe and heel. It kicks like an army mule, paws dirt like an irate bull, and cavorts like a warhorse whose neck is clothed with thunder. Hear it:

If ever there has been a time when it was necessary for the railway companies to stand together, they must stand together now to resist the demands of the switchmen of Chicago for an increase of pay. There is no principle involved in the demand; no justice in it. Switchmen are not poorly paid to-day. They are well paid, and there is no excuse or reason for a demand for higher pay now, except the belief that the time is favorable for compelling the railways to yield to it. Not only would there be no justice in the railways granting the demand, but there would be gross injustice. The officers and managers of the railways are in control of properties which do not belong to them and whose revenues are not theirs to do with as they please. The railway properties belong to about 2,000,000 individuals who are stockholders; and it is these 2,000,000 stockholders to whom justice must be done. To sacrifice their interest now in according to this demand would be cowardice and breach of trust. It is true that a general strike may follow the refusal of the switchmen's request; and strikes are always to be deplored. But there are times when peace is shameful, however costly war may be. And there are times also when war is less costly than peace.

The clarion voice of the *Railway Age*, advising "the railway companies to stand together" against the Chicago switchmen, is so much wind thrown away, unless the railway companies are engaging trade winds to blow them up and to blow switchmen down. If the *Railway Age* blows for a fee, then, indeed, it is entirely in consonance with the *Age*, in which money inaugurates public debauchery, gilds vice to attractiveness and so transforms men that they wear corporation collars and regard them with special pride as decorations, seemingly unconscious of their debasement.

The business of switchmen has been pronounced by the highest railroad authorities as the most perilous in the railway service, and the employment of "barbers" and "farmers" at Wann, Illinois, because their services could be had for small compensa-

tion, resulted in an accident so horrifying as almost to defy description, the responsibility for which, a committee of the Illinois legislature fastened upon the management of the road and charged it directly to the employment of incompetent switchmen. The loss to the road, when the dead and mangled obtain compensation, through the courts or otherwise will approximate \$300,000 and possibly more, and would have sufficed to have paid competent switchmen the difference between decent and degrading wages, at least forty years. Possibly the "stockholders" will think far more harshly of the management than of the switchmen, and conclude that their interests depend largely upon the employment of competent men, a fact, which the *Railway Age* might profitably consider.

But the *Railway Age* wants all the brotherhoods wiped out effectually. It deplores strikes, but with all their cost and sacrifices, deems them vastly preferable to paying fair wages. Its hostility to organization, like Nebuchadnezzar's furnace, is seven times hotter than usual. It out Corbin's Corbin. It says:

The railways have yielded too often of late to demands for higher wages. The line must be drawn somewhere and a stand made. And the place to make that stand is now—and let the stand be so firm and the railways so united that not only these few switchmen, but all the railway employees, and not only all railway employees but the people of this country, shall understand once for all that the interests of 2,000,000 stockholders are not to be further surrendered to the insolent demands of a handful of organized employees. The number of employees of the railways of this country who are organized is trivial—less than 150,000 men, even according to the claims of the brotherhood themselves. And what right have these men to dictate on behalf of the 850,000 men in the railway service? What right have they to confiscate and plunder the revenues of the stockholders? What right have they to threaten and terrorize the people of the United States? There has been too much intimidation by the brotherhoods already; too much cowardice on the part of the railway interests.

That is right. Let the stand be taken now. Let the impending crisis come. If railroad employees are to wear the badges of slaves, now is as good a time as will ever come, to fasten them on with hooks of steel. If working men are to crawl, the closing years of the nineteenth century is as favorable a period as will ever occur for them to get down on "all fours" at the bidding of the magnates. There are about 20,000,000 of them, all sovereign citizens, all have the ballot, all walk beneath the starry banner, *alias* "Old Glory." The *Railway Age* asks: "What right have 150,000 to demand higher wages?" Let the *Railway Age* proceed with its interrogatories. Let it ask, what right working men have to live without a license granted by corporations. What right have they to demand such wages as will provide men and children something better, in the way of a habitation than the lairs of wild beasts? What rights for clothing better than the hair and fur of foxes or the feathers of buzzards?

Millionaires are answering the questions and workingmen are protesting—the crisis is coming. Let it come. Railway companies will stand together, and the demand is for railroad employes to stand together. Fair wages, reasonable hours, manly treatment include about all the demands of railway employes. If such demands cannot be secured, if corporations, courts, money and the military machine, can, in combination, strike down such righteous demands, the fact may as well be known now as at a later date.

### JUDGE RICKS.

Reverence for law is a distinguishing characteristic of the American people, and to a certain extent, this homage passes to courts and to judges, hence, when the acts of judges bear in any degree the stamp of corruption, when courts no longer administer justice, when law is tortured out of shape to favor the strong and oppress the weak, a fatal blow is aimed at the rights of the people and the foundations of government feel the shock; and a corrupt judge is held to be a deadly enemy of the people. As a result the acts of judges are, as they ought to be, subjected to the severest scrutiny.

The conduct of Judge Ricks, of the United States district court, is now undergoing investigation, and honest men are of the opinion that the ermined gentleman is corrupt and totally unfit for the office of judge, and the reasons assigned for such conclusions are of a character to visit conviction upon the minds of thoughtful men.

To state the case briefly: Judge Ricks was wanted in Toledo. He was in Cleveland. To get him to Toledo was imperatively demanded by the corporations, whose interests were involved in the strike on the Toledo, Ann Arbor & North Michigan R. R. To get him quickly, first the wires were used by the corporations, and then a special train, consisting of a locomotive and one car was dispatched by the Lake Shore corporation to bring him to Toledo.

Arriving at Toledo, Judge Ricks, instead of going to the court house, proceeded at once to the office of the Lake Shore railroad corporation, where he was brought into contact with railroad officials, from whence he issued his orders, reeking with the stench of corporation influence. Placed under obligation to the corporation, Judge Ricks' orders bear the impress of corporation views of law, as certainly as if they had been issued by the corporation bearing the great seal of the incorporated body. The special train and other equally potent influences had done their work. The required orders were issued and the legal farce proceeded. Workingmen were arraigned; their rights invaded; their liberties restrained; and the disgusting program carried out to the letter.

What of this? The flagrant outrage ought

to result in the impeachment of Judge Ricks. He has made himself odious and contemptible, and labor organizations and the labor press of the country should make the demand for his impeachment so loud and strong, as to bear down all opposition.

### GRAND MASTER SARGENT AND THE TOLEDO AFFAIR.

Judge Ricks, who included Grand Master F. P. Sargent, of the Brotherhood of Locomotive Firemen, in his restraining order with Grand Chief Arthur on the boycott matter, found, by the presentation of the facts by T. W. Harper, Esq., of Terre Haute, that Bro. Sargent was outside his jurisdiction, and therefore dismissed him from further annoyance—an instance of judicial haste on the part of Judge Ricks in issuing his order, anything but commendable. It is, however, a pleasant reflection that Bro. Sargent voluntarily made his appearance at Toledo and at the proper time, Mr. Harper, who is the attorney of our brotherhood, proceeded (to use a term) to knock out his honor.

Bro. Sargent, however, is held, with Grand Chief Arthur, to respond April 15th at Toledo in a case wherein the Toledo, Ann Arbor & North Michigan Railroad corporation asks damages to the amount of \$300,000 to cover the loss sustained by the strike. If the corporation succeeds in securing so nice a plum as \$300,000 the MAGAZINE will not hesitate to felicitate the corporation immensely. We apprehend the suit is for buncombe only, though it may have some of the ear marks of bunco; but it will not be tried by Judge Ricks "in chambers," nor elsewhere, and though for a large sum of money, excites ridicule. Serenely we wait and watch developments.

We have on our table No. 1, Vol. I. of the *Weekly Advance*, organ of the Central Labor Union, of Evansville, Ind., and published by J. P. MacDonagh, Esq. In the "Tip" we notice the following:

The mission of the *Advance* is to develop a more ardent sentiment of unity, brotherly regard and fraternal feeling among all classes of united labor; to discourage factional rings, hateful discords and petty jealousies within organized ranks, which too often exist to the detriment of our interests and success; to stimulate the indifferent and tardy member to a more active and earnest interest in his organization; to urge the ever faithful and active ones to once more reach out the right hand of fellowship to the recreant and backslider and rescue him at all hazards from the evil influences which have environed him since his desertion and make him feel by every act and word that all his transgressions will be forgiven after his regeneration; to go out among the unorganized toilers and infuse them with the spirit of unionism by preaching and teaching the gospel of "the fatherhood of God and the brotherhood of man."

It affords the MAGAZINE pleasure to extend the right hand of fellowship to the *Advance* and to wish it a career of exceptional success.

## LESTER C. HUBBARD.

The *Vanguard*, under the editorial control of Lester C. Hubbard, Esq., is what its name implies, the advance guard in the new and better thought of the nation, and this better thought, because broader, and deeper, and higher, is bringing into line a vast army of men, whom the *Vanguard* is assisting to realize a "diviner civilization." Mr. Hubbard is a writer who indulges in "thoughts that breathe and words that burn," not only in the columns of his paper, but in his great work, "The Coming Climax,"—a book that should be in the hands of those who would understand the trend of events. In the number of the *Vanguard*, March 25, we read with special interest the remarks made upon the shrewdness of millionaires in their management of their affairs, as follows:

By this token we are justified in remarking that the plutocrats have shown themselves to be uncommonly deep and of serpentine wisdom in the matter of establishing positive ownership in the judiciary of the country. If the millionaires make the judges they care but little who make the laws, although in construction of statutes favorable to their special interests the plutocrats have shown themselves peculiarly expert. The great corporations of the nation have during the last twenty years expended millions on millions of dollars at Washington and the various state capitals in the purchase of such legislation as they happened to want. But the bribery and corruption of law-makers has been merely a secondary consideration with the plutocrats in their legalized pillage of the people. Their mainstay, solid support, and sure defence has consisted in the bought judges, whom they owned body and soul.

Manifestly, the hopes of the plutocrats center in the decisions of courts, and as a general proposition, they see little to discourage their expectations in such decisions.

We have received the April number of the *Railway Shop Employees' Journal*, No. 1, Vol. 2, and note with real satisfaction the progress the publication is making, as also, the rapid growth of the order, now having 125 subordinate lodges. We notice among the other good things said by Editor Anthony, the following:

The labor organizations of our country must get together. To do this some remodeling must be done. Some old foggy ideas must be given up, and some ultra-radical notions must be held in abeyance. The great obstacle in the way of obtaining the unification of the several bodies of wage workers is the supremacy which each claims for itself.

It can not be impossible, surely, for different classes of workmen to affiliate when all really have one end, and but one, in view—the amelioration of the condition of all. There is nothing antagonistic between the workman who makes \$5.00 a day and the one who makes 95 cents except the difference of circumstances. Were the common laborer given the advantages and opportunities which his more skilled brother has had, he might have distanced him in the race. But each is dependent on the other, and all must stand together, or no permanent good can be gained.

We have received a copy of *Engine Room Chat* an interesting little volume of 144 pages by Robert Grimshaw, M. E., dedi-

cated to "Throttle-twisters, wherever they may be found, with the good wishes of one who knows them, likes them and has always relied on them." The author presents "in what has proved to be a popular style, ideas which appeal to all interested in the question of power, more particularly those charged with the care of engines and boilers and their appurtenances." The book is gotten up in the form and nature of a "chat" on a large variety of subjects, some of which are happily illustrated. A good deal of quaint humor is woven into the work so as to make the subject-matter less prosy and monotonous, and we commend it to our readers as a book both interesting and instructive. The price, postage pre-paid is \$1.00 per copy and orders should be addressed to Practical Publishing Company, 21 Park Row, New York, N. Y.

## FIREMEN'S RIGHTS.

MR. EDITOR:—I desire to reply to the communication of O. N. Carpenter, which appeared on page 254 of the *MARCH MAGAZINE*. Bro. Carpenter says "the time is past and gone when an engineer may choose his fireman, or make a kick and have him pulled off." Bro. Carpenter is mistaken in this assertion. Engineers may complain the same as usual, only their complaint must now be made in writing; if a fireman does not suit an engineer, he (the engineer) will come pretty near getting him pulled off the engine, and when engineers have no recommendations for a fireman he stands a poor show of getting along. I know cases of this kind here. As to round house foremen, while they do not have the handling of the men, they handle the extra boards and men through instructions from the local chairman, and I do not think it is anything for a brother to boast of through the columns of the *MAGAZINE*. It is always better to try and promote harmony, rather than to boast of our good rules, and cause strife by so doing. While I do not believe it necessary for a fireman to tag after anybody's coat tails, nor do I believe engineers, as a rule, want firemen to do so, it is right and proper for a fireman to have respect for his engineer and not be so independent as to say by his actions "you help yourself and I will do the same."

I do not believe the engineers want to get the better of the firemen in the matter of federation, and cannot think for a moment that there is any danger in federation with them.

As to B. L. F. runners acting on boards of adjustment, Bro. Carpenter reminds me of the story of the heartless father and his treatment of his son when he became of age. It was a cold December day in a northern state; the snow was deep and a fearful storm was raging; the father said to his son, who had been a faithful boy all his life, "You are

twenty-one years old to-day, and I want you to pack your grip and get out of here, you can't stay with me any longer." So it is with Bro. Carpenter; as soon as B. L. F. men are promoted and eligible to the B. of L. E. he wants them to pack their grips and get out. I hardly think Bro. Carpenter knows what he is talking about when he makes such remarks, or else he doesn't stop to think how badly it sounds. If we, who are B. L. F. runners, should all leave the order on the A. T. & S. F. and operated lines, the ranks of the B. L. F. would be reduced in number, at least one third. Bro. H. N. Norton told me, while in Cincinnati, that, on the Southern Pacific, the B. L. F. runners were in the majority and handle the business for the men there.

Bro. Carpenter forgets that we have gray-headed men in our order who are running engines to-day; he also forgets that our standing protective board, on the A. T. & S. F. and operated lines, is composed of B. L. F. runners, with but one exception, and a more zealous, hard working set of men, for the interests of the firemen, cannot be found. Bro. J. R. Scott, as general chairman, has not an equal, and Bro. Sargent, our Grand Master, will bear me out in this. Bro. W. F. Smith, the chairman of the A. T. & S. F. proper, devotes two-thirds of his time to adjusting grievances for the firemen and is away from his home and family, at least, half of the time. These brothers are B. L. F. runners, and yet Bro. Carpenter thinks it wrong to have them on boards of adjustment. Does the record of their work look as though they were not interested in it? I am glad to know that we have but few in our ranks, of Bro. Carpenter's opinion, for if we had we should have none of those privileges which Bro. Carpenter boasts of regarding engineers and round house foremen, and the harmony and good feeling, which now exists between the engineers and firemen on the A. T. & S. F., would soon end; instead of their meeting jointly each year they would be trying to cut each other's throats.

If we were to take Bro. Carpenter's advice we should reduce Reno Lodge almost one half; we shall not take his advice just yet, but if he was a member of 258 we should come pretty near reducing our membership one. While I have the best of feeling for the B. L. E., and think it right for all runners, who wish to, to belong to that order, I do not think it right to adopt Bro. Carpenter's plan, and drive men out of the firemen's order or deprive them of the right of acting on boards of adjustment because they have been promoted.

Brother Carpenter should remember that it is men of true blue who stick to the order; they pay their dues and assessments the same as he does; and, having been in the order a great deal longer than he, are more

competent to legislate for the firemen's best interests. So long as harmony and good feeling exists among the rank and file of engineers and firemen, I don't know as it makes much difference which order one belongs to; so long as one belongs to one or the other and does what is right towards his fellow men, trying to promote harmony and good will all along the line.

I trust that this will be taken in the spirit in which it is offered—that of peace, harmony and good will. *Charles W. Arnold.*

NICKERSON, KAS.

### SOME GOOD ADVICE.

MR. EDITOR:—Being in conversation with a fireman recently, he related to me a tale of woe concerning how he was treated by his engineer. He said he could do nothing to please him, and, furthermore, he did not try to please him. I was surprised at this, as the fireman is very apt and intelligent, and also a perfect gentleman. It seems to me that there should exist a feeling between a fireman and engineer, which is anything but hatred. But in order to realize such a feeling, each must prove himself worthy of the other's confidence. Never be guilty of a low or degraded act. It matters not how trifling it may appear at first, a little, low act continues to grow as does the smallest vegetable seed. One speck upon the telescope dims the brightness of the sun, so one little, low and degraded act dims the beauty of character. By so proving yourself, you will always be respected, not only by your engineer, but also by your superior officers. It will not only make a name for you which will shine out to your fellow workmen, but one that cannot be effaced by death. It will live after death, and be remembered by all with feelings of honor and respect, though you may have been only a fireman. Don't think for a moment that because you are a railroad man you should lose self-respect, as some railroad men do, but let your daily motto be: "*Take my life but not my character.*" How many poor mothers there are who, in far distant lands, are daily and nightly asking God to guide and protect their wayward sons who have chosen so daring and dangerous a vocation. How many of us have been called to go out on cold and stormy nights, with the sleet and rain beating against the windows, and as we whirled through the lonely and dismal swamps have expected at any moment to be called to give an account of ourselves before the King of Heaven. Then let us endeavor through life to maintain a pure character and a gentlemanly principle, and by so doing, feelings of hatred will never arise between an engineer and fireman.

*Thomas P. Knapp.*

## THE PROMOTION QUESTION.

MR. EDITOR:—I entirely agree with you on all points which you so clearly brought out in your article captioned "Promotion of Firemen and Hiring of Engineers," which appeared in the February MAGAZINE.

Especially are you right in saying "The question now to be discussed is probably as delicate as any one that could be suggested, and if our views in the matter should be adopted and acted upon, the members of the B. L. F. would be required to make all the concessions and sacrifices; nothing of the kind being required of the B. L. E."

You are right; the subject is a delicate one, and yet, why should it be? If the members of our order are right minded, and fair thinking men—and they have given ample proof in the past that they are—they surely can look ahead far enough to see what the future has in store for them all unless this vexed question is settled. As you say "the firemen would have to make all of the sacrifices," but it is better for us in the long run to fire a year or two longer before being promoted in order to make the promotion worth working for. Then when we are promoted we have some assurance that our promotion is a thing which will last long enough to be of benefit to us. But here comes in an important part of this question, which I am sorry you did not touch upon. Is it fair for one or two roads to adopt the 50 per cent. plan while all other roads remain neutral? On the C. R. I. & P. they have adopted the man for man or 50 per cent. plan, which would be perfectly satisfactory if all other roads would do likewise. But think of it! you say there are 4,000 idle engineers or you take that as a basis to work on. Now shall the Rock Island make room for these 4,000 men while all other roads promote their men and add to the 4,000 idle men by occasional discharges? You see the point by this time I am sure. If all the roads in the country would adopt this 50 per cent. plan it would not take long to provide for the large number of idle engineers; but you can readily see what a great injustice it works upon the firemen of the few systems, and how small a benefit it is to the 4,000 idle men. I say let the committee you propose make a general rule for all roads in the country or none at all. Here is another part of this important question that will bear discussion; while we have 4,000 idle engineers in the country, we have an equally large number of idle firemen who should be looked after, but they are a class whom you never hear mentioned by the supporters of the theory of hiring idle engineers. Many of those who are the loudest in advocating the idea of taking every other engineer from the ranks of the idle, are the first to both advocate and practice the idea of taking a wiper

out of the round house and breaking him in to suit his taste rather than take an experienced man, because the experienced man might have ideas of his own which might conflict with those of the engineer. To promote a man and hire a man is right and just, providing all roads adopt the rule, but there should be some provision made for our idle firemen. It is surely better for the railroads to employ experienced men in preference to green men, and I surely think that if the firemen are willing to sacrifice one-half of their chances for the benefit of the idle engineers the engineers should, by right, do all in their power to have the idle firemen employed in preference to wipers or green men. I have enlarged on this subject to a greater extent than I intended, I will close with the wish that the committee you speak of may be formed and empowered to make a national 50 per cent. rule for both sides.

*E. J. Snyder.*

## NEW RESOLUTIONS.

MR. EDITOR:—No day in the year induces such a thoughtful state of mind as New Years Day. On that annual occasion we take a review of the past year, and carefully peruse the pages of individual history. To some, such perusal brings satisfaction and contentment; they have been crowned with success, and that makes life happy. To others the process of retrospection is attended with nothing but mental pain and a remembrance of many things they would fain forget. The human family is prone to err, yet its members retain the power to begin a new year with a firm resolution to do that which is noble, upright, and just. Perhaps it is easier to preach than to practice, yet all must agree that the world would be one of unrest and chaos, were it not for the good resolutions of those who have had the courage to stick to them.

From the newspaper reports one would infer that the Pennsylvania Railroad Company intends to dismiss from its service all of its employees who are members of any union. Such a purpose, carried into execution, would work serious hardships to a great many men. Look at the many thousands of dollars paid out monthly by these unions for the benefit of disabled and deceased members.

If this fight against the unions is attempted, I am satisfied both the press and the people will be with the men. However, I hope the rumor is unfounded. Here, on the Vandalia, we apprehend no such trouble. Our chief officials are men of honor, who have, in the past, done all in their power to benefit their employes. Hence, there is no foundation for a suspicion of trouble.

*C. H. Arthur.*

TERRE HAUTE, IND.

# TO RAILROAD COMMISSIONER KIRKBY, OF OHIO.

Mr. Kirkby, you cur, you betrayed the great trust  
Which the boys in their confidence gave you;  
And, as sure as the God of the lowly is just,  
From our vengeance there's nothing shall save you!

You're a lick-spittle sneak, and you bend your  
weak knee  
At the throne of our tyrant oppressors;  
But you'll find just as sure as these lines are from  
me,  
We're not slaves nor illegal transgressors.

You've betrayed us, you wretch, for your stomach  
and guts;  
You're the Benedict Arnold of labor!  
And your dupes yet are men, yes, though groveling  
in butts,  
Stricken down by your treacherous saber.

Grand Chiefs Arthur and Sargent have led us for  
years,  
They have always been faithful in trouble;  
While yourself, you base beat, have now engine-  
men's sneers,  
Which shall stalk at your side like your double.

We shall stand by our friends if all hell should  
arise  
In the fury of intimidation;  
And our foes we will seek between earth and the  
skies,  
Till we give them deserved compensation.

It were better you died ere you saw Heaven's light,  
Than to live for the shame which we'll make you;  
For we'll sink you so deep from political sight  
That the trump of an angel can't wake you.

*Shandy Maguire.*

## LEGISLATION.

MR. EDITOR:—I desire to call attention to a bill which became a law, with the approval of the governor, in the state of Minnesota, March 6th, 1898. The bill is numbered: H. F. No. 86. It is entitled "A bill for an act declaring it a misdemeanor on the part of employers to require as a condition of employment the surrender of any right of citizenship." And it reads as follows:

*Be it enacted by the Legislature of the state of Minnesota.*

Section 1. Any person or partnership carrying on any trade or business in this state, and any corporation created under general or special laws, foreign or domestic, and exercising public or private franchises therein, are hereby forbidden from requiring or demanding of or from any servant or employee, on any condition whatever, the surrender in writing or by parol, or the abandonment or any agreement to abandon any lawful right or privilege of citizenship, public or private, political or social, moral or religious, and whoever violates the provisions of this act shall be deemed guilty of a misdemeanor and upon a conviction shall be fined in a sum not exceeding one hundred dollars (\$100) and shall stand committed to the common jail of the proper county until such fine and costs of prosecution are paid, or in lieu of such fine the proper court may in its discretion sentence the convicted party to imprisonment in the county jail of the proper county for a term of not exceeding ninety (90) days.

Sec. 2. The president, the vice-president, secretary, general superintendent or other principal officer of any such partnership, association or corporation, as is named in section 1 of this act, who may direct or be a party to the violation of the provisions hereof, shall be taken and deemed as persons with-

in the meaning thereof and shall be held liable in all courts and places for a violation by such partnership or corporation of the provisions thereof.

Sec. 3. Municipal courts and justices of the peace shall have and possess jurisdiction to hear, try and determine all offenses under this act, reserving to the convicted party the right of appeal as provided by law in case of misdemeanor: and it is hereby made the duty of county attorneys in their respective counties to prosecute all violations of the provisions of this act whenever brought to his notice, and a refusal or neglect to so prosecute shall be cause for his removal from office as in case of willful neglect of official duty.

Sec. 4. All acts and parts of acts inconsistent with this act are hereby repealed.

Sec. 5. This act shall take effect and be in force from and after its passage.

It is merely a coincidence; but let me call the attention of the readers of this to the fact that on the same day "H. F. 86" became a law, the superintendent of the T., A. A. & N. M. R. R. ordered his engineers and firemen to either leave the Brotherhood or the service of the company. And yet people wonder why we have anarchy!

There is no reason on earth why we can not place upon the statutes of these United States, and of the several states, laws that are equitable, and not altogether for the interests of the plutocracy, except the fact that there are men (?), who toil for their bread, who are so wrapped or rapt up in their employer's interest (or perhaps rapped) that they will "knife" each other; and it takes mighty little "knifing" to kill a measure before a legislature.

In this connection let me relate the success of our "Three year bill" in St. Paul, at the present session.

The bill was introduced by Judge Fleming, of Brainerd, and was ably handled in the house, passing that body with 93 votes for, and one against it,—58 votes being required to pass a measure in the house. It went to the senate and was referred to the Railroad committee; which, by the way, is one of the fairest committees of either body. We were there met by the following named persons, claiming to represent the Machinists' International Union:

Geo. H. Boyd, C. M. & S. P. shops, Minneapolis. (Mr. Boyd, it is fair to state, was prominent in the organization of the Railway Employees' club (?) in Minnesota, several years ago.)

Mr. McCrea, Great Northern shops, St. Paul.

Mr. Hedge, Great Northern shops, Barnesville.

Mr. Bailey, Northern Pacific shops, Brainerd.

Mr. Anthony, C. M. & St. P. shops, St. Paul.

Mr. Hale, Omaha shops, St. Paul.

These men claimed that this was a direct slap at machinists; in the face of the fact that there is not a road in the country, having a contract with its firemen and engineers, but what has a clause governing the hiring of engineers or promotion of firemen. And

they could not deny that they were already shut out from the additional fact that master mechanics know, from experience, that machinists do not make good runners, without long terms of apprenticeship at the scoop. We beat them on every logical point; but they showed their true colors, and demonstrated that the corporations had played the well worn dodge of getting one labor organization to club another with. In my report, to the lodge of Minnesota, I shall relate this piece of history in detail.

Ernest B. Mayo.

MINNEAPOLIS, MINN.

## THE IMPORTANCE OF MORAL CULTURE.

MR. EDITOR:—The following will be enthusiastically received by labor and the friends of labor the world over:

The greatest task that lies before Christian civilization to-day is a mission to millionaires. If that mission is not attempted, or if being attempted it fails, there will be of necessity early in the twentieth century the nationalizing of these millions. The mission to the millionaire is imperatively called for alike in the interest of the millionaires, who are perishing, stifled by their millions, and of society, whose institutions languish for lack of nutriment for their sustenance. If that mission is successful the millionaire may still be ransomed. If it fails, the millionaire is lost. He may still be a rich man; but his millions will pass from his hands into those of the nation at large. The fruits of his energy, of his genius in the fields of finance will go to the credit of the nation, which appropriates without hesitation the fruits of the energy, the industry and the genius of her captains in the field of war. The nation will not be ungrateful, it will pension its millionaires as it pensions its Marlboroughs for Blenheim and Ramilies and Oudenarde and Malplaquet, or as it endows its Wolseley for his Tel-el-Keblir. But it will no more dream of allowing them to bequeath their millions than of allowing Lord Wolseley to regard Egypt as his personal property, or recognize the right of the heirs of the Duke of Wellington to the fee simple of France.—*W. T. Stead in Review of Reviews.*

In the meantime, a mission has already been inaugurated to free the working man from the slavery of pernicious habits and ruinous excesses; such as excessive indulgence in smoking, drinking, eating and the frequenting of brothels and gaming dens.

Workingmen are beginning to recognize the importance of economical habits; are beginning to see that life is what we make it; are beginning to recognize the value of the following axioms:

"He who striveth for the mastery is temperate in all things."

"Human health and happiness is dependent upon the natural exercise of our physical, mental and moral powers."

As workingmen become impressed with the importance of a higher mental and moral culture, the necessary conditions for universal peace and plenty will rapidly follow through the influence of federation of labor organizations.

What we need is level headed lecturers to

awaken interest in this subject among working men and leaders of labor organizations. We also need the organization of a new society under the banner "Friends of Labor," composed of all persons who are willing to use their influence in the cause. Make the conditions for prosperity, and prosperity will come.  
J. D. Lawrence.

## THEY BEAT LIFE INSURANCE MEN.

"Wal," said the old man, "I never did see such a funny thing. You see, a life insurance agent came into a railroad office where I was tryin' to make rates for a carload of hosses, an' the first thing he done was to try to bunco the agent out of \$10,000 of insurance. Well, I listened for a while an' then began to take some interest in the matter. It seems that the man was examinin' doctor, an' he talked tontine and semi-tontine, an' endowment, an' old line and all such things as that, an' then he gave the man a little chance to rest. An' then the agent got in his work, an' gol darn me, if he didn't do the life insurance agent to the queen's taste. He sorter kinder refused to talk about insurance, but began ter speak about the benefits of foreign travel, an' before he had spoken for more than half an hour he had sold the life insurance man a ticket to Europe and return at the highest price on the market. I'm a hayseed, but I'm up to snuff, and dern my hide if I don't think those railroad men beat the life insurance men every time,—*Minneapolis Journal.*

# GRAND LODGE.

## ASSESSMENT NOTICE FOR MAY.

OFFICE OF THE GRAND LODGE, B. OF L. F.,  
TERRE HAUTE, IND., May 1, 1893. }

ASSESSMENT No. 37, \$2.00.

### To Receivers of Subordinate Lodges:

SIRS AND BROTHERS:—You are hereby notified of the death and disability of the following members entitled to all the benefits of the order, viz:

CLAIM No. 939. Joseph H. Miller, of Cleveland Lodge, No. 450, was declared totally disabled by Loss of Leg, November 2, 1892.

CLAIM No. 940. Edward W. Briggs, of Truckee Lodge, No. 19, died from a Tumor, January 16, 1893.

CLAIM No. 941. George Jones, of Progress Lodge, No. 105, was declared totally disabled by Loss of Leg, January 24, 1893.

CLAIM No. 942. John L. Hanrahan, of Liberty Lodge, No. 242, died of Bright's Disease, January 25, 1893.

CLAIM No. 943. James M. Watts, of Mecklenberg Lodge, No. 457, died from Scalds, January 27, 1893.

CLAIM No. 944. John Graham, of Key City Lodge, No. 106, died from injuries received in a Collision, January 27, 1893.

CLAIM No. 945. James G. Price, of Plain City Lodge, No. 238, was killed by Railway Accident, January 28, 1893.

CLAIM No. 946. George W. Frisbie, of Garden City Lodge, No. 50, died of Malarial Fever, January 30, 1893.

CLAIM No. 947. Charles W. Hoffmeier, of Fleetwood Lodge, No. 424, was killed Coupling Cars, February 2, 1893.

CLAIM No. 948. Wm. H. Gaskell, of Snow Flake Lodge, No. 298, was killed by Railway Accident, February 7, 1893.

CLAIM No. 949. J. G. Rasbury, of Sunny South Lodge, No. 148, was killed by Boiler Explosion, February 8, 1893.

CLAIM No. 950. A. A. Conn, of Royal Gorge Lodge, No. 59, was killed by Railway Accident, February 12, 1893.

CLAIM No. 951. H. R. Smith, of Sunset Lodge, No. 177, died of Cerebral Meningitis, February 13, 1893.

CLAIM No. 952. John F. Connors, of Resurrection Lodge, No. 489, died from injuries received in a Railway Accident, February 15, 1893.

CLAIM No. 953. Frank L. Chapman, of Emporia Lodge, No. 53, was Run Over and killed, February 17, 1893.

CLAIM No. 954. Homer G. Andress, of Marble City Lodge, No. 353, was killed by Railway Accident, February 17, 1893.

CLAIM No. 955. Edward Cotter, of Central Park Lodge, No. 237, was Run Over and killed, February 18, 1893.

CLAIM No. 956. Joseph H. McIntyre, of Pike's Peak Lodge, No. 218, was killed in a Collision, February 18, 1893.

CLAIM No. 957. J. T. Williams, of Custer Lodge, No. 191, died from injuries received by Falling from Engine, February 20, 1893.

CLAIM No. 958. Chas. A. Gallagher, of Fairmount Lodge, No. 333, died of Typhoid Fever, February 21, 1893.

CLAIM No. 959. Casper Medwig, of Columbia Lodge, No. 252, was Run Over and killed February 28, 1893.

CLAIM No. 960. Alex H. Rogers, of Gilbert Lodge, No. 240, died of Peritonitis, February 28, 1893.

CLAIM No. 961. George W. Thain, of Boston Lodge, No. 57, was declared totally disabled by Paralysis, March 2, 1893.

CLAIM No. 962. Dan'l Dungey, of Long Doubler Lodge, No. 334, was declared totally disabled by Compound Fracture of Hand, March 4, 1893.

CLAIM No. 963. Thomas H. Meredith, of Guide Lodge, No. 125, died from injuries received Jumping from Engine March 7, 1893.

CLAIM No. 964. Wm. J. Turney, of Rochester Lodge, No. 99 was declared totally disabled by Paralysis, March 8, 1893.

CLAIM No. 965. Dennis McMahon, of Folwell Lodge, No. 526, died of Typhoid Fever, March 10, 1893.

An assessment of TWO DOLLARS (\$2.00) has been levied for the payment of the above claims, and you are required to forward said amount for each member whose name appears on the rolls of membership MAY 1ST, 1893 (also for all members having taken a withdrawal (limited or final) after MAY 1ST, and for all members who died or were totally disabled since that date), said remittance to reach the Grand Lodge not later than MAY 20TH, 1893, as provided by Section 50 of the Constitution. Any lodge failing to make returns as above provided will stand suspended from all the benefits of the order, as per Section 52 of the Constitution.

Yours fraternally,

F. F. SARGENT, G. M.

### LABOR AND LEGISLATION.

---

Thoughtful workingmen are considering in what regards, and to what extent, labor can be benefited by legislation. But before we come to the consideration of legislative action, other matters preliminary to such questions demand attention.

In the first place, as workingmen we are to consider in what measures laws are required to secure for labor simple justice, because justice to labor works no wrong to society, but, on the contrary, promotes the general welfare, while injustice to labor is in every instance productive of general injury—necessarily so, since labor is the great force and factor in promoting the public welfare. Any injustice to labor is wide spreading and far reaching. Labor, contented and prosperous, measures the progress and prosperity of communities everywhere; while labor, discontented and impoverished, marks decay and retrogression in all branches of business.

Labor, having investigated conditions and arrived at conclusions relating to such laws as are required to correct prevailing wrongs, should be able to unify its forces for the purpose of securing the election of men of first-class capabilities to champion its measures in legislative bodies. If at this juncture there is division and faction, failure is inevitable, regardless of the justice of the measures proposed, the wrongs complained of, or the rights which labor ought to secure.

The fact ought to be recognized, and have weight, that comparatively few men are successful legislators. There are men in the ranks of organized labor in all regards capable of being law makers, but they are few in number and far between in location. This is not the result of mental incapacity, but is owing to the fact that workingmen have had, as a general proposition, neither the time nor the opportunities for study and mental discipline required to equip them for preparing bills embodying their demands, in matter and language required in statutes which must be constitutional in their provisions, and so constructed as to challenge the acumen of lawyers when appealed to, for the purpose of affording labor the relief it demands. Hence we infer that in selecting men to represent labor in legislative bodies, two prime questions should be considered: first, are the men the ardent, uncompromising friends of labor? second, are they fully equipped by native ability, education and experience, to legislate—that is to say, to frame measures legal in form, free from ambiguity, and which if enacted into laws will accomplish the purpose for which they were enacted?

We are confident labor is making serious mistakes in this matter of legislation, by electing men who, however well meaning and honest, are sadly lacking in equipment, as law makers. They are always at the mercy of others. They propose measures they do not construct and are therefore incapable of analyzing them. They do not comprehend the intricacies of phraseology nor discover lurking technicalities. Wanting in legislative sagacity, amendments and provisos are injected, and when the bill becomes a law it is shorn of usefulness and labor pays all the penalties, or the bill finds its way into the custody of an unfriendly committee and by various subterfuges is placed where it cannot be reached, because its friends were incapable of applying such forces as experience and capability could wield to overcome opposition.

Viewing matters from such standpoints, what would seem to be the essential requirement? Manifestly, for labor to concentrate its votes upon the friends of labor whose qualifications for legislators are admitted, regardless of any connection with labor organizations. They need not necessarily be lawyers, but most certainly if they are lawyers so much the better, as lawyers are best equipped for framing laws; they, more readily than others, discover defects in bills; they

are the best judges of phraseology, and know when a bill meets the demands of labor. Besides, there are to be found, everywhere, lawyers who are in profound sympathy with labor and who know the wrongs to which it is subjected, and are the best judges of legal remedies. Ordinarily, lawyers are equipped for presenting to deliberative bodies the strong points of a measure, and are trained to detect and expose the strategic movements of opponents, and as legislators, shape all laws. Hence, as the advocates of labor measures, they become of great value.

In these times no labor bill that touches in any way the assumed prerogatives of employers and corporations, can be introduced into legislative bodies without arousing fierce hostility. Money has its henchmen in these bodies, and throngs of them, as lobbyists, men who are selected, if representatives, because for a consideration they will "sell out." They are known to have their price, like certain witnesses who swear for their clients, shaping their statements without reference to truth but in a way to escape the penalties of perjury. To expose these debauched creatures or to render their schemes powerless has become one of the supreme duties of legislators who are governed by principle—not always nor indeed at any time an easy task—and labor in a special sense needs such men to champion its measures, and the lack of their assistance accounts to some extent for the slow progress labor legislation is making in the country.

Labor deems it prudent to have what it calls "legislative boards," to see that certain measures are introduced and to watch their progress. These boards constitute lobbies, and by their operations often do more harm than good, and serve directly to create opposition lobbies made up of shrewd and unscrupulous men, whose operations cannot be as severely criticised as they deserve, because labor, having a lobby, is required to remain silent. As a result, in the battle of lobbies labor generally suffers defeat.

In such cases labor is in the habit of saying, by acts if not by words, and often by declarations, that the enemies of labor, or those who oppose labor measures in legislation, will be watched and defeated when again they are proposed for legislative positions. To say the least of it, such intimations of reserved penalties are not wise; reticence as to what labor will do, or not do, would be preferable, since in scarcely any given case can any one foretell what labor would do. It seldom

unifies—far more frequently splits and factionizes. Labor boards for legislative purposes could be prudently reduced in number with a prospect of more favorable results.

In so far as the future welfare of labor depends upon the enactment of wise laws, we feel satisfied labor must, in several essential points, change its program; men must be found, first and foremost, who are capable; nothing in such positions condones ignorance and inexperience, however honest the representative of labor may be. The time has come when the champions of labor in legislative bodies must be not only earnest and honest, but so admittedly intelligent, so sound in legal lore and strategy, that whether in committee or on the floor they will be found the equals in all regards of the enemies of labor. To be watchful in these regards means future victory for workingmen. To neglect them is to insure defeat.

---

## LABOR LAWS OF THE VARIOUS STATES AND TERRITORIES.

---

Hon. Carroll D. Wright, commissioner of the national department of labor, has compiled a volume of 603 pages, giving abstracts of the labor laws of the various states and territories and the District of Columbia. The compilation includes other valuable information, as for instance a statement relating to the sessions of legislatures, whether held annually or biennially, the various holidays of each state, and much other matter bearing upon the interests and welfare of labor. The commissioner says:

Questions have arisen from time to time in the progress of this work as to what classes of legislation could be said to have such a bearing on the general subject of labor as to warrant their inclusion therein. Many laws have been enacted, particularly in recent years, designed directly to affect the subject of labor in many of its various phases. These laws have, of course, been included. There are, however, many laws on the statute books not designed to be distinctly labor laws, but to be of a more general application. Still, in their actual application, many of these laws would seem to affect the laboring classes more than others, or at least to have a bearing upon the conditions of the laboring man. A good example of this class are the exemption laws. Such laws may be deemed to have a place in any compilation of laws designed to illustrate

the state of legislation bearing upon labor, and the intention has been to include all such laws in the compilation.

In noticing this exceedingly important compilation of labor laws of the various states it is impractical for us to much more than call the attention of readers to its great value and to urge upon them to obtain a copy if possible. It should be in every man's library who is ambitious to keep abreast of passing events in the ranks of labor.

Legislation which directly affects railroad employes, has been enacted in a number of states; as for instance, in Florida, Georgia, Iowa, Kansas, Massachusetts, Minnesota, Montana, Ohio and Wisconsin, laws have been enacted making railroad corporations liable for injuries to employes. These laws are somewhat different in verbal construction, and in some states, for instance Ohio, the law is severely specific. The Florida law is as follows:

Sec. 2. If the person injured is himself an employe of the company and the damage was caused by another employe and without fault or negligence on the part of the person injured, his employment by the company shall be no bar to the recovery, and no contract which restricts such liability shall be legal or binding.

The law of Georgia is practically the same as that of Florida; indeed, in the states named, the purpose of the legislation seems to have been to remove by statute the common law practice and give to injured employes a chance to be heard in court.

Laws relating to railroad strikes have been enacted in eight states, viz.: Connecticut, Delaware, Illinois, Kansas, Maine, New Jersey, Pennsylvania and Wisconsin. In Delaware the law prohibits, under penalty, any engineer from abandoning his engine at any, except schedule or otherwise appointed destination, provided such abandonment is to aid a strike. The Illinois law is similar to that of Delaware, and the same is true of the other states. There are three states, viz.: Indiana, Maryland and Ohio, which have laws forbidding railroad corporations from levying forced contributions upon their employes.

Georgia has a law relating to the qualification of telegraphers.

Indiana, New York and Georgia have laws making stockholders liable for debts due employes.

Alabama, Massachusetts and Ohio have laws relating to color-blindness of railroad employes.

Ohio has a law making ten hours a day's work for railroad employes; all hours over ten to be paid for extra.

Texas has a law which punishes with fine and imprisonment any one who intimidates a railroad employe.

Massachusetts has a law which punishes railroad employes for negligence.

New Jersey has a law punishing employes for disobedience of rules.

Michigan and New York have laws prohibiting the employment of intemperate persons in any department connected with the train service of railroads.

Missouri and Texas have laws requiring railroads to give thirty days' notice of reduction of wages.

New York has a law requiring railroads to provide their trains with safety appliances.

Indiana has a law prohibiting the discharge of employes because they belong to a labor organization, as also a co-employe law which enables an employe if maimed to sue employer and get his case into court, or if killed, enables him to sue for damages.

It requires particular fortitude and hard work to get a law enacted favoring railroad employes or other classes of workingmen, but when they conclude to unite for the purpose of securing justice by legislation, they may hope for success.

---

## ANTI-POVERTY.

An English university man, a citizen of London, Dr. Stanton Colt, recently delivered a lecture before the Ethical Society of St. Louis, the subject being "Life Among the Poor and Lowly." It appears that there is an organization known as the "University Settlement," a little colony of university men who are studying the conditions of the labor problem and of the poor. In the course of his lecture, Dr. Colt said:

The problem of poverty to-day is as critical an issue as the problem of slavery before the war. There is a special obligation on all people of wealth and leisure to attempt to solve it. It never can be solved by the hard, over-worked laboring classes alone. They haven't the time or the means of acquiring a knowledge of the problem in all its bearings. It must be studied out just as Wendell Phillips, William Lloyd Garrison and hundreds of others studied the anti-slavery question. But it is no easy matter for men of education

**and wealth** to get into actual touch of the needs and aspirations of the working people. The working people have suspicions against any one of the capitalistic class. The recognized working leaders have a monopoly of the working movement, and they mean to keep it. It would only require a few years of earnest and intelligent devotion on the part of any educated man of wealth in order to secure for himself general confidence.

We surmise that Dr. Colt is a wealthy university Englishman, who has concluded to do missionary work among the poor of America, finding nothing to do in that line at home, for instance, in London. It will be observed that Dr. Colt is of the opinion that the labor problem will never be solved by the laboring classes of America, and that if solved at all it must be done by "educated men of wealth."

Well, England has thousands of university men of wealth, they have dominated labor affairs for centuries, and it would be interesting to have Dr. Colt tell us in what particular educated men of wealth have solved any labor problem in England, or anywhere else in the world.

Dr. Colt places the labor problem and the African slavery problem on a par. In this he exhibits himself anything else but a student of the subject he discusses. In England there has been some advance made in ameliorating the conditions of labor, but not by educated men of wealth, not by university men, but by workingmen themselves in defiance of educated men of wealth. University learning and labor were never in alliance in England or in America. And what is unspeakably shameful in history is, that as soon as some workingman, by hook or by crook, becomes a man of wealth, he becomes, as a general proposition, a contemptible snob. As a result, whatever is done, or is hoped to be done in the way of solving labor problems, must be done by labor, and in America the outlook is far from being hopeless.

It is a great mistake to suppose that the labor problem and the old negro slave problem have anything in common, they are not parallel problems. In the United States neither white men nor black men are chattels, they are not bought and sold at auction. And while there are educated men of wealth, university men, who seek to degrade workingmen, workingmen, thank God, may, if they will, teach the "capitalistic class" that while any friendly act on their part will be acceptable, they will not be permitted forever to block the way labor maps out to solve problems in its own interests.

It is well said by Dr. Colt that "the working people have suspicions against any one of the capitalistic class." Why such suspicions? It is easy of explanation. The reason is found in the ceaseless hostility of the capitalistic class toward the working class. It is shown when an effort is made to advance wages. It is shown when the proposition is to reduce the hours of work, the two important questions which relate to the solution of the labor problem. Advance wages to a scale of honorable living, and reduce the hours of toil, until mind and body may have time for rest, and the labor problem will be practically solved.

Dr. Colt says:

The special means which should be taken up and instilled among the working people by men of leisure are (1) sanitary and domestic questions; (2) sick benefit societies based upon sound insurance principles; (3) co-operative stores for the distribution of all the commodities of life, so that the profits of the petty retail dealer may accrue to the consumers themselves; (4) trades unions which should be organized universally among unskilled labor, and among women who work for wages, in order to keep wages up to the proper standard, secure shorter hours of work, etc.; (5) the organization of the leisure hours of workmen for innocent and refining recreation, and for intellectual improvement. These measures afford a definite and conservative policy for men and women of leisure to carry out. They attack the evils of poverty from five different points of view and each one affords a specific remedy for specific evils. They afford more than a mere palliation for the present conditions of poverty, pauperism, crime, intemperance and kindred evils.

The foregoing is well enough in its way, but the propositions are not new. Workingmen long since formulated and began acting upon them, and in numerous instances have carried them into practical operation.

Dr. Colt's mission should be to a class of capitalistic employers whose policy is to rob labor and thereby degrade labor; facts which labor fully comprehends, and the purpose of labor is to change the programme. When labor obtains fair wages, all "sanitary and domestic questions" will be settled without the aid of university men. Sick benefits were long since provided for by organizations of labor. "Co-operative stores" have not been overlooked by workingmen, and as for "trades unions," the country is full of them. It may be that Dr. Colt has a mission, but we are persuaded if such is the case, it is not to workingmen in America; and we are convinced, if he is the philanthropist he professes to be, that he could find employment for his talents in London in rescuing thousands from starvation, filth and degradation.

## ORGANIZED LABOR AND THE WORLD'S FAIR.

The MAGAZINE, from the start, sought by facts and arguments, to stay the tide of fanaticism which we believed would work only evil and that continually if it continued to flow.

The MAGAZINE pointed out, as best it could, that viewing the Fair on Sundays could not, by any possibility, be tortured to appear as disrespect for the "Christian Sabbath;" that by no sophistry could it be shown that viewing the highest achievements of art and skill was Sunday desecration. On the contrary, we sought to demonstrate that spending Sunday in contemplating man's handiwork was some thing akin to worship, and would be fruitful in sublimating results upon the minds of beholders.

Incidentally, we sought to show that closing the Fair on Sundays would deprive workingmen and their families of enjoyments which could not be obtained on other days of the week without making great sacrifices, and that thus the Fair would be a failure in a most important regard, since thousands who stand especially in need of its educating influences would be unable to visit it, and spend the necessary time to take in all of its wonderful exhibits. But the fanatics gained the day, apparently, and felicitated themselves accordingly.

Now, then, comes the first note of warning to the Sunday closing fanatics. Organized labor in Chicago has determined to have one day untrammelled to visit the Fair and as this, under present conditions, cannot be Sunday, it must be some other day to be decided upon—probably Monday. The movement is general and arrangements will be made in that direction, as a result. In Chicago, men will work all day on Sunday that they may attend the Fair on Monday. In commenting upon the subject the *Chicago Herald* says:

As already stated in the *Herald*, organized labor has resolved to work Sunday and see the Fair one of the days the fanatics allow it to be open. Many employers have already agreed to shut down Monday and let their men go to the Fair the second day of the week, on condition that they work the first day, so that contract orders shall be finished on time. The Central Labor Union prefers Saturday as the rest day, but is equally ready to work Sunday in order that the men and their families shall have a day at the Fair. It is absolutely certain that Sunday work in Chicago during the summer is going to become a fact if the decree of fanaticism shutting labor from the Fair its present day of rest and recreation be held binding by the directors.

It is not to be doubted that the fanatics will seek to utilize some

Sunday law relating to labor on Sundays, and thereby seek to keep workingmen away from the Fair, but if the movement is of the magnitude the *Herald* outlines, the herculean task of arresting it will not, in all probability, be undertaken. On the contrary, such a spontaneous uprising of workingmen to do a laudable thing will be exceedingly difficult for the fanatics to suppress. Commenting further upon the subject the *Herald* remarks:

The new board of directors must settle this question. On that board rests a grave responsibility. Is Sunday work to be witnessed in the factories and foundries, the carpenter shops, the tan yards, the lumber yards, the machinery works, the ship yards, the coal yards, the mills of this city? It will be indeed a humiliating and shocking spectacle. Which will honor Sunday more—these places now silent Sunday resounding with the roar of labor, the Sabbath heavens darkened by their smoking chimneys, the children of the city taught an ineradicable lesson of broken rest and disturbed Sunday quiet—or the noble sight of these tens of thousands of wage earners in Jackson park Sunday with wives and children, educating themselves in all that tends to elevate, to refine and to make better?

Manifestly, as the *Herald* says, "Chicago is now face to face with the first real blow at Sunday rest. Will the directors of the Fair rise to their duty and throw away the insolent and selfish command that, by reason of the broken pledge of Congress, no longer binds them in law or in morals? Can they conscientiously consent that Sunday in Chicago shall become a day of labor?"

Fanaticism has done its best, and that is bad enough—narrow, ignorant and bigoted, it sees nothing distinctly, and is totally incapable of comprehending the question, which it assumes to understand, and unless a counter movement can be inaugurated by persons of common sense, Sunday in Chicago will be a labor day.

---

NEW YORK has a baby—the little Hammersley boy, now 8 months old—who is one of the richest babes in the world. If this little millionaire lives he will start out at 21 years of age the possessor of many millions of unmortgaged wealth. His aunt, the Duchess of Marlborough, is annually packing off thousands of income derived from the Hammersley estate and throwing it away on an old English duke and still cries for more, but the daddy of the boy demands that a halt be called and that neither duke, dukedom nor duchess shall impoverish the Hammersley estate.

## RUNNING A TRAIN FOR ROYALTY.

An exceedingly interesting account is published of Queen Victoria's rides on the rail. When the Queen of Great Britain and Empress of India concludes to go somewhere by rail, several days are required by the managers of the road to get things in the most perfect order. She not only has a palatial car, but always a special train; nor is this all, but her majesty has the "full run of the line" and everything has to be sidetracked.

When a railway corporation receives orders to transport the Queen from one palace to another, the first thing to be considered is to select the "driver"—the engineer. He must be a man that fills the bill in all regards, and when the choice is made no other testimony is required to prove that that particular "driver" is on the way to promotion.

Preceding the Queen's train is another known as the "Queen's pilot," an engine with no train attached, carrying the engineer, stoker and two inspectors, leaving a half hour in advance of the Queen's train. Nor is this all. When the Queen travels, an army of railway servants are everywhere distributed to see that nothing goes wrong. Plate-layers "have each an allotted span of track to keep in order, which they must constantly patrol until all is over. Brakemen of trains brought to a stand on adjoining lines carefully examine them and see that nothing is projecting. Every crossing is guarded by someone, and inspectors protect all occupied sidings. Signalmen, who, by the by, must only use their telegraph instruments for messages connected with the royal train, keep on the qui vive, and station agents appear on every platform. In bringing the train to a stand for the Queen to alight for refreshments the same order and precision are observed that characterize all the arrangements. A strip of carpet is laid on the platform, right along to the door of the refreshment saloon. The engineer has now an opportunity of exhibiting his driving as a fine art. With his hand on the brake handle he brings his speed down from forty-five to five miles an hour, but so gently as almost to defy detection in the motion. On he comes until he sees a chalk mark on the platform, and as he "toes the line" with his engine the door of her majesty's salon draws up right opposite the carpet pathway. Before starting again, the guards, of whom

there are two on the train, are all ears and eyes. The one in the front van must receive verbal information from the chief railway superintendent that the train is ready to go on, and then he has to exchange signals with the conductor in the rear and be assured by the station agent that all is right. After making sure that the members of the royal suite are all seated he waves his green flag or lamp, as the case may be, and the journey is resumed."

The Queen accepts no free passes. On the contrary, she pays \$1.75 a mile for the train, stipulating for first class fare for herself and retinue, and in all of her travels there is on record but one incident that created any anxiety in the cab—growing out of the fact that at a particular station an important signal light could not be seen, and the train had to come to a sudden standstill. Upon investigation, it was found that a swarm of bees had selected the lamp for a resting place, and their number was so great that they had put out the light. The Queen being informed of the incident, was highly delighted and regarded it as a good omen. The busy bee had become identified with the Queen's journeyings, and she always refers to it in honeyed phrase, making witty allusions to the queen bee—the Empress of India's flora.

---

HENRY CASE, of Gloversville, N. Y., will send to the World's Fair the smallest locomotive ever built to be run by steam. The engine "runs by steam upon a circular track 10 feet in diameter. The principal dimensions of the little engine are: Weight,  $1\frac{1}{2}$  pounds, with tender 2 pounds  $2\frac{1}{2}$  ounces; length,  $8\frac{1}{2}$  inches, with tender 12 inches; height,  $3\frac{1}{2}$  inches; gauge of track,  $1\frac{3}{8}$  inches; diameter of cylinder, 5-16ths of an inch; stroke of piston,  $\frac{1}{2}$  inch; stroke of valve, 1-16th of an inch; diameter of drive wheels,  $1\frac{3}{8}$  inches, and diameter of truck wheels,  $\frac{1}{2}$  inch. The materials used in this midget locomotive are solid gold, silver, steel and brass. There are 1,815 pieces, exclusive of screws, bolts and rivets, or in all 2,836 pieces."

## MONOPOLY RENT.

---

BY WILFRED P. BORLAND.

---

I have, on numerous occasions, through the columns of this MAGAZINE, called attention to the importance of obtaining clear and precise definitions of economic terms, especially when it is sought to carry the idea to which the term gives expression into exact reasoning. An excellent illustration of the ambiguities that are sure to occur when this plan is not followed out is furnished by the two articles which lately appeared from the pen of Mr. Ward.

Mr. Ward's later articles go to show that the development of our controversy has been attended by the introduction of many purely verbal issues which might, to a great extent, have been avoided had we taken the trouble, in the first instance, to arrive at a clear understanding of the meaning of the term "economic rent."

As it is, Mr. Ward has been reasoning from one understanding of the term while I have been reasoning from another, with the consequence that neither of us has been able to make his reasoning appear logical to the other. Now that we are at one as to the meaning of the term "economic rent," we shall have little difficulty in arriving at a clear understanding of our real points of difference.

My understanding of "economic rent" has always been the rent which arises naturally by reason of free competition for land of given conditions, which idea is expressed by the Ricardian formula; it is this idea I have always had in mind whenever I have used the term "economic rent." Whenever I have desired to express the present rent of society I have either used the term "speculative rent" or so otherwise qualified the term "rent" as to leave little doubt as to my meaning, as Mr. Ward may easily discover by referring to my published utterances.

Although I believe "speculative rent" to be the better term, I shall, in deference to Mr. Ward, adopt the term "monopolistic rent" in its stead as expressing all that portion of the present rent of society which is in excess of the purely natural or "economic rent." From this new standpoint I imagine we shall experience little difficulty in arriving at the real meat of our controversy.

Before proceeding further, I want to say that the claim that single taxers do not distinguish between economic and monopolistic rent, and that their intention is to confiscate any portion of monopolistic rent under the complete operation of the theory, is really the silliest objection the opponents of the theory have ever advanced. The fundamental thesis of the single tax economy is that the very first

effect of its application would be to utterly destroy monopolistic rent, leaving nothing but the pure economic rent of society upon which to levy the tax.

This thesis is well understood by all thorough single taxers; it has been amply proved, and I can assure Mr. Ward that if such were not the case the single tax economy would possess very few charms for me.

It now becomes necessary for me to quote the two propositions contained in Mr. Ward's article which appeared in the May MAGAZINE as being the basis of our controversy, namely:

1st. That non-occupying landlordism is responsible for the absorption by individuals of monopolistic rent.

2nd. That were use and occupancy the only valid claim or title to land, that in the case of lands occupied for income producing or profit making businesses, competition would entirely eliminate monopolistic rent, leaving only pure economic rent attendant upon relative advantage of business locations. These propositions I affirm and Mr. Borland denies."

With his new understanding of the term "economic rent," I wonder that Mr. Ward's sense of justness and fairness permitted him to advance these propositions in such a way as to create the impression that they are the identical ones he has all the time been engaged in defending, and which I have denied. The propositions which Mr. Ward has heretofore been engaged in defending refer wholly to economic rent. It is not necessary to occupy space by quoting these propositions here; they may be found on page 788 of the MAGAZINE for 1892 and will speak for themselves. I must say that the charge of quibbling comes with rather bad grace from one who employs such methods of controversy. It is impossible, Mr. Ward, that I should deny propositions which have never been affirmed.

Mr. Ward also occupies over two pages of space in the vain endeavor to create an issue with me over my remarks concerning "Gresham's law." He goes into an extended argument and introduces a mass of figures—with which I am just as familiar as he is himself—all for the purpose of proving—what? Not that "Gresham's law" is erroneous in its statement, but simply that it is erroneous in its application, which was the exact point I tried to elucidate myself; my language that the application of the law "is a disgrace to humanity" is sufficiently emphatic and not to be misunderstood.

The work in which we are commonly engaged, Mr. Ward, is one of vital importance; it is the elucidation of ways and means for the complete regeneration of society. We cannot afford to occupy ourselves with setting up men of straw merely for the purpose of knocking them down; we cannot afford to allow any petty feelings of egotism and false pride to stand in the way of a calm, clear and candid discussion of such ways and means. The real issue upon which our controversy hinges is both valid and vital, and I candidly assure Mr. Ward that if there has been any attempt to obscure such issue it has not, consciously, originated with me; my attempt has been to place the issue in the clearest and plainest light possible.

Now, let me say that I am not one of those "limited" single taxers; I have never believed that the masses should only be fed with truth "on the half shell;" that idea has obtained all through human legislation so far, and it is time it was relegated to the rear. What we need is something more than a mere fiscal reform; what we need is a reform that will render it possible for every man to enter the race for life handicapped by no disadvantages other than those obvious and natural ones which the Creator has implanted in his nature; what we need is a reform that will permit every individual to expand and grow to his full height surrounded by an atmosphere of freedom; what we need is to secure for the masses—something they have never yet had in the long and dreary annals of human history—a chance for each one of them to develop his individuality on a par with every other one. Such a reform I believe the single tax, logically carried out, to be. When it has failed of its mission, then will be time for those who prate of the anarchy of individualism to come forward with their vast and intricate schemes of governmental repression; then will it be time to replace the sentiment "I ought not" with the sentiment "thou shalt not;" then will the triumph of individualism indeed be a by-word and a reproach to the civilization which witnesses the failure.

Now, let us see about the points of difference between Mr. Ward and myself:

That monopolistic rent is an indirect tax upon consumption, is a proposition I have never sought to deny; first, because it has never been affirmed, and I have, therefore, had no chance to deny it, and, second, because I have no wish to deny it while knowing it to be true.

Mr. Ward's assertion that my effort has been "to demonstrate that monopolistic rent could continue to exist in the absence of non-occupying landlordism" is unauthorized by anything I have ever written, and is extremely silly when considered in connection with the diagram and the reasoning thereon which appeared in the *MARCH MAGAZINE*. I hope Mr. Ward does not consider me so great an ignoramus as to be unable to perceive the logical consequences of my own affirmations.

My reasoning on the non-occupying landlordism proposition has all along been to show that its abolition would be to cause the abolition of monopolistic rent, leaving economic rent intact. On this point, Mr. Ward may refer to my article in the *MARCH MAGAZINE*, also to page 1070 of the *MAGAZINE* for 1892.

My objection to the use and occupancy theory is that its application would be an improper settlement of the land question, because it would still leave economic rent to be absorbed by individuals, thus endowing some men with special privileges and permitting a disequilibrium of advantages within the social structure. Mr. Ward relies upon the compensatory action of a graduated income tax for restoring the equilibrium which he thus, tacitly, admits would be destroyed, while I regard the income tax as both cumbrous and in-

efficient in the presence of the simpler method of putting economic rent where it belongs in the first instance.

Now, in his May article, Mr. Ward concedes the fact "that there would yet remain a small degree of economic rent, were use and occupancy the only title to land." That is all I shall ask him to concede just at present. Let us now look at the other phase of the controversy:

The statement that I have tried to confine the argument to agricultural lands is false; it is a haphazard assertion made without any regard for the facts. My reasoning has always applied to *land*, without reference to where it may be situated; I have approached the subject with a full understanding of the fact that the law of rent is as fully applicable to urban as to agricultural communities (see page 692 of the MAGAZINE for 1892). But when introducing examples to illustrate my reasoning I have invariably selected such examples from urban communities, for the reason that the influences which operate to create value in land are there the more strongly marked.

Now, the real issue between Mr. Ward and myself is this:

I assert that under the complete operation of the single tax the monopolistic rent of society would be forced out of existence, leaving nothing but economic rent upon which to levy the tax; that under this condition it would be impossible to distribute any portion of such tax over the area of consumption because the conditions which permit the artificial manipulation of prices would no longer exist; price—under the influence of the interaction of economic forces brought out by absolutely free competition and the unrestricted operation of economic supply and demand—must always revert to, and be governed by the natural, which is the actual cost of production at the natural margin where rent does not exist. Rent can, therefore, only appear on land where the cost of production is less than at the margin and thus becomes an effect of price instead of one of the causes. Let it be understood that, in the economic meaning, production is considered to cease only when the product is in the hands of the consumer; any analysis of rent which attempts to consider the productive and distributive industries as apart from each other is both illogical and unscientific. Mr. Ward's contention is that the complete operation of the single tax would fail to destroy monopolistic rent; that such rent would still continue to exist and operate, as now, to exert an abnormal effect on prices and become an unjust source of income for individual members of society. Mr. Ward does not deny that this monopolistic rent would better be used to defray the expenses of government than to enrich individuals, but contends that because it is now an indirect tax on consumption it would continue to so be, and he offers as the better solution of the question the untaxed use and occupancy idea. Now, so far as my understanding goes, there is no very serious difference between us as to the effect of monopolistic rent; our whole argument, therefore, turns upon the question of whether or not the single tax will destroy monopolistic rent, Mr. Ward assuming the negative of the question

and I the affirmative. I have all along supposed that Mr. Ward was familiar with the fact that, in my elucidation of the laws governing price, rent, etc., I have followed the economic method, which sets friction on one side and always supposes conditions of freedom; my supposition has led to some misunderstandings which I hope may be avoided in the future.

Now, obviously, the single tax theory must stand or fall by the consequences of its own logic; neither Mr. Sullivan's assertions as to Mr. George's intentions, nor Mr. George's intentions themselves, can alter the logic of the question by a hair's breadth.

Consequently, the introduction of quotations which refer wholly to what some person has asserted as to some other person's intentions or opinions, is somewhat out of place in a controversy concerning a particular theory, when such controversy may only be decided upon the merits of the theory itself. But, since Mr. Ward has seen fit to introduce such methods of argument, I must request space to introduce a quotation in rebuttal of Mr. Sullivan's assertions:

We have hitherto assumed, as is generally assumed in elucidations of the theory of rent, that the actual margin of cultivation always coincides with what may be termed the necessary margin of cultivation—that is to say, we have assumed that cultivation extends to less productive points only as it becomes necessary from the fact that natural opportunities are at the more productive points fully utilized.

This, probably, is the case in stationary or very slowly progressing communities, but in rapidly progressing communities, where the swift and steady increase of rent gives confidence to calculations of further increase, it is not the case. In such communities, the confident expectation of increased prices produces, to a greater or less extent, the effects of a combination among land holders, and tends to the withholding of land from use, in expectation of higher prices, thus forcing the margin of cultivation farther than required by the necessities of production. \* \* \* \* \*

Whether we formulate it as an extension of the margin of production, or as a carrying of the rent line beyond the margin of production, the influence of speculation in land in increasing rent is a great fact which cannot be ignored in any complete theory of the distribution of wealth in progressive countries. It is the force, evolved by material progress, which tends constantly to increase rent in a greater ratio than progress increases production, and thus constantly tends, as a material progress goes on and productive power increases, to reduce wages, not merely relatively, but absolutely. It is this expansive force which, operating with great power in new countries, brings to them, seemingly long before their time, the social diseases of older countries; produces "tramps" on virgin acres, and breeds paupers on half-tilled soil.

In short, the general and steady advance in land values in a progressive community necessarily produces that additional tendency to advance which is seen in the case of commodities when any general and continuous cause operates to increase their price. As, during the rapid depreciation of currency which marked the latter days of the southern confederacy, the fact that whatever was bought one day could be sold for a higher price the next, operated to carry up the prices of commodities even faster than the depreciation of the currency, so does the steady increase of land values, which material progress produces, operate to still further accelerate the increase. We see this secondary cause operating in full force in those manias of land speculation which mark the growth of new communities; but though these are the abnormal and occasional manifestations, it is undeniable that the cause steadily operates, with greater or less intensity, in all progressive societies.—"*Progress and Poverty*," Book IV.

This language is sufficiently plain to any man of ordinary intelligence. Mr. George here recognizes the monopolistic element in our present rent fully, it seems to me; at least that is the impression I obtained upon my first study of "Progress and Poverty," and I have always retained such impression. I am not aware that Mr. George has subsequently used any language which is inconsistent with the above quotation from the very first of his books, and even if he has used such language the logic of the situation remains unaltered. The claim that Mr. George's intention was to perpetuate these monopolistic conditions is sufficiently shown to be silly when we remember that, in using the language quoted, he was diagnosing social disease, and he offered the single tax as a remedy.

Mr. Sullivan is a very able man, but it seems to me that in dealing with the single tax he follows the plan of his "Ideao-Kleptomania" and employs the argument *ad hominem* to a very great extent. His opposition to the single tax is probably honest enough, but it seems to me that his opposition to Henry George is so much greater than is his opposition to the single tax that he is blinded to the fact that the theory is altogether too broad to be confined within the narrow limits of any one man's personality.

Mr. Ward's rather extended quotation from "Protection or Free Trade" is not pat; it contains nothing whatever to prove what Mr. George's intentions are concerning monopolistic rent.

But this style of argument is obviously out of place in a discussion such as ours. Let us try and avoid it in the future.

When Mr. Ward asserts that the condition I illustrated by means of the diagram in the March MAGAZINE does not exist in the United States, he does violence to his common sense. If the condition does not exist, how comes it that we have any monopolistic rent? If the condition does not exist, then we have free competition for land of given conditions; the value of our land is regulated by actual supply and demand, and it is idle to say that such value is largely fictitious. But the condition does exist; I introduced one illustration from actual fact to prove its existence, and I could fill every page of this MAGAZINE with facts of the same nature. There is nothing anomalous in the depreciation of farm lands in this country; it is but the natural result of causes which, in the main, Mr. Ward has correctly stated.

Mr. Ward is correct in saying that natural price does not exist in the United States; he would have added force to the assertion by saying that it exists nowhere. As I have before remarked, "natural price is a price which arises under the free operation of natural laws, and as the cause essential to the stated effect does not exist, the effect cannot exist."

As Mr. Ward has ventured after my "economic scalp" with entirely the wrong weapon, it is unnecessary to occupy space with consideration of his argument; sufficient to say that did his argument refer to economic rent, it could easily be refuted by pointing out the very obvious fallacy of applying a rule to every one of those squares

within the line *a*, which he has deduced from observation of but two of them, which two are surrounded by exactly similar conditions, and which conditions cannot exist as to every one of the squares. I shall be delighted to have Mr. Ward prove the affirmative of his proposition that the withholding from market of the squares *b* adds nothing to the value of the residue of land within the lines *a*. He is rather overstepping the bounds of propriety when he calls upon me to prove its negative.

I have occupied so much space in the very necessary task of establishing our argument upon a correct basis that I do not feel at liberty to introduce arguments in proof of my affirmations at this time. I will merely ask Mr. Ward to refer to the code from the pen of our friend Gros, which appears on page 512 of the MAGAZINE for 1891, and say if he can see any room for the existence of monopolistic rent under the operation of the single tax administered by the provisions of that, or a similar code?

He may also derive much instruction concerning the distinction which all single taxers who understand the theory invariably recognize to exist between monopolistic and economic rent, by reading the article "Congested Civilizations"—also from Mr. Gros' pen—which appears on page 699 of the MAGAZINE for 1892.

I am convinced that Mr. Ward shall now regard the single tax in a somewhat different light, and I believe that, after due reflection, he shall be willing to admit that, in transferring his arguments from one set of propositions to another and entirely different set, without doing me the justice to believe that my interpretation of his original propositions might be different than his own, he has been guilty of a slight breach of the ethics of controversy.

---

## GRANDMOTHER'S SNOWBALL BUSH.

BY BESSIE MORGAN.

"Yes," said Miss Rebecca, "That was grandmother's bush. There aint a flower in my garden I think more of, than I do o' that.

When grandfather died an' the old house at the ferry was sold, I had it took up, an' brought it home an' set it out by the front door.

I don't see but it makes as good a show now, as it did the first time I ever saw it, for all it's such an old root, p'raps movin' it round so much has ben good for it.

When I think o' grandmother, I always 'member her as I see her one summer evenin', standin' pon the wide doorstep, by the snowball bush. 'Twas jest loaded with blossoms, from the topmost branch, that was higher 'n her head, down to the ground.

The sunset was shinin' 'cross the river, an' the robins was biddin' each other goodnight, up in the elm trees, an' grandmother stood there, with one o' the white flowers in her hand, lookin' off towards the west, with her soft, dark eyes.

She was a very handsome woman, even when I 'member her. Tall an' straight an' slim as a girl o' sixteen. Her hair was white like silver, but she kep' her black eyebrows, an' smooth pink cheeks. Her teeth was beautiful, an' she had the sweetest smile I ever see—an' the saddest.

Grandfather thought everything of her, he never was the same man after she died, he was jest bound up in her,—an' he had reason to be. She did her duty by him always, straight through to the end.

Fond o' him? O, I reckon so, in a quiet kind o' fashion. She'd liked another man better once, but grandfather knew all 'bout that.

Yes, I can tell you the story, child. My mother told it to me, an' Aunt Esther, grandmother's sister, told it to her.

Rachel Gaines, my grandmother's name was, 'fore she was married. She 'n Aunt Esther was all the children great-grandmother had. They lived up on Gaines' Hill. Grandfather owned 'most all the land up there, 'cept what belonged to Deacon North.

He was a dreadful stern man, Grandfather Gaines was; he 'n his wife believed in discipline, right down to the last point, an' they didn't have nobody to practise it on but those two girls.

Aunt Esther it didn't make so much difference to. She was lively an' high-spirited, an' goin' to do 'bout so, whether or no, but grandmother was a little, gentle thing. A look was all 'twas ever needed for her. Her heart was jest broke, if anybody she loved was put out with her.

Well, as I was sayin', they lived up on Gaines' Hill, and Deacon North lived right opposite to 'em, an' as they owned the hill 'tween 'em, they didn't have no other neighbors.

There was a large family o' the Norths, an' grandmother, an' Aunt Esther grew up with 'em. They was always runnin' back an' forth, jest like brothers an' sisters, folks thought—till Eugene North come over one evenin' to get leave to be engaged to Rachel.

Course it happened as such things are pretty likely to—in all that family o' Norths, an' there was five sons, 'sides the two daughters, Mary an' Ellen—there want one grandfather 'd had the slightest objection to but Eugene.

It want that Eugene was bad, he was a very likely young man indeed, but he want the sort grandfather 'proved on.

"Rollin' stones gether no moss," sez he.

An' Eugene wanted to travel an' see the world. He'd no idea o' settlin' down to farmin', a slavin' an' a savin' for the rest o' his days.

Ever since he was a boy he'd ben plannin' an' contrivin' how he could get off into some business that would give him a chance for what he wanted.

Rachel knew all 'bout his hopes an' ambitions, an' sympathized with him, 'cause she loved him. 'Peared to her, there might be more in life, than her father 'n mother thought, though if Eugene had only ben content to stay quiet at home, she'd liked it better.

Well, Grandfather Gaines, he told Eugene, he couldn't have Rachel unless he give up his sky-larkin' notions, an' settled down to somethin' stiddy. If he could get himself fixed so 'st he could keep a wife—Why, well an' good, but he'd got to be quick 'bout it. He couldn't have Rachel spendin' her life, waitin' round for no body.

'Twas jest 'bout this time Eugene got an' offer o' a position in a bankin' office, in one o' the southern cities. The offer was made through a friend, with the promise o' partnership later on, if he did well, an' Eugene was sure here was his chance.

Poor little grandmother cried her eyes out, but her father said 'twas the opportunity Eugene 'd ben sayin' he wanted, an' he'd better take it an' improve it.

Deacon North said the same, they didn't none of 'em have confidence in Eugene's plans. But 'twas agreed if he did well, an' got the partnership, in two years' time, he was to come back, an' marry Rachel, an' nobody wouldn't make no objections.

"Two years is forever," sez Rachel, when she was biddin' him goodbye.

'Twas in the summer, an' the snowball bush was there 'side 'em, hangin' jest full o' blossoms, lookin' handsome, I guess as it does now.

"O no dear, not so long as that," sez Eugene. He felt full as bad as she did, when it come to leavin' her, but he thought 'twas his only chance. He was sure he wouldn't never 'mount to nothin' if he stayed long there to home, an' he tried to encourage her, an' cheer her up.

"Sweetheart," sez he, "this bush won't have time to blossom but once more, 'fore I shall be back again. You must take good care o' it. We'll have 'em for your bridal flowers," sez he.

Rachel she tried to bear up, an' not make it any harder for him, seein's he'd got to go, but 'twasn't easy.

"It's so far away," sez she, "An' two years is such a long time. Are you sure you won't forget me, Eugene?"

Eugene looked down in little grandmother's face a minute, then he took it 'tween his two hands, an' raised it an' bent his own down to meet it.

"I reckon there aint much danger o' that, Rachel," sez he.

An' Rachel herself was 'shamed she'd asked him such a question.

She was a shy little thing, was grandmother, dreadful choice o' her kisses generally, but she put her arms up round his neck, then an' begged him to forgive her.

Eugene, he said there want no question o' forgiveness 'tween them two, he want 'fraid but she loved an' trusted him as he did her, an' two years want but a little time when they stopped to think o' the happiness that was waitin' for 'em at the end.

They kissed again, an' held each other close, an' then he was gone, and grandmother was left 'lone with her snowball bush, an' the long, long months that had yet to pass, 'fore she could see him again.

Well child, lovers part every day, sometimes for months, an' some-

times for years, an' sometimes forever. It aint nothin' to make a fuss 'bout, it happens too frequent, but Eugene an' Rachel was friends as well as lovers, an' had ben all their lives. Partin' come harder to 'em on that account, an' it want then, as it is now, when you can write back an' forth, every day in the week. 'Twas a circumstance to get a letter then an' an undertakin' to write one.

Still Rachel heard from Eugene, as reg'lar as he could manage it, an' somehow the days crep' 'long. The winter passed an' summer come, the snowballs come out on her bush, an' she kissed 'em when there want nobody lookin', for the sake o' the happiness that would come to her with their blossoms next year.

The blossoms fell, an' the summer passed, an' winter come round again—an' spring.

Eugene's business had prospered, he'd got the partnership, an' he wrote to Grandfather Gaines, his part o' the contract was fulfilled, he could keep a wife, an' he was comin' home to get her.

Grandfather 'n Grandmother Gaines had nothin' to say, if Eugene was doin' well, they'd give their word, an' they want the folks to go back on what they'd said, though he want an' never could be, the kind o' man they'd rather their daughter 'd a took.

But Rachel was all ready, her weddin' dress was made, an' everythin' in order.

Great grandmother see to it, that she was fitted out well in every way. There was money to do with, an' only those two girls to provide for. Rachel's outfit was real handsome, they'd had Miss Perkins sewin' in the house all winter.

Well, as I said, the time had come round. The little green snowballs come out on the bush, an' grew bigger an' bigger, an' whiter, an' whiter, an' little grandmother watched 'em day after day, till they fell—for Eugene never come.

Course folks made a great talk 'bout it, an' Grandfather 'n Grandmother Gaines was proud, an' it made 'em feel dreadful bad. They wrote to Eugene, but they didn't get no answer. Then they wrote to the man he'd gone into business with, but he never answered either, an' the weeks went by.

Rachel never lost her faith in him, for a minute, she believed if he didn't come 'twas cause he was sick, or dead, but her father an' mother didn't look at it that way.

They hadn't wanted him to have Rachel, but 's long 's they give their consent, they want by no means pleased at havin' their daughter slighted an' made the talk o' the town.

'Twas 'bout this time Grandfather Noyes came 'long. He was full ten years older 'n Rachel, but he had property, an' he'd ben wantin' her for years, only her bein' engaged to Eugene, had kinder hendered him. I reckon he thought he'd got a chance at last.

He'd made a mistake far 's Rachel was concerned, but her father 'n mother was all ready for him. He suited 'em a good deal better 'n Eugene, anyway, so they favored him right along.

They didn't waste no words on Rachel either. They told her she'd

got to have him, without any ifs or ands. They'd let her pick out a husband for herself in the first place, though her choice want 'cord-in' to their judgment—'twant necessary for 'em to 'mind her how it had turned out. If she hadn't any pride for herself, they had plenty for her, an' they 'spected her to be 'bedient, an' not make 'em no more trouble.

Poor little grandmother begged and prayed. She didn't believe Eugene was false to her, but if he was, or if he was dead, 'twas all the same, she couldn't never think o' no other man.

Then her father 'n mother see 'twas time to show 'thority, for they was certain they was actin' for the best. So they 'pinted the weddin' day, an' told Rachel, Mr. Noyes would be ready, an' if she 'fused to take him, she want no daughter o' their'n from that time on.

Rachel, she hadn't never disobeyed her father 'n mother in her life. 'Twas counted to folks for righteousness, in those days, to be 'bedient to their parents. But there was a point farther'n Rachel could go. 'Peared as if 'twould kill her to stand out 'gainst her father 'n mother, but she did it, an' told 'em she couldn't marry nobody but Eugene, whatever they did to her.

An' then, if you'll believe me, those two, Grandfather 'n Grandmother Gaines, was so sure they was doin' right, an' actin' for the best, they riz up an' told her she could go, there want no home for her there no more.

Her sister tried to interfere, an' speak up for her, but 'twant no use. 'Twas in the winter, Rachel hadn't no relations she could go to, so she crossed the street to Deacon North's, an' they took her in.

Well, she stayed with 'em 'bout a week, then she give it up, an' went back to her father 'n mother. She was sure Eugene was dead an' she didn't care what come o' her, but she couldn't stand their bein' displeased with her no longer.

Grandfather 'n Grandmother Gaines felt they'd done a good thing, an' when the weddin' day they'd 'pinted, come round, Rachel was married. She told Grandfather Noyes all 'bout it, but he was willin' an' glad to take her, with all the risk, he reckoned he could make her love him in the end.

It snowed hard the night 'fore Rachel was married, an' when she went out the front door, next day with grandfather, there stood her snowball bush loaded down.

"Bridal flowers for my weddin'," sez she an' broke off a branch as she passed, an' the snow shook off over her dress to the ground. "Even such flowers as these must fall," sez she. "Bare twigs are left me for my bridal bokay," an' she carried 'em away in her hand.

O, well, Grandfather Noyes was a good husband to her always, as I told you, an' she did her duty by him.

Yes, they heard at last why Eugene hadn't come back. Grandmother got a letter from him one day, a letter she'd ought to had months afore.

'Twas the yellow fever had stopped him. Half the town was dyin' of it, an' he stayed there to do his duty. Course all communication was cut off, they didn't understand fumigation an' disinfection an' such things in those days as they do now.

The only way when anybody was taken with anything catchin' was to shut 'em off by themselves. Eugene knew what a risk he was takin', but 'twas his duty an' that settled it.

His family hadn't never thought there was much o' the old Puritan spirit in him, but I reckon there was more than they gave him credit for. He didn't know 'twas goin' to cost him his wife, to be sure, but if he had—I wouldn't a ben afraid to trust him.

In his letter he begged Rachel to forgive him for lettin' other folks come ahead o' her, but he knew he was doin' as she'd want him to if she was where he could ask her. He'd done his best to get word to her, but couldn't tell whether he'd succeeded or no.

Course the fever went on till frost come, an' by that time his business was all behind-hand. He'd got to stay an' get it up to where 'twas fore he could come to Grandfather Gaines for his daughter. He knew the time her father 'd set him was up, but he reckoned considerin' the circumstances, he'd give him till summer again, an' he wasn't 'fraid but she'd wait for him—she an' her snowball bush.

Little grandmother come o' Puritan stock, too, an' 'twas lucky she did, she needed the blood o' saints an' martyrs to help her then.

As I told you, the letter 'd ben sent months ago, 'twas summer time already when she got it, an' she sat by her parlor window, that afternoon an' read it over an' over again, while the bees hummed in the bed o' mignonette outside, an' grandfather looked over his paper.

She read it over till she had it by heart, an' her duty too, plain an' sure. Then she got up, an' give her letter to grandfather an' went away out the room.

Grandfather was a good man, an' I don't s'pose he was more selfish 'n other folks. It couldn't be 'spected he'd be sorry word hadn't come from Eugene afore. But I reckon he had sympathy for him, an' he wrote to him.

I don't know what he said, he offered the letter to grandmother to read 'fore he sent it, but she shook her head. She'd put the matter out o' her hands altogether.

I couldn't a done as grandmother did. Right or wrong, I should a answered that letter myself.

Grandfather never give it back to her, I found it 'mongst his papers after he was dead.

'Twas old-fashioned, course, but a truer, faithfuller letter no man never wrote to the woman he loved. I could guess what it cost poor grandmother to give it up, but I reckon she knew there couldn't be no half way work 'bout her answer to it, an' it wouldn't do.

Grandfather lost his money not long after that, an' they sold the house up in the village, an' went down to the ferry to live, an' keep the tavern. Grandmother took her snowball bush 'long with her, an' planted it by the great front door.

'Twas beautiful the summer she died, jest loaded with blossoms. Grandfather 'membered how she'd loved 'em, an' he broke off a bunch, an' laid 'em in her hands. They said she looked so happy an' young again. I like to think she took her snowballs to heaven with her, an' went to meet Eugene with her bridal flowers on her heart.

## SINGLE TAX FALLACIES.

BY W. H. STUART.

No. 5.

Would the single tax increase wages?

The confidence exhibited by the new convert to the Single Tax theory, whose economic knowledge is often limited to that contained in "Progress and Poverty" and the columns of the *Standard*, (a rather poor equipment, by the way, for a student of economics), is often in amusing contrast to his attitude when the weak points of that pseudo economic theory are exposed, and sorely pressed he will protest that his reform is not offered as a cure-all for all the economic evils of the day. You will, perhaps, be informed in facetious desperation that the single tax is not warranted to cure consumption or snake bites, avert cyclones or earthquakes, or abolish death and taxation. It will be urged modestly as, at least, a "fundamental reform" that must precede any more comprehensive or final scheme for economic salvation: and he regards the socialist as one who is ignorantly opposing a reform that will ultimately usher in the highest ideal of the socialistic state.

No one, however, who has read "Progress and Poverty" will accuse Henry George of displaying any lack of confidence in his theories. The single tax is proposed as the "sovereign remedy" that will abolish destitution and establish an era of universal justice. It is offered as a full and complete answer to the riddle proposed by the Sphinx to the Nineteenth Century; which not to have answered would have meant destruction. The theory briefly is this: under private monopoly of land, its rents tend to advance and absorb all wealth over and above a bare living to the laborer. And the remedy proposed is to make land common property by the confiscation of rent, and thus restore the equilibrium of opportunities by giving all access to natural resources, upon equal terms. The argument being, that with free access to natural resources, upon payment of economic rent to the community, all would have an equal chance—as far as natural abilities permitted—in the race for wealth and that involuntary poverty would be necessarily abolished.

It may be admitted at once that any scheme of economic reform that would continue our present system of private ownership of land, would be unworthy of serious attention. But I believe that I have already pointed out several serious and fatal objections to the methods by which George proposes to make land common property; and in this paper I shall endeavor to show that while the making of land common property is an indispensable *sine qua non* in any final solution of the economic problem, that, of itself, and in the manner proposed by George, it would—under existing conditions—not even be a partial solution of the social and economic evils that confront us.

Under the single tax it is not claimed that labor—any more than now—would control the modern tools of production; they would still

continue in the possession of the capitalists, and the income or interest for their use would be the "wages," or "just return to capital" (as George puts it) for its "aid in production." Indeed, by the abolition of rent, the interest on capital and the wages of labor are by some mysterious and occult reason to marvelously increase. (The real reason for this expected phenomenal increase is one of the secrets that are preserved by the initiates into the mysteries of the single tax—outsiders can not discover it.) I have in a former paper shown that this interest is the tribute that non-producers are enabled to levy on labor through the ownership of the instruments of production. But it is claimed, that by destroying the monopoly of natural resources, and giving labor access thereto on equal terms, that the laborer will not work for an employer for less than his labor applied to land would produce. That, for instance, mechanics and laborers, when dissatisfied with the wages offered by the class that control the instruments of production, can apply their labor direct to the land and produce wealth. The result of which, we are informed would be, that instead of labor begging a chance to work as at present, employers would be compelled to compete for workers, and labor would, through this competition obtain its full and just reward.

The basis of the Georgian philosophy is therefore, that the landlords, alone, are able to live on the fruits of the labor of others, and if all taxation were abolished, save the tax on land, justice would prevail on the earth and poverty would be forever abolished. George says:

The essence of slavery is that it takes from the laborer all that he produces save enough to support an animal existence, and to this minimum the wages of free labor, under existing conditions, unmistakably tend. Whatever be the increase of productive power, rent steadily tends to swallow up the gain, and more than the gain.

Here we have it laid down explicitly, that rent of land is the one great monster that drains all surplus wealth. To illustrate his theory he says:

Take some hard-headed business man, who has no theories, but knows how to make money, say to him: "Here is a little village, in ten years it will abound with all the machinery and improvements that so enormously increase the effective powers of labor. Will interest be higher then than now?" He will answer, "No." "Will the wages of common labor be any higher, will it be easier for a man who has nothing but his labor to make an independent living?" He will tell you, "No, the wages of common labor will not be any higher, on the contrary all the chances are that they will be lower. It will not be easier for the laborer to make an independent living, in all probability it will be harder." "What will be higher?" "Rents, the value of lands. Go get yourself a piece of ground and hold possession." And, if under such circumstances, you take his advice you need do nothing more. You may go up in a balloon, or down a hole in the ground; you may sit down and live like the Lazzaroni of Naples or like the Leperos of Mexico; and without doing a stroke of work, without adding an iota to the wealth of the community, in ten years you will be rich.

This plausible rigmarole, in which rent of land is maintained to be the only robber of labor is contradicted both by statistics and experience—without drawing on the great fund of "common sense" that renders it absurd. Take, for instance, England, a country that

produces more land rent than any similar area on the globe. The census report for 1881 shows that of the national product of wealth for that year, less than one-sixth was absorbed by land rent. Statistics of the same country for 1889 show, that of one hundred fortunes on which probate duty was paid in that year, amounting to twenty-six million sterling, only five millions—less than one-fifth of the whole—was paid by landlords, the remainder was left by bankers, mill owners, cotton brokers, etc. In our own country we know that immense fortunes are accumulated by capitalists and corporations in manufacturing industries in which the value of the land used or owned was insignificant. The Standard Oil Co. laid the foundations of its great wealth, not by the ownership of land, but by the use of its capital in constructing pipe lines and refineries, which, by the way, would go untaxed under a single tax régime. What has the ownership or rent of land to do with the fifty millions accumulated by 'philanthropist' Carnegie? or what had rent or ownership of land to do with the two millions scooped in by "Old Hutch" in his famous corner in wheat, which business operation received the hearty endorsement of the "greatest living economist." And how about the Armour Meat trust, the Cotton Seed Oil trust, and the Leather trust, lately formed with a capital of fifty millions, and a score of others that neither control land nor are assisted by our fiscal system? Or what has rent or ownership of land to do with the financial legislation of the last thirty years, whereby the producers have been robbed of untold millions; which probably exceed in amount the "unearned increment" of a century? It must be remembered that the 'unearned increment' has been widely distributed among all classes, while the robbery effected by our vicious financial system has inured to the benefit of a small class of money-mongers, whose stealings would go untaxed under the single tax, on the ground that capital is a 'good thing' the production of which should not be discouraged by being taxed or "fined."

Since "Progress and Poverty" was written the value of agricultural land and the rent derived therefrom has greatly decreased, not only in this country but in Great Britain and Germany. Since the appearance of that book the agricultural areas of New England have become almost depopulated. Yet the accumulation of wealth and the exploitation of labor continually increases quite regardless of the fact that farming land can be obtained within sight of the factories for almost nothing. George says:

Everything could go on as now and yet the common right to land be recognized by appropriating rent to the common benefit.

Certainly it could. There is no doubt of it. The New Englander would never notice the difference. He can get all the land he wants now for a nominal rent, what better could he do under the single tax? Would not Carnegie, Frick, *et al.* continue to do business at the old stands, and upon the same terms? Would not the money-monger, the profit-monger and the horde of middle-men and useless parasites still continue to infest society and prey on honest toil?

This brings me to a discussion of the adequacy of the proposed remedy, to which I invite the reader's careful attention. George says:

What I therefore propose as the simple and sovereign remedy which will raise wages, increase the earnings of capital, extirpate pauperism, abolish poverty, give remunerative employment to whoever wishes it, afford free scope to human progress, lessen crime, elevate morals, taste and intelligence, purify government and carry civilization to yet nobler heights is—to appropriate rent by taxation.

This mixture of rhetoric and rhapsody is justified on the ground that with free access to natural resources, labor will be able to successfully contend against organized capital. But here at the outset the single tax is confronted by an absolute condition that can not yield to a recondite theory. It is this: In the New England states are thousands of abandoned farms, which, when "Progress and Poverty" was written, were the homes of a prosperous and contented class of producers. What is the cause of this sudden change? One word tells the tale—machinery. The enterprising single taxer can get access to these farms for a less rental than the single tax would be, for in many cases he can obtain the use of improvements as well as the use of the land upon the agreement to pay the taxes. Why don't single taxers rush in and occupy these lands instead of wasting pathos and tears over the injustice of being denied "access to natural opportunities?" Well, the answer is simple. The economic changes that drove the hand-loom weaver to the wall is driving out the small farmer. The uneven surface of the New England states is not adapted to the use of labor saving machinery. Wheat can be produced on the level surfaces of the Great West and Northwest by the aid of costly labor saving machinery for a third of the cost on the New England farms. In the April *Cosmopolitan* Mr. Howells takes his Altrurian friend a drive out in the country among the abandoned farms of New England. He says:

Now and then we came to a deserted homestead and I tried to make the Altrurian understand how farming in New England had yielded to the competition of the immense agricultural operations of the West. "You know," I said, "that agriculture is really an operation out there as much so as coal mining is in Pennsylvania, or finance in Wall street. You have no idea of the vastness of the scale."

To utilize in a profitable way the raw material of cotton you must employ the modern methods of manufacturing. In the same way to utilize natural resources—although not yet to the same extent—modern methods of production, requiring vast areas of land and costly machinery, must be adopted.

I shall quote from Hon. D. A. Wells "Recent Economic Changes" some facts bearing on this subject. He says:

The following statement has recently been made in California on what is considered good authority (*Overland Monthly*) as to the cost of raising wheat in that state, on ranches of different sizes. On ranches of 1,000 acres the cost is reported at 92½ cents per hundred pounds; on 2,000 acres, 85 cents; on 6,000 acres, 75 cents; on 15,000 acres, 60 cents; on 30,000 acres, 50 cents and on 50,000 acres, 40 cents.

And I may add that a recent law suit in this state served to verify the above figures, for it was shown that wheat was produced on a ranch of 50,000 acres at a cost of 50 cents per cental, while on an adjoining farm of 200 acres the cost was \$1.20 per cental, or nearly three times the cost of production on the large farm.

Mr. Wells says further :

On the great wheat fields of Dakota, where the use of machinery has reduced the requirement of manual labor to the minimum, it is estimated that the labor of one man for a year is equivalent to the production of 5,500 bushels of wheat.

As showing the immense saving effected by the use of modern machinery in the production of wheat.

On the wheat farms of the North Western United States it was claimed in 1887 that, with wages at twenty-five dollars per month and board for permanent employes, wheat could be raised for 40 cents per bushel, while in Rhineish Prussia, with wages at six dollars per month, the cost of producing was 80 cents per bushel.

Senator Casey of South Dakota, himself a "bonanza" farmer, stated in an interview with a reporter of the St. Louis *Globe-Democrat*, that he could raise wheat at a total cost of \$6.00 per acre, while the cost in Ohio and Michigan—based both on agricultural records and the report of a special legislative committee—was from \$18.00 to \$20.00 per acre.

One of the noticeable results of this great reduction in the cost of production is that agricultural land—except in a few favored localities—has greatly decreased in value.

I again quote from Mr. Wells :

The decline in the rents of farm lands in England in recent years has been estimated by the London *Economist* as not less than thirty per cent, or \$2.50 per acre on the wheat area—about \$8,700,000 yearly. And the decline in the value of British farming capital from 1880 to 1888 from the depreciation of land values, rentals, farms for stock and cereals, is over one thousand million dollars. Land in Germany, remote from the large cities, can be purchased for fifty per cent of the prices that prevailed at the close of the Franco-German war in 1870-71.

As to the cause of this depreciation in values our author says :

This depression in farms and farming products has been brought about by the utilization of immense areas of cheap and fertile land in the United States, the application of labor saving machinery and the cheapening of the cost of transportation.

He continues :

It is acknowledged that the great depression that has taken place in wheat for several years past is the result of the lessened cost of production and is likely—with an occasional exception—to be permanent.

As to the capacity of this country in producing wheat, Mr. Wells says :

That as to the present wheat production of the United States, Mr. Atkinson has shown that the entire wheat crop of the country could be grown on wheat lands of the best quality, selected from a part of the area of the single state of Texas, which exceeds the area of the entire German empire.

Twenty years ago the general consensus of opinion among farmers was that wheat, on the average, could not be produced at a profit for

less than one dollar per bushel, but the cost of production has been reduced one-half. Wheat in Chicago has declined from \$1.10 (gold) in 1872 to 67 cents in 1887, and is now selling in Dakota for 43 cents per bushel. The latter price will repay the cost of production on the "bonanza" farm, but to the small farmer it means ruin, the eventual loss of his farm, and his degradation to the position of a serf and a day laborer on the large holdings.

In some of the counties of this state devoted chiefly to wheat raising, the population, according to census reports, has decreased, the number of farms also decreased, but the size of the remaining farms increased, as has the total production.

It is safe to say that the profitable production of wheat by the small farmer has forever gone. It may of course be replied that all production is not confined to wheat. True, but the same tendencies are discernible in fruit culture, which a few years ago was supposed to be peculiarly adapted to the system of *le petit culture* of a few acres, but already we hear of orange and lemon groves of four and five hundred acres, and the same of olives, figs, and also deciduous fruits. Under the heading "Fruit Culture in California," a recent writer in the *Fortnightly Review* warns Englishmen of moderate means seeking investments here, of the tendencies to concentration in that industry.

When "Progress and Poverty" was written, the bonanza farm was in an experimental stage. It was permissible to predict its failure and declare, as the *Standard* constantly did, that only the small farm could be worked with profit, but with the facts given in this paper such claims are now absurd; for experience has proven that the same economies are possible in agriculture as in manufacturing when accomplished on a mammoth scale, and with the result of recent economic changes before us, it is safe to predict that within twenty years the working of small farms for profit will be an obsolete industry, and with the hand-loom will be spoken of as a relic of the past era of production.

In this state the impossibility of the small farm competing successfully with the bonanza tract is so apparent and admitted that influential newspapers have advocated a system of differential taxation in order to discourage the large holdings.

These are facts for single taxers to ponder over. To sum up; what is it that the single tax theory offers to those without capital, the class that compose 95 per cent. of our population and that produce *all* the wealth? Merely this; all that can be produced on land at the "margin of cultivation," i. e., on land of no rental value, and with the poorest tools in use. The difference between what could be produced on land of no rental value, and on land of the highest value would be confiscated by the single tax. The difference between what could be produced by the poorest tools and that of the highest productive capacity would be confiscated in the shape of interest by the small class of non-producers, who by the possession of capital and machinery will be enabled, as now, to appropriate all over a bare living to the real producers. For any lowering of the cost of subsistence that

might be effected by a decrease in the rent of land, any improvement in our fiscal policy, or by changes in our financial system; under the operation of the well known 'Iron law' of wages, remuneration for labor must continue to depreciate to the minimum amount for which the laborer will continue the production of wealth.

No, gentlemen of the single tax, a scheme of economic reform that will leave the modern machinery of production and exchange in the hands of a minority of non-producers, while those who produce all wealth are left only a bare subsistence, will not do. What labor wants is "The earth and the fullness thereof," and to effect this purpose it must itself own all the means of production. The economic system of the future will have use for both labor and capital, but it will have no use at all for the capitalist any more than it will for the landowner. This subject, however, I reserve for a future paper.

In the May MAGAZINE, Mr. Middleton admits that my article showing the insecurity of tenure that would obtain under a single tax régime, is vital to single taxers. But he says he answered the argument. Yes, certainly, but he has not disproved it. Try it again.

In reply to my argument showing the difference between economic and monopoly rent, Mr. Middleton confuses the issue by wandering off into a useless discussion as to the meaning economists attach to the words—economic rent. The only important issue is to determine how rent in amount would be effected by throwing all unused land upon the market—a necessary result of the adoption of the single tax.

I hold that rent under our present system of private monopoly is enormously increased; that the single tax, by destroying this monopoly, would reduce rent to perhaps one-fourth or one-tenth that now obtained. George ignorantly overlooked this important result that would inevitably result from the adoption of his theory.

To the average economist the question is of minor importance. But to George the question is a vital one, for his whole theory is based on the assumed sufficiency of a "single" tax on land. When he advocated confiscation of rent, he had in mind present rent, which he supposed would be transferred without diminution—less a small percentage from private pockets into the public treasury. Hence my characterization of the theory as shallow and absurd.

Mr. Middleton does not attempt to deny my exposition of the economic absurdity, but contents himself with the assertion that "it is merely a matter of conjecture, or theory as regards either its sufficiency or insufficiency." And yet if Mr. Middleton was asked what would be the probable effect on values if the various buildings in New York city were doubled or quadrupled in number, he would have no hesitation in telling you, that with such an over-supply of buildings, it would be impossible to dispose of them for one-tenth their cost, and the rental values would depreciate in like proportion. Now the same result in decrease of values would undoubtedly ensue upon the adoption of the single tax, for it would throw upon the market, not double or quadruple, but fifty times more land than there is present need for.

Under such conditions, what the decrease in rent would be is only conjectural as to whether it would approximate nearer to one-fourth or to one-fortieth of present rent.

Whether I am the first to point out this absurdity of the single tax theory is of little importance. But why should Mr. Middleton seek to discredit my efforts by citing Prof. Harris as a prior discoverer of the insufficiency of the single tax? Did Prof. Harris anticipate my argument as to the difference between economic and monopoly rent? If not why drag him in? And was it against the absurdity of my argument that "Asgill" (whoever he was) protested? If not why drag him in?

Mr. Middleton fears I overlooked the fact that under the single tax, vacant lands can not be occupied without payment of the assessed value of the state. I am glad to assure him that I quite agree with him, and also in the further fact that the adoption of the single tax will not destroy rent. I am pleased to make this admission for Brother Middleton appears to be truly grateful for any sort of admission that will tend to show any advantage of the single tax over present conditions.

However he suggests a way out of the difficulty that I have myself elsewhere suggested as an alternative plan, viz: For the government to hold the present rental values of land (after this confiscation) to about the present rates. This would substitute government for private monopoly. But then, what about that glorious privilege of free access to natural opportunities, that single taxers grow so eloquent over, if the government is to continue the monopoly system? and by the way, did it ever strike Mr. Middleton, that, whether the government charged economic or monopoly rent, it is all paid for out of the product of labor, labor pays it all.

The chief part of my argument consisted in exhibiting the absurdity into which Mr. Shearman fell, in extenuating rent under present monopoly of land and assuming its sufficiency under altogether different conditions. Mr. Middleton makes not the least effort to defend Shearman, and yet, he proceeds to cite the absurd estimate of Mr. Gros and others, as if no objection had been made to such shallow theorizing. Verily the mental processes of the single tax mind are a psychological enigma.

A word in conclusion with Mr. B. C. Stickney, whom I am pained to see at his old tricks of misrepresenting an opponent. Feeling his incompetency to argue the case on its merits, he takes the plan of crediting me with the statement "that when once a landowner has placed an improvement on his land, it is unjust for the public, at any time thereafter, to increase his taxes, no matter how greatly the land may increase in value, inasmuch as such increase of taxation would compel the land owner to sacrifice his improvements." He then wanders off into an attack on this argument, which it is not necessary to say I never made. I was only concerned in showing the insecurity of a tenure that could obtain under a single tax regime, not defending the land owner, who, like his congeners the capitalists, is

a robber of labor, a legal robber of course. Come, Brother Stickney, brace up, if you have anything to say in defense of the single tax I shall be glad to hear from you, the more so as I think you are orthodox on the subject. Brother Middleton (this confidentially) is, I fear, wobly and growing worse, and I am expecting in every issue of the MAGAZINE a protest from the orthodox wing of the party against his attitude of representing the party in this discussion. Brother Middleton has got into the unsingle-tax-like way of defending his opinions, instead of the good old fashioned way of calling all arguments "Bug-a-Boos," asserting that the *Standard* has answered such argument "a thousand times before" etc., etc. Hence he is, as might be expected, in trouble and needs real assistance.

---

## MR. STUART'S SINGLE TAX FALLACIES.

BY JAMES MIDDLETON.

No. 4.

I confess a feeling of disappointment in reading Mr. Stuart's fourth article on "Single Tax Fallacies," "Is Interest Just?" as he fails to make clear the relation of the single tax to the justness or unjustness of interest. Some able single taxers like Dr. McGlynn are as much opposed to interest as he.

I expected not only a keen analysis of interest, but also that he would show clearly its relations to taxation, how it would be affected by the single tax, and if unjust, how it was to be abolished and the effect of abolition.

Instead, after discussing at some length the theories of George, Bastiat and Böhm Bawerk, he launches into a severe arraignment of our whole social system, as though any attempts to better it, or to better the condition of humanity under it, were not worth considering, and that the only hope was to sweep it away. Like some others, he looks back to the feudal system and the time preceding the age of steam as a much better period for the laborer than the present; a sort of golden age. If our present system is not an advance, then the countless host of self-sacrificing men and women who have labored for humanity has labored in vain and there is no hope for the future. But history is against him.

Our present social condition is far from what it should be. Hunger and cold and disease are as painful to-day as in the past. But, though a smaller percentage may suffer, it does not follow that the wage system is not an advance on chattel slavery and serfdom. The time

may come when our present wage system will be replaced by a system vastly better, but it does not follow that we cannot, that we ought not attempt to better present social conditions, and that the approach to that better system is not through the improvement of the present. The present is the mother of the future, just as the past was the mother of the present.

Other things being equal, the better the mother, the better the child. The hope of the future is the present. It is the highest wisdom to make the most of present institutions; to so mould them as to get the best results for ourselves, trusting to the great laws of nature that our efforts shall have a glorious fruition for coming generations.

Let us trace, then, the relation of interest to our present social state, and its relations to present taxation and to the single tax.

In defining interest, Mr. Stuart has unfortunately tangled it up with the "surplus value" of our socialist friends, so that I am puzzled to know just what he means by the term.

He says, towards the last of his article:

All over that amount goes as interest which is the surplus value of the economists to the owners of land and capital. "Surplus value" includes rent of land, rent of money (interest) and profits. Interest on money is the premium the exploiter is willing to pay for the ability to exploit labor. Interest or "surplus value," therefore, is nothing else than a forced contribution from helpless or innocent people enforced by a favored class who are able not only to live without working but to control and even limit the labor of the majority.

This severe language applies to a great army of wage workers, as well, who have their little surplus in savings banks, building and loan associations, etc.

He uses "surplus value," rent, interest and profit as synonymous terms. As the socialists use the term "surplus value," it includes all that does not go as wages, whether it be rent, interest, premium for risk, or earnings of management, or fleecings. Rent and interest are forms of the "surplus value," but they are distinct forms.

If I borrow a hundred dollars, and at the end of the year pay back one hundred and six dollars, the six dollars are interest, and are paid for the use of the money for that time.

If I borrow one hundred bushels of seed wheat, and at the end of the year pay back one hundred and six bushels, the six bushels are interest, and are paid for the use of the wheat.

These are the two forms in which interest proper appears. Interest is money or capital paid for the use of money or capital.

Prof. Macvane, of Harvard, says: "On the side of the borrower, interest is a payment for the use of other men's savings. On the side of the lender it is chiefly a reward for abstinence." (*The Working Principles of Political Economy*, p. 270.)

If it were not for the complications arising from the use of money, I expect very few would attack the justness of interest in an individualistic state, or in our present condition of society. Of course, money of itself has no reproductive power, or power of increase, but things which money stands for, do. When I borrow money, it is not the money I want, but the things which I buy with it.

It is almost a waste of words to show that, through capital, we do and may make a vastly greater use of the forces of nature to increase, almost without practical limit, the material things humanity needs.

Mr. Stuart has compared the reproductive forces of nature with interest on money at 5 per cent. Of course, if interest went on unchecked against the labor of the debtor parent, and against the labor of his heirs to the latest generation, the result would be appalling.

But the same is still more emphatically true of the reproductive forces of nature. Take a grain of corn, a grain of wheat, a pair of shad, or a pair of chickens; if their reproductive forces could work unchecked for nineteen hundred years, I doubt if the universe could hold the last product even.

Fortunately, the debts of the parents are not a mortgage against the labor of their children; fortunately, the reproductive forces of nature may be regulated by man as well as by nature.

So long as we have our present commercial system, no one will deny my right to charge a price for a loaf of bread or for a bushel of wheat; yet, in that very right, and in the increase which comes from the use of capital, lies the right of interest. The price is regulated by natural laws and so is interest. The price may be regulated by statute, and by combinations, and so may interest.

Either the use of a thing is worth something, or it is not.

When I hire a horse, a house, a ship, no one dreams of denying the justness of the owner asking of me a payment for that use; yet the transaction is exactly the same if I borrow a plane or a bushel of wheat, and what I pay for use, in either case, is interest. The nature of the transaction remains the same, if I get the use by borrowing the money from one person and then buying the things from another. It is as if I borrowed the things, instead of the money.

If use of a thing is not worth something, why then borrow?

If by law you are compelled to *give* me the use of your horse, your house, your boat, your plane, or your wheat, or your money, whenever I want, you are made my slave.

Such a law would contain the very essence of slavery.

On the other hand, if you should take advantage of my necessities to place me under subjection, it would be unjust.

Prices and interest, to be absolutely just, should be the result of a free bargain between equals. The aim, then, of the state, should be so far as possible to put buyers and sellers, borrowers and lenders, on a plane of equality.

It is because I believe that our present system of taxation constantly tends to produce inequality, and that, on the other hand, I believe the single tax justly carried out would, more than any other single measure, produce that equality, that I am a single taxer.

Capital is the result of saving. In state socialism the saving would be done by the state, and the increase due to saving would go to the state, to be used as the state should direct.

As it is now, the saving is due to individuals, and interest acts as a stimulus to saving.

To abolish interest to the individual, without at the same time, or rather previously, instituting state socialism, would be to plunge us into the depths of barbarism and starvation.

Our savings banks, our building and loan associations, our fire insurance companies, and many life and accident companies, in all of which the workers of this country (robbers according to Mr. Stuart) are to a very large extent interested, would disappear.

Abolish interest and how would the worker make provision for his children for accident, sickness and old age? A large part of wages comes out of capital or savings. Diminish the formation of capital and the effect upon production and wages would be disastrous.

Interest, then, in itself, is a blessing and not a curse. The thing to do is to place buyer and seller, borrower and lender, on a plane of equality, and then whatever is unjust in present interest or in rent, or even in the "surplus value," will disappear as easily and naturally as the snows in spring time.

The ability to pay interest depends, in the long run, upon the increase to production given by the use of capital. The greater that increase the greater the ability to pay interest. Though the ability to pay increases with the increase in productiveness, other conditions remaining unchanged, yet the rate of commercial interest depends chiefly upon the law of supply and demand and the element of risk, a fact that George seemed to overlook in *Progress and Poverty*.

Whatever stimulates saving and the formation of capital increases the supply and tends to diminish the rate. Whatever contributes to the steadiness of production and certainty diminishes that part of interest that depends on risk, sometimes called the insurance feature. Whatever diminishes the need for capital also tends to lower the rate.

Our present system of taxation works disastrously in many ways upon those who have to borrow, as well as upon the wage workers. A large part of our local taxation, and all of our federal taxation, is placed upon the products of labor as products, and upon true capital in its various forms. Such taxes restrict production, diminish capital and foster monopolies. The removal of the tax on matches cheapened them; the increased demand stimulated the production of matches. So of quinine, and so of every article in use from which taxes have been removed.

The history of England and other nations tells the same story. When the restrictive corn laws of England were abolished, commerce and production leaped forward with tremendous strides, interest lowered, wages increased. To the extent products of labor are taxed you free the landlord, as such, from taxation, and you stimulate speculation in land. That again diminishes production and tends to raise interest. It not only restricts the formation of true capital in that way, but increases the demand for capital with which to purchase the right to work the great store house of nature. It is right here that our farmers, manufacturers and business men feel the pressure of interest most heavily, and where the real injustice of

interest arises, and the establishing inequality of conditions is fostered.

Take, for instance, "Extra Census Bulletin No. 22," on mortgages in Missouri. Four counties, Adair, Bollinger, Cass and Mercer, are analyzed. I find that 54 per cent. of the mortgages are on acres and lots and 52 per cent. of the amount was for purchase price.

Bulletin No. 28, on "State and railroad land sales on credit, says: "In twenty-six states fifty-six railroad companies made 186,469 contracts within the decade, and the debt incurred was \$88,143,769."

These statistics cover only credit sales, and not cash sales. It is safe to say that nearly 50 per cent. of the present indebtedness on real estate is due to a system of taxation that fosters land speculation. Rates of interest are increased by the unjust demand created, and instability engendered. Such are some of the effects of our present system of taxation upon interest and indebtedness.

Under the single tax, improvements being exempt, and a greater security for improvements being secured, production, as I have shown from historical facts as well as economic laws, would be greatly increased. Out of this increased production and greater security must come a stimulus to saving and investment. By the law of supply and demand, interest would fall, as well as by the elimination of risk. Historical facts justify these economic laws. Interest is lowest in such countries as England, where capital and security are greatest. The abolition of speculation in land and, lowering of rents and selling price will tend to equalize conditions the reverse of our present system, and thus bring borrower and lender nearer a plane of equality. A complete abolition of monopoly of land and franchises, and freedom from unjust taxation would bring an ideal condition of equality, of opportunity.

Space forbids to analyze fully the other parts of his "Surplus value," earnings of management or wages of superintendence, and fleecings, or, as George says, "spurious profits."

Earnings of management rest really upon the same law as wages. A captain of industry, an inventor who can double the product of a hundred workers, is doing them a benefit even if he gets half or three-fourths of that increased product. Interest and the earnings of management in a condition of freedom are absolutely just. In a condition of freedom fleecing would not be possible. It was to bring about *laissez faire*, freedom of production; *laissez passer*, freedom of trade, that the Physiocrats sought to introduce the *impôt unique*, or single tax, in France over a hundred years ago. When the single tax shall be justly carried out, their labors and teachings will have found fruitage in the increased happiness and prosperity of mankind. Then the greatest obstacle to the era of voluntary co-operation will be removed.

Mr. Stuart closes by a reference to my article on security of tenure, and wants to know my authority for the legal provision at tax sales to guard the improvements. If he needs any other than the reasoning of the article itself I would refer him to lawyer Thos. G. Shear-

man, one of George's ablest followers, who elaborated it in the columns of Henry George's paper, and to George's "Single Tax Library," also to *Progress and Poverty* for the general principle on which it is based. Lovell edition, page 264, says: "Let land owners retain their improvements and personal property in secure possession." Page 287: "What is necessary for use of land is not private ownership, but the security of improvements." Mr. Stuart evidently is not as familiar with single tax literature as so savage and confident a critic ought to be. Besides, he must remember Henry George has spoken neither the first nor the last words on the subject. It has had advocates from the time of John Locke to the present.

Finally, the principle of security is already recognized and in practical operation as regards franchises in some of our cities. In New York City the ferry franchises are sold at public auction, and subject to that very provision, and the new purchaser must compensate the outgoing holder for his improvements. The same is true in the city of New Orleans regarding street railway franchises. I presume it is recognized in all other cities where franchises are sold to the highest bidders for a limited time. What is there in the single tax to prevent an adaptation of the principle to mechanic Smith or farmer Jones?

Mr. Stuart's "insecurity theory" is utterly untenable.

---

## SHORT STUDIES IN POLITICAL ECONOMY.

---

BY WILFRED P. BORLAND.

No. 6.

The passages which appear in quotation marks are taken from Ridpath's *Cyclopedia of Universal History*.

The passage of the agrarian law, which was brought forward by Spurius Cassius had very little effect to relieve the distress of the common people; the administration of the laws being almost wholly in the hands of the Patrician order, of course, the laws which were calculated to limit their privileges and relieve the burdens of the masses were simply not administered.

In 485, B. C., the Fabians Gens usurped the consulship, and, contrary to the Valerian Law, held it for ten years. During this interval the Agrarian law remained almost a dead letter and the Plebeians suffered all manner of oppression at the hands of the Patricians. The Patricians, becoming jealous at the continued usurpation of the Fabii, finally expelled the whole Gens from the city. At the time of their expulsion they numbered three hundred and six citizens and more

than four thousand clients; they were enticed into ambush some two years after their expulsion and slaughtered to a man. After the expulsion of the Fabii, the contest over the execution of the Agrarian law was pressed by the Plebeians with renewed vigor.

"In 473, B. C., the tribune Genucius brought forward an accusation against the consuls, charging them with neglecting to make the promised distribution of lands. The day of trial was set, but on the night before the opening of the cause the tribune was murdered in his own house. His colleagues were terrified into silence, and the trial of the consuls came to naught."

"The murder of their favorite representative enraged the plebeians more than ever, and they demanded that henceforth the tribunal elections should be conducted exclusively by themselves without patrician or senatorial interference. The tribune Volero Publilius was the leader in this movement, while the patricians were headed by Appius Claudius. The latter entered the plebeian assembly, and for a while delayed the adoption of the measure proposed by Volero; but the popular leader rallied his adherents, secured his re-election as tribune, and succeeded in forcing the measure through the assembly."

"The law required that henceforth the tribunes of the people should be chosen by a *comitia* composed exclusively of plebeians. It was a great victory for popular rights."

After the passage of the Publilian law, the agrarian agitation of the plebeians ceased for a time; the laws were more justly administered and the people remained comparatively quiet. But the popular agitation soon broke out again over the question of the codification of the laws. The knowledge and practice of the law was restricted to the patrician order, and the senate and nobles purposely prevented the reduction of the laws to writing to the end that even the tribunes of the people should remain dependent upon others for an interpretation of the statutes. The masses now demanded that the statutes of the state should be reduced to a written body, to be known and understood by all. This demand was sharply resisted by the patricians, and the agitation of the masses became warmer than ever. As incidents of this contest, which finally culminated in the appointment of a commission of three lawyers who were sent into Greece to study their legislation with the object of collecting information for the formulation of a new code for the government of the state, the plebeians succeeded in having the number of the tribunes increased to ten, and the lands on the Aventine given up to plebeian occupation.

As the result of the information collected by the commission which had been sent into Greece, the state finally received the Twelve Tables of Laws, which became the basis of all subsequent legislation in both the republic and the empire.

"The code of the Twelve Tables was noted less for revolutionary enactments than for the succinct statement which it gave of the existing laws. The law of debt remained as before, except that the rate of interest was limited to ten per cent. The marriage statute still

interdicted the union of patricians and plebeians ; and the discrimination against the proletarii, or those whose property was assessed at less than eleven thousand asses, was retained as it had been since the days of Servius. So also the old laws relative to fines, imprisonment, and the punishment of death were allowed to stand with little modification. The great benefit conferred on the state by the new code was that it gave a fixed and indisputable form to that which had previously been the subject of endless disputes, and gave publicity to the whole so that every citizen might know the laws of his country."

The course of development was to give the plebeians a larger and larger share in the government of the state ; they were all the time demanding and obtaining the right to share in the privileges enjoyed by the patrician order. Every concession gained by the plebeians was hailed as a great victory for popular rights ; it never seemed to occur to any of the Roman citizens that in forcing the patricians to admit the plebeians to the enjoyment of the same privileges as were enjoyed by themselves, they were merely extending the area of privilege and building up a stronger interest for the retention of evils which the only proper course was to abolish altogether. All governments have, so far, followed the example of Rome, the great mass of the people have always been plundered by means of privilege, and the course of development of what we term popular liberty has always been, not to abolish privilege, but merely to extend its area, and introduce a few more persons to share in the plunder of the masses.

The year 367, B. C., was marked by the enactment of certain statutes more radical, and more leveling in their tendencies than any which had yet been proposed. These enactments are known as the *Licinio-Sextian Rogations*, after the tribunes Licinius and Sextius who secured their passage. Those statutes provided that no person should possess more than five hundred jugera—about three hundred and twenty acres—of the public land ; nor should any one pasture on the same more than a limited number of cattle. A clause of the same law assigned to every poor citizen a small farm of seven jugera. It was also enacted that all payments of interest on the current debts in Rome should be deducted from the principal, and that the remainder should be paid in three equal annual installments. The patricians exercised all their power to prevent the execution of these laws, and were so far successful that, in 342, B. C., the Roman army mutinied and marched on the city. The government was forced to re-enact the Licinian laws, to which were added four additional sections providing ; first, that both consuls might be elected from the plebeian order ; second, that no Roman soldier while in active service should be discharged without his own consent ; third, that no person should be elected to the same magistracy within ten years ; and fourth, that all interest on loans should be abolished. Although there was a constant struggle between the Roman commons and the privileged classes over the administration of the Licinian laws, the patricians could

not wholly nullify the laws, and their effects within the state were wholly good. It was the independent and patriotic spirit, fostered by the Licinian laws, that enabled Rome to assert her supremacy over the whole of Italy and placed her in a position to successfully contend for the supremacy of the world with her great rival, Carthage.

Those great contests with Carthage, known as the Punic wars, were fatal to the liberties of the Roman people. During the interval between the first and second Punic wars, the good effects of the Licinian laws were plainly apparent; the commons were contented and prosperous and the agrarian conditions were such as to afford little cause for complaint; it was during this interval that the tribune Caius Flaminius secured the passage of a law by which the northern lands, acquired by the state, were distributed to the poor. But as the lust for conquest became developed, the people became careless of their liberties; the checks which had been put upon the arrogance of the privileged classes were gradually allowed to lapse and the agrarian laws which had secured some approach to equality in the state were no longer observed. The process was such as has always accompanied great wars all through the course of human history; while the state is assailed by enemies from without, the people have no time to attend to the enemies from within.

The social condition of Rome after the final destruction of Carthage, and the subjugation of the empire created by Alexander the Great, was pitiable in the extreme.

"The state was corrupted by luxury and conquest, and the old heroic virtues of republican, agricultural Rome were well nigh extinct. Troubled no longer by formidable foes abroad, it only remained for her to rule what she had acquired, and to give opportunity for the growth of the arts of peace. For this duty the character of her people and the political constitution of her society rendered her unfit. The habit of conquest had become fixed by centuries of indulgence; the disposition to take by plundering rather than create by industry was now a second nature, whose demands would not be hushed."

"The fundamental difficulty in the state arose from the question of landed property. The multitude of small farms which had been the pride of the republic were now absorbed in a few vast estates owned by the nobles. The former land owners had become impoverished, and had gone to Rome. Their places were taken by slaves. The poor freemen became the clients of the rich. The old Licinian law, which required that the lands of Italy should be cultivated—at least in part—by free labor, had become a dead letter. All attempts to revive and enforce its provisions were resisted by the combined power of the aristocracy. When appeals for relief were made to the government the same power confronted the petition. It was evident that nothing less than a blow struck at the fundamental principle of land ownership could bring about the needed equilibrium in Roman society."

To this period of Roman history belongs the story of the great popular reformers, the brothers Tiberius and Caius Gracchus.

## THE SOLIDARITY OF ALL REFORMS.

BY JOSÉ GROS.

No. 1.

We can distribute minds in three general groups, viz: The retrogressive, the stationary and the advancing group. The stationary minds are about satisfied with the general course of what we call progress, because we have to give some name to the march of human events. The retrogressive minds are dissatisfied with present conditions because afraid of all tendencies to more or less rapidly modify the present social status. The advancing minds are afraid of nothing in the line of popular agitations. They know that, as it is in nature, so it is in human societies, that new and fresh creations must be preceded by agitations and turmoils, that dark massive clouds, with the roarings of the distant thunder, must shake yonder mountains, that lightning streaks playing with cloud and sky, with forest and mountain peak are but some of the inevitable manifestations of power asserting its own regenerative forces, its self automatic processes in the evolution of a new life and new forms with new beauties and new aromas, with harmonies fresh and new.

There is of course a great difference between nature in its mechanical exhibitions of power, when in search of a new equilibrium of forces, through an apparently transient disequilibrium, and human societies when agitated by conflicts of mind, in search of some form of justice, as a reaction against prolonged injustice, anxious of freedom in some form against oppression in forms more or less pronounced, more or less repulsive, more or less refined, but revolting enough anyhow. Social agitations or storms, if not properly conducted, are seldom conducive to much permanent good, and later on the work has to be done over and over, because improperly carried out from the first.

The distinctive feature of our historical period over all previous ones is the great variety of reform schools struggling for mastery over the petrified social structures that centuries have erected. Because, the more carefully we study past and present developments, in all social combinations, the less inclined we feel to see any fundamental advance, in that boasted progress of ours. In all periods do we approximately find the oppressed fighting against the same basic hidden evils, the men hardly conscious of what they need to do to really improve their general conditions, always and forever dealing with some of the symptoms of social disease, and never with the disease itself, always trying to suppress effects, never grasping the cause from which the effects spring up.

It is hardly worth while talking of human progress as a tangible reality as long as in all civilizations, crude or polished, primitive or finished, simple or complex we notice the same fact, viz: From 80 to 90 per cent. of the race forced to live on the conditions fixed by

2 or 3 per cent., and even the 12 or 15 per cent. between the two social extremes living more or less under the iron rod of king monopoly, in industrial and political conditions. As long as that fact remains, what is human progress but an ever changing group of outward modifications in national and individual life, which leave the essence and the foundations as incomplete as ever, as unjust as ever?

The great variety of reform schools we have spoken of can really be massed in two groups or schools, starting from two general conceptions of governmental action, the one extremely simple, the other extremely complex, the former in close alliance with natural and ethical laws, the latter in loose alliance with the same, when not at war with them, unintentionally of course. Perhaps it is natural that that should be so. After so many long centuries of complexities in all governments, how can we expect that all reformers shall at once give the cold shoulder to the complex, and long for extreme simplicity in governmental machinery?

It is a pretty difficult job for most minds to break at once through a long chain of traditions. In the matter under discussion the tradition is a certain degree of restrictions by the government, lest social anarchy follows because of too much freedom left to individual activities. Just as if too much freedom could ever produce any bad results, as long as by freedom we understand equal and universal justice. We therefore take for granted that in the evolution of social growth we must expect the two groups of reformers above mentioned, the one wishing reform through more or less restrictions, the other through freedom only, the latter giving to government just as few functions as possible, the former letting government have more attributes than compatible with maximum individual freedom.

We must try to have two short distinctive names for those two groups. One of them has it already, and the name is single taxers. The other general group, composed of several individualized groups, they all more or less opposed to the single tax, we shall call them plural taxers, in natural contrast with the non-advancing minds whom we shall call tutti taxers, because they want to tax everything, according to old notions on the subject, or at least as much so as the people are disposed to endure from their masters in legislative halls.

The general views of the plural taxers are socialistic, in the sense that they want to increase the duties and responsibilities of individuals to society by curtailing individual initiative. That implies the right of society to greater and greater interference with what single taxers consider individual rights to be respected by human laws, instead of being more or less trampled by them, under the assumption that public good requires it. All such socialistic schools are the inevitable result of past and present socialistic civilizations. And they all have been so because they all have interfered with individual rights, just as sacred as any rights can be.

There is, of course, a great difference between the socialism of our civilizations, past and present, and the one attempted or speculated upon by our socialistic schools, or plural taxers—as we have agreed

to call them, since some of them may not quite like the name socialistic. The intentions of such schools are good enough. Their aim is to suppress many of our glaring evils and make legislation rest on the common consensus of the working masses, while even our American civilization rests on giving to such masses just as few rights as possible, by concentrating all power, or pretty nearly so, on cliques of politicians.

We, therefore, have a great deal of respect for our socialistic schools, and consider their followers as brother reformers whose work will tell, sooner or later, in the grand rectification which is to take place if civilization is ever to be a reality and not a mere name, to simply gratify human infatuation or self-conceit. All the same, we must be frank with such reformers, and thus show them that many of their conceptions of social growth are far from correct, that their usefulness may increase. And that is what all reformers are after, to become, day after day, more efficient in the remodeling process of human societies.

We all have to go through the same gradual elimination of old conceptions and the acquisition of new ones, before we grasp the situation in full and master the fundamentals in all social phenomena.

The writer is often forced to laugh at himself when he reads his first Essays, twelve, fifteen and seventeen years ago. And yet, even then, he had already discovered the source of all social disturbances, the primary cause of all national and international disequilibriums, something that many of our brother reformers, the plural taxers, have not yet found out. The process by which he discovered the basic evil in question was as follows: He commenced, twenty-one years ago, to study the development of all national life in connection with economic conditions. He noticed that in proportion as population increased, the value of land increased, not only in cities but in country belts, purely agricultural lands. Then he observed that even land under a high degree of cultivation, gave a lower gross and a lower net product than land poorly cultivated, when the latter was low priced because of scanty population around, and the former was high priced because of larger population around, all in relation to the value of the land. For instance, land at \$5 per acre, poorly cultivated, gave \$10 gross and \$5 net product. Land at \$100 per acre gave \$50 gross and \$25 net product, even when highly cultivated. The crude farmer could then pay for his land in one year out of his net earnings. The skillful farmer needed to work four years to pay for his land out of his net earnings.

The above figures are round averages for the sake of illustration in vivid forms. The process can be noticed in all nations, under all social and political conditions. The process is, of course, more pronounced in modern times and in nations where the increase of population has been rapid. It is still more visible where industrial growth has been more intense, because of new inventions in saving labor machinery.

To a thinking mind, diverted from all personal infatuation, what

does that mean? Skilled labor less and less remunerative in proportion to new conditions, new needs and higher aspirations. It is all radically wrong, wrong from the bottom; essentially unjust from the foundation. Under such principles all civilizations must prove to be a naked farce, no matter how much wealth may be created, no matter how many brilliant inventions may be originated, no matter how much human wisdom and human virtue may be piled up here and there.

We therefore propose to show in future articles, that while all reform schools are more or less conducive to good, as a matter of educational process, and may eventually come to agree in a given line of march, 'yet, until this takes place all reforms are lame and incomplete, which fail to take the matter of healthy land distribution as essential to healthy social growth, or fail to give us a simple scheme by which to enforce and carry out such a healthy land distribution.

[To be continued.]

---

## CONSISTENCY WITH A VENGEANCE.

BY LEONARD J. MILNER.

---

Of what use to labor to raise the standard of a locomotive fireman? is the somewhat derisive inquiry heard by the writer a few days ago. in a car, where he was running over a long route, and it was uttered with a sneer. Let us have a reasoning together as the nearest possible way to a conclusion.

A fireman has just so many dollars on such a day each month, for a duty done in a certain way, and at stated times and on specified trains.

The railroad president, has so many thousand dollars a year for ? ? ? in some cases making use of his position to prostitute as many of its head men as is necessary to carry out the views of some few of the stockholders, regardless that the rights of all should be equally protected. He has also the usual way of taking care of all his and his wife's relatives, at the expense of the railroad corporation which is cheaper far than putting his hand in his own pocket and using his salary to do it, and in this it doesn't matter to him a button if they, the relatives, ever saw or heard of a railroad accounting or any other position into which these blockheads are thrust; the only point our president is interested in is the one of drawing the largest salary for the gang that he can arrange for, and the competents in the various offices

know that this procedure is not only a very common one, but woe to the employe that opens his mouth on the question, or refuses to help do the work for auditor or other official to make the bull heads work pass into the records; then it is not an uncommon thing for one of these men in charge of the management of a railroad to speculate with outside matters in some covert way, for instance, he would not hesitate with the connivance of some of the wealthy and controlling stockholders to build a few branch lines, at low cost, if not from rejected material of the trunk line, and then, when it was ready to run a slow train over, lease it to the main line, (his own line, to him as owner of one and paid manager to the other), at a rate it would never earn, "as a means of preventing competition." The honorable man would not hesitate to say that this was only a way of stealing, but that old fashioned term is now out of date, and he is looked on as a "pusher" or a "hustler," not as a "thief," oh no; and, then the great man at the head of the road dines in his private office (?) at the expense of the "road" on the fat of the city in which he is located, while his clerks and those who are so fortunate as to work all hours in his august dominion, dine on corn beef hash, four times a week, and on some other stale preparation that is to be had at the cheapest rate to be found then these men, who are so employed, are allowed just so many minutes in which to go to their "hash factory" or "foundry," as many term it, and if any one or six of them are bold enough to say aught in an uncomplimentary way of the stuff, they have to work until midnight for a day or two, "just for discipline." If the few men at the head of other people's property take a notion to do so, they lay out a route in which a bridge is to be built, and in such a way as to divert traffic for 100 or 125 miles, and three or four of them build the bridge, and then rob the stockholders of more toll that ought to go to the main line. This is not a fairy story, and the incidents sooner or later are to be unearthed in the courts of a western state, if not of the United States, and it will bring down more than one man who has figured his spoils at a round million dollars. The feeding of the men is, in the knowledge of the writer, not only true in each particular, but is done six days in a week in one of the largest of the cities that border on Lake Michigan.

Contrast our fireman, who gets out of bed perhaps at 2:30 a. m., eats what his wife lovingly prepared for him the night before, takes his dinner and breakfast in a "tin pail" and travels a mile or two and attends to getting his machine in readiness for his days' run, and is off at an hour when the magnate is just crawling, if not rolling, into his bed, after a night at the ? ? ? or with the "boys." The fireman eats his hastily prepared lunch, on the machine on the run, or at some station where he is allowed five or ten minutes, and during the time has a dozen other things to do, and uses a pint of water from the tank pail, or goes into the hash foundry of the station and pays "half rate" for his coffee.

What use to elevate these men, who honestly and faithfully earn their living, and try to do their work in a manner acceptable to the

dudes and fools put over them as in the various positions in and on a railroad. Who that has been there that does not know the whole story, and the Lord help him if he opens his mouth to say "nay," and if the half should ever be told, of what avail would it be to the fireman or to any other grade of the men who run our trains, and attend to business, while other and far higher salaried employes, of the same road, travel on their own business or are engaged in some of the schemes so frequently put before our courts to wrest the management from some scheme of speculation? Does the fireman or engineer have any chance to steal? If so, how? He does have a first rate opportunity to see and know things that he is expected to shut his eyes to, or woe to him or his if he dares to say his soul is his own.

It is then easy for the president to speak in terms of contempt of his men, when they have the audacity to assert their right to manhood. Let us suppose Mr. Depew, with his fifty thousand dollars a year to fret and worry away time with, never earned in his life fifty cents a day from his knowledge of railroads, but he is necessary to protect the interests of a family that inherited, not brains or business capacity, but the millions of their Dutch predecessors.

Take his satellite, Webb, with a double prefix, his whole railroad tutoring was five or six weeks in a tower in the yard in the N. Y. C. & H. R. R. R., and he is the son of the man who is annexed to the same family, but as he has some money in the "family," he "is a rising man," the willing tool of shrewder and fully as unprincipled men.

Jay Gould, who has so lately gone to his grave, was as guilty of many murders, as if he had shot or stabbed his victims, only it was from misplaced confidence he would get control of a property and then ruin its stock value, by methods peculiar to himself, and when all others were getting nothing from the road, he was quietly buying its stock at a price next to nothing, and as soon as he had control he would at once make a different showing, and then as soon as it was possible, would issue twice or three times as much stock as before, sell it and put the proceeds into his own pocket.

Andrew Carnegie has queer ways of stating the case. On his head and his tools, be the blood of the victims of his rapacity at Homestead. It is easy to create a row, and to violate his own agreement with his own men, "that he cares so much for" ten days before that agreement expired, and to claim anything under the hand of the miscreant who has caused the shedding of so much blood in his day, in the valleys of the old state on whose face he is and has been such a blot and excrescence, and who has been spared, let us hope, for some good purpose, not to wreak his venality on the men who are "only working men." Frick, Carnegie and the Devil have shown us what to expect when the Pharisaical author of "Triumphant Demagogery" is put into a place where his so called doctrines for the workingmen's uplifting shall be tried. Let us hope it will be when hell itself will yawn for this precious pair, and when the prostitution of the old state of Penn-

sylvania will not be possible at the order of such fiends in human form who menace people who can not live up to their agreements for the reason that the hirelings of a rich corporation can and do manage the governor of the state so that hundreds of thousands of dollars are spent in quelling a row started by Carnegie and Frick and their gang—for what? Let us see. If the men could be shut out a few days in advance of the time set, under pretence of a strike, Carnegie could reduce their wages—say twenty cents a ton on a part and forty cents a ton on more—say thirty cents on a ton on an average. Is it of any interest to this scoundrel to do this? Figure up the total production of the various mills in which he is owner or in control, and this small amount will be found to make a difference in his one year's profits of twenty thousand dollars a week, or not less than a million dollars a year, not quite enough to keep a few workmen and their families at work for a dull month or two, but this is not all.

Carnegie is one of eleven concerns, that are in a pool, for the rolling of all sorts of bar iron, and if he makes more than so many tons a month of that kind, he has to pay into the pool, fourteen dollars for each ton over such amount, and if he is so busy with other sorts of iron that he does not make so much as his quota, then the other ten have to pay him fourteen dollars a ton for what he does not make that month; it is so or was so only a few months ago, for the writer had in his possession the certified copies of the pool. This is not hearsay, it is fact, and it is a pity that the poor iron mill man can not run at a profit. Just let any man undertake to start a mill doing this sort of work and see how soon these "poor mill men" would play Standard Oil Company, and put the price of that iron, ten dollars a ton below cost, to kill the other fellow out. This is a fact, it has been done, is now being done, and the Cooper Hewitt & Company of Trenton is one of the eleven.

"For the loaves and fishes," is the evident game of these self-constituted philanthropists, and what is to be the outcome?

Edward Atkinson, of Boston, has had a ten-thousand-dollars-a-year place in an insurance company owned and run by the silk stocking cotton manufacturers, for the past fifteen years, not for his knowledge, but he was to be taken care of, and he can with complacency sit in his company's office, use its shorthand writers and dictate his twaddle to the workmen as to cooking in his Aladdin Oil Company's Cooker, with their oil and his gas, a meal of palatable and nutritive food for the sum of three cents. This is his scheme of getting men down into the slum of tramphood to grovel like the hog. And this demagogue has the effrontery to say this when he is the tool of corporations who pay their treasurers not a small but a large salary, to do what far abler men used to do for a tenth the pay, but with this difference, the old style managers were large owners and the concerns prosperous, the present ones are in many cases not owners, but they all go together and get the loaves and the fishes, marry their sons to wealthy daughters, and so propagate a race of the most arrant humbugs, who preach what they do not dare to practice, and what is only degradation to the working man.

What shall the working man do? *Stop playing fool.* Don't vote for the scum of creation or put it into their power to control the legislation in all the states. There is life and hope. Work in silence, do as the sneak thieves do by you, work your plans in utter silence for a year or two, do not allow the traitors to truth to know what is to be done, don't run three or four associations instead of one, don't keep any man at the head of any of your orders who has become rich in managing for you. Shut him out, let only the man who has done his duty fully, into your councils; do not be divided, remember the dying man and his sons and the bundle of sticks. If you stand together you can triumph and the sons and sons-in-law of the millionaires who never soil their white hands, but who drink, carouse, sail in half million dollar yachts and have a big time off the income of your work, would soon come to their senses and pay something like fair and equitable prices.

Think it over; no honest reasoner can dispute the statements or conclusions.

---

## THE CONCENTRATION OF WEALTH.

BY GEORGE C. WARD.

No. 1.

That "the rich are growing richer and the poor becoming poorer," is an assertion that is vigorously denied on the one hand and just as strenuously insisted upon, on the other. Optimists smilingly declare that the nation was never more prosperous, nor wealth more widely diffused among a prosperous and contented people than now; while pessimists sound grave notes of ominous warning and tell us that never were a people so rapidly becoming pauperized and enthralled in the yoke of industrial serfdom than are the people of the United States at this time. If one had no choice than to choose between these widely divergent and clashing opinions, nothing but perplexity and doubt could be the inevitable result. But luckily we have a more reliable source to look to for a definite conclusion of the matter. To private statistics compiled by reliable statisticians and to official statistics compiled by authorized officials must we go for a reliable answer to this much mooted question.

In proof that this assertion is not the mere vamping of a disgruntled "calamity howler," I submit the following statistics: The wealth of the United States January, 1891, expressed in round numbers, was \$62,000,000,000. The population of the country was 63,-

000,000; divided into families of five each and we have 12,600,000 families. Thomas G. Shearman, the eminent statistician, says that "40,000 families" had at that time secured one-half of the wealth of the country, \$31,000,000,000, an average of \$755,000 each. Again, he says that "fewer than 250,000 families had in their possession three-fourths of the wealth of the country—46,500,000,000, an average of \$186,000 each. As a result, if 250,000 families have secured \$46,500,000,000, there remains \$15,500,000,000 for 12,350,000 families, which would give an average of \$1,225 each. Tabulated the showing is as follows:

250,000 families at \$186,000 each . . . . .	\$46,500,000,000
12,580,000 families at \$1,225 . . . . .	15,500,000,000
12,600,000 families. . . . .	Total . . . . . \$62,000,000,000

So much for private statistics.

Again; the United States census reports show the proportion of the nation's wealth which is owned and in the possession of workers and non-workers—the idlers and the toilers. The showing is amazing! stupendous!! appalling!!!

Do we realize the alarming significance of the following table:

Year.	Workers' share per cent.	Non-producers' (parasites) per cent.
1860—16,000,000 . . . . .	43 $\frac{3}{4}$	56 $\frac{1}{4}$
1870—30,000,000 . . . . .	32 $\frac{3}{4}$	67 $\frac{1}{4}$
1880—40,000,000 . . . . .	24	76
1890—60,000,000 . . . . .	17	83

Do not misapprehend what is here meant by laborer. It not only includes the employes in manufactories, mines and shops, but also in the field. It not only includes the tenant and laborer on the farm, but every person who devotes his time to it—all except the non-producers.

That is to say that in 1860, labor owned seven out of sixteen dollars in wealth in the United States, and in 1890 only seventeen out of every sixty dollars in wealth. Again: In 1880 labor owned \$9,600,000,000 of the \$40,000,000,000 of wealth in the nation, while in 1890, after ten years of unexampled national prosperity and production of wealth, resulting in an addition of \$20,000,000,000 to the nation's wealth, labor got for its share only \$600,000,000, while the parasites got all the rest, or \$19,400,000,000.

Figuring in the arithmetical progression of the increase of the national wealth for the decade, we find that while the net increase of wealth, above consumption, for the year 1890 was about \$2,300,000,000. Labor got but \$80,000,000 of such increase, while what is broadly and vaguely termed capital absorbed the residue, or \$2,220,000,000. This being the case, labor is certainly vitally interested in the query "How were these results produced?" and it is in an endeavor to answer this question that this and two succeeding articles will be written.

All political economists are agreed in the main proposition that the three factors which conspire to rob labor of the product of its

toil and reap where they do not sow, are interest, rent and profit. It is when they endeavor to arrive at a determination as to which of the three factors is the greatest robber and attempt to approximately point out the amount stolen by each, that economists disagree. Some say that interest is the biggest rogue; others, that profit gets the lion's share; while yet others assert that rent is the robber of robbers and not only despoils the other robbers of their spoils, but also takes all that they leave. I shall endeavor to approximate the amount taken by each and give to each factor its due share of ignominy.

Commencing with interest, we will first dispose of the present existing private banking system.

From a recent issue of the American Banker, I clip this item:

"New Orleans is becoming a savings bank city, says, the Times-Democrat. The growth of manufactures here, the large amount paid weekly to hands, call for the establishment of institutions where these workers can deposit a portion of their earnings. The success of the savings banks already in operation prove this; and the two new ones can count, therefore, on business and prosperity. They will be a great boon also to the thousands in New Orleans who want some place in which to put their savings."

The foregoing paragraph faithfully portrays the state of affairs, not only in New Orleans, but in other large cities. Labor wishes to lay by a nest egg for future contingencies—the possible loss of a job and consequent idleness, sickness and old age, a prospective home, etc., etc. Attracted by the legend so familiar to our eyes—

4 per cent. interest paid upon savings deposits.

5 per cent interest paid upon time deposits.

labor deposits its savings and fondly dreams of the accruing benefits from money at interest. But; labor does not read, or, reading, does not weigh the import of this sentence: "The success of the savings banks already in operation prove this; and the two new ones can count, therefore, on business and prosperity!!" If labor would only think, it would soon find itself asking: "From whence comes the prosperity to these banks which makes their stock shares worth anywhere from 25 to 200 per cent. premium?" Turning to official statistics, labor would gaze in wonder at these figures:

#### NATIONAL BANKS SEPT. 30, 1892.

Capital, \$686,573,015. Surplus, \$238,871,425. Undivided profits, \$103,632,501. United States bonds, \$183,439,550. Cash, \$332,941,798.

#### NET PROFITS OF NATIONAL BANKS.

Table showing the net earnings of national banks from 1870 to 1892, both inclusive:

1870	\$55,810,891	1881	\$58,622,558
1871	54,558,478	1882	54,007,148
1872	58,075,430	1883	52,362,788
1873	65,048,478	1884	43,625,497
1874	59,590,931	1885	55,165,885
1875	57,936,224	1886	64,506,869
1876	43,638,152	1887	65,360,496
1877	34,966,990	1888	69,618,265
1878	30,606,589	1889	72,055,568
1879	31,551,860	1890	75,768,614
1880	45,186,084	1891	66,658,015
Total		\$1,262,926,864.00.	

Of this amount \$143,000,000 was added to the surplus fund, \$55,000,000 carried to undivided profits, and \$1,064,926,864 paid out as dividends to the holders of stock shares, being \$48,405,744 a year, besides the average sum of \$9,000,000 a year carried to surplus and undivided profits. (All approximations.)

Summary of the condition of 3,191 state banks, 168 loan and trust companies, 643 savings banks 416 stock banks, and 1,161 private banks—5,579 in all, 1891-92. Sept. 30, 1892.

## LIABILITIES.

Capital stock . . . . .	\$396,894,845
Surplus fund . . . . .	258,161,249
Other undivided profits . . . . .	70,558,927
State bank notes outstanding . . . . .	137,282
Debenture bonds . . . . .	11,865,280
Dividends unpaid . . . . .	906,798
Deposits subject to check, etc . . . . .	1,198,826,545
Savings deposits . . . . .	1,712,768,026
Due to other banks and bankers . . . . .	67,707,540
Other liabilities . . . . .	59,527,724
<b>Total liabilities . . . . .</b>	<b>\$3,751,649,164</b>

## RESOURCES.

Loans on real estate . . . . .	\$928,789,483
Loans on collateral security other than real estate . . . . .	868,749,969
Other loans and discounts . . . . .	984,374,347
Overdrafts . . . . .	7,267,436
U. S. bonds . . . . .	154,026,895
State, county and municipal bonds . . . . .	408,224,457
Railroad bonds and stocks . . . . .	158,697,319
Bank stocks . . . . .	46,302,910
Other stocks and bonds . . . . .	172,477,306
Due from other banks and bankers . . . . .	261,278,559
Real estate, furniture and fixtures . . . . .	97,070,359
Current expenses and taxes paid . . . . .	6,606,520
<b>Total cash on hand . . . . .</b>	<b>\$197,799,894</b>
<b>Other resources . . . . .</b>	<b>44,446,824</b>
<b>Total resources . . . . .</b>	<b>\$3,751,649,164</b>

When told that this prosperity was derived from the difference between the interest paid depositors and the interest paid by those who borrowed their deposits, labor would at once ask; "Who pays this interest?" And in tones of thunder the answer would come: "Labor pays all interest." Yes; instead of labor receiving interest upon deposits, labor pays the banks for taking care of its money.

On September 30, 1892, the amount of money coined, stamped and issued and not in the United States treasury was as follows:

Gold coin . . . . .	\$411,524,829
Standard silver dollars . . . . .	69,568,108
Subsidiary . . . . .	64,916,209
Gold certificates . . . . .	121,210,639
Silver certificates . . . . .	526,849,527
Silver treasury notes . . . . .	107,001,950
United States notes . . . . .	522,608,158
Currency certificates . . . . .	16,290,000
National bank notes . . . . .	166,066,106
<b>Total . . . . .</b>	<b>\$1,596,049,983</b>

But this volume or amount of money assumed or popularly supposed to be in circulation in the hands of the people includes all money of all kinds ever issued in the United States which was not in the United States treasury on September 30, 1892. Much of this money has been lost, destroyed, or carried abroad, and due allowances should be made for such losses. Four or five years ago Director of the Mint, Leech stated that \$270,000,000 of such gold had utterly disappeared and could not be accounted for. Since he made such statement we have lost a vast quantity of gold by export to foreign countries. I summarize thus:

Amount supposed to be in circulation . . . . .	\$1,596,049,983
Deduct—	
Loss in gold coin . . . . .	\$300,000,000
Loss in silver coin . . . . .	20,000,000
Loss in paper currency . . . . .	50,000,000
In banks of all kinds Sept. 30, 1892 . . . . .	530,731,182
	<hr/>
	900,731,182
In hands of people outside of banks . . . . .	\$695,318,801
Deduct for the people's pocket change, in store tills, business offices, etc., etc., . . . . .	150,000,000
	<hr/>
Actual working cash bankable capital . . . . .	\$545,318,801

Now then: On September 30, 1892, the banks of all kinds and loan and trust companies owed depositors the enormous sum of \$4,677,017,554, showing that every dollar of the nation's active, working capital was deposited more than eight times. At the same date, the same banking and trust institutions had owing to them, under the head of "loans and discounts," the sum of \$4,355,263,121, or almost exactly eight times the amount of active working capital in the hands of the people, which proves conclusively that every dollar of such active banking system was burdened with eight interest charges. Now assume that the average rate paid upon the total sum of these deposits was 3 per cent. (much too high an estimate), and we have an annual interest payment to the depositors of \$140,310,526. Now assume that the average rate of interest paid by borrowers was 8 per cent. (much too low an estimate) and we have an annual interest payment to the banks of \$348,421,049. Say it takes 1 per cent. upon all loans and discounts to pay the expenses of the banking system. The ledger then stands thus:

Loans and discounts, \$4,355,263,121 at 8 per cent. . . . .	\$348,421,049
Less 1 per cent. for expenses . . . . .	43,552,631
	<hr/>
	\$304,868,418
Less interest paid depositors . . . . .	140,310,526

Profits realized by banks in 1892 . . . . . \$164,558,892

Of course it will be readily apprehended that the interest received by depositors is paid right out again by them in increased cost of all goods, wares and commodities bought by them. Interest enters, as a factor, into the cost of everything.

I have thus elaborated the banking question, because the remedy seems so simple and easy. If the people would nationalize the banks, letting them be operated by the people, for the people, at cost, guaranteeing to depositors absolute security for and sure return of their deposits, and loaning such deposits to borrowers upon ample bankable security at the cost of carrying on the banking system; the result would be that the people, as a whole, would save annually the sum of \$304,868,418, and the depositors would really get, in decreased cost of goods, wares and commodities, the 3 per cent, they now imagine they receive but in reality do not get.

My readers will please bear in mind that national banks are not

allowed to loan on real estate, while the various other banks and loan and trust companies show only the sum of \$828,739,483 loaned upon real estate.

I shall take the statistics of the year 1890 as a basis of computation for the journey of exploration we are about to embark upon.

At the very outset, one is met with such a perplexity of vague, conflicting and variant estimates as to the amount of interest bearing indebtedness resting upon the people of the United States, that it is an exceedingly difficult matter to state with any degree of accuracy the amount of such obligations. The best that can be done, under the circumstances, is to endeavor to arrive at as close an approximation to the facts, as is possible. From a careful investigation and close consideration of the available statistics, I have arrived at the results represented by the following tabulation.

Loans and discounts of banks of all kinds, loan and trust companies, etc. . . . .	\$4,000,000,000
Railroad bonded indebtedness . . . . .	5,000,000,000
Farm and home mortgages . . . . .	4,000,000,000
Bonds of street car, water works, gas and electric light companies, brewery trust and other syndicate bonds, borrowed capital in manufacturing industries, etc., etc. . . . .	5,000,000,000
Building and loan associations, chattel mortgages, etc., etc. . . . .	1,000,000,000
National, state, county and municipal bonds . . . . .	2,000,000,000
<b>Total . . . . .</b>	<b>\$21,000,000,000</b>

It will be noticed that I did not follow the single tax formula of classing the railroad indebtedness as so much land values; nor did I treat the farm and home mortgage debt as one, the interest upon which would be included in the payment of the single tax of 5 per cent. upon economic land values amounting to less than one-half the face value of the mortgages. Aside from their right of way, the cost of construction of the railroads and then of rolling stock, etc., is probably more than four billions of dollars, which added to Mr. Gros' railroad land values of five and one-half billions, would give them double the amount of capitalization, the people are willing to concede they are worth. The single tax and the dividends upon their untaxed personal property, would constitute a robbery, which would not be lessened by the recovery of one-half of it as a tax. Nothing short of square repudiation can ever merge the farm and home mortgage indebtedness into an economic land value of less than one-half the amount of such indebtedness, or construe the interest as having been paid when the single tax upon such land values is paid to the people's government.

Now as to the interest charge upon this vast and incomprehensible burden of indebtedness. The railroads paid interest amounting to four and one-half per cent. upon five billions. Bank interest certainly averages eight per cent. Farm and home mortgages bear an average of seven per cent., to say nothing of cash commissions and commissions mortgages. I am of the opinion that we shall err in the direction of conservatism, if we put the average rate of inter-

est at six per cent., at which rate the interest charge for 1890 was \$1,260,000,000.

But not all, or nearly all of this vast sum of interest received was so invested in land, permanent improvements, industrial enterprises and real, tangible, material wealth as to form a part of the "residual increment" or net increase in national wealth. The greater part of it was received by individuals to whom it furnished the means of livelihood, or facility of living, without labor, upon the fruit of other's toil—"In the sweat of other men's faces."

It will be understood that this item of "interest charge" represents \$1,260,000,000 in wealth, which, although produced and created by productive labor, was absorbed and retained by the holders of the interest-bearing certificates of indebtedness enumerated above, at least one-fourth of which are held by foreign nations, principally by England.

Very much of the interest received by these foreign nations is re-invested in the United States, resulting in alien ownership, in great part, of our breweries, flouring mills, railroads, and various other industrial plants, as well as about seventy million acres of our lands.

I tabulate thus:

Net increase in wealth 1890 . . . . .	\$2,300,000,000
Interest charge so invested as to form a part of such net increase . . . . .	600,000,000
	<hr/>
	\$1,700,000,000
Less portion retained by labor . . . . .	80,000,000
	<hr/>
Residue to be accounted for . . . . .	\$1,620,000,000

In my next communication I will take up the consideration of the factor profit.

[To be continued.]

#### THE BRAKEMAN.

No doubt you have heard that bewhiskered old tale,  
Of "Comrades" since both 'em were boys,  
When one had his freedom, the other broke jail,  
They whacked up their sorrows and joys.

I know of a friendship more lasting and true,  
'Mong Comrades who live on the rail,  
A friendship that's loyal and lasting as new,  
When they pass down the shadowy vale.

CHORUS:—Always together in sunshine and rain,  
Facing the weather on top o' the train,  
Watching the meadows move under the stars,  
Always together on top o' the cars.

*Cy. Warman.*

## A DEFECT IN THE CAR COUPLER BILL.

---

BY WILFRED P. BORLAND.

---

The "Railroad Car Journal" calls attention to a defect in the recently enacted car coupler law which, it cannot be denied, is a serious one; that is the lack of any provision in the law calculated to secure uniformity in the means employed to secure automatic coupling of cars. As the law now stands the railroads may equip their cars with any one of the thousands of automatic couplers which are floating around the country, providing they do it within a specified time, and the consequence will be that we shall have nearly, if not quite as great a diversity in the styles of draw-bars under the action of the law as we have now. There is no possible excuse for the existence of the car coupler law other than the obvious one that the great army of men engaged in the work of car coupling will thereby be protected, absolutely, from the avoidable dangers of their calling, and this lack of provision for uniformity defeats the very object of the bill and leaves the employes, who are the ones most vitally interested, in very little better position with respect to an absolutely safe car coupler than they are at present.

There are thousands of automatic couplers in the country, any one of which, if adopted universally, would afford employes absolute exemption from danger; but it is a well known fact that when two or more separate styles of such couplers are liable to be encountered at any time the advantages of their automatic features are lost, and the employes who have to handle them are not protected, but on the contrary their danger is increased by the existence of those very automatic features calculated for their protection.

This bill is but another example of the petty, two by six, legislation with which we are continually afflicted by our servants (?) the law makers; a bill aiming at uniformity was introduced into and passed the house, but the senate promptly emasculated the bill by cutting out the clause which provided for the selection, by a vote of the railroads, of a universal type of coupler, and we have now a law, the ostensible object of which is to protect the employes; but which, like the great majority of the laws which are passed in the interests of the masses, does not protect them.

It is idle to say, as some persons do, that the law in its present shape is the best that could have been secured and we should, therefore, accept it cheerfully, on the principle that "a half a loaf is better than no bread." The present law is not the best that could have been

secured. The demand was for a law that would guarantee to the employees absolute safety from the avoidable dangers of car coupling; the conditions necessary to secure such safety were well understood, and our law makers should have been given to understand that they would better leave the car coupler question entirely alone until such time as they could pass a law which would fulfill those conditions. Nothing worth having may be secured without effort. Workingmen are slow to learn this lesson, but sooner or later it must be learned; and when it is learned, workingmen shall use their power intelligently to secure just laws which shall truly protect their interests, instead of leaving the onus of securing such laws to be assumed by pseudo-philanthropists, who are more interested in exploiting some pet theory of their own than in securing the real interests of workingmen.

Some time ago the *American Machinist* addressed a note to the different manufacturers of injectors throughout the country, asking for a record of the actual performance of the different injectors, for the purpose of securing data to determine the best performance of the injector in raising or lifting water to any height. The data thus secured was not very extensive, the fact being brought out that manufacturers, generally, pay more attention to the perfection of injectors having a great range of capacity than to any other point. However, the Hancock Inspirator Company furnished some data which is interesting as showing that, within the possible limits of working, the height of lift has not nearly so great an influence upon the duty of the instrument as might naturally be supposed;

Lift in feet.	Boiler pressure absolute above 0.	Temperature of Suction Fah.	Temperature of delivery Fah.	Lbs. of water fed per hour.	Lbs. water delivered per hour.	Steam used per hour.	Water fed per lb.; steam calculated by heat.	Water fed per lb. of steam.
22	75.81	34.88	133.95	1627.85	1775.58	147.73	10.815	11.019
22	54.06	35.42	117.14	1454.54	1560.97	106.43	13.240	13.666
22	95.47	47.80	173.70	1402.41	1573.77	171.36	8.186	8.184
11	75.38	53.20	131.09	1785.71	1920.00	134.29	13.786	13.298

With practically the same boiler pressure, we observe that the instrument delivered but little more than two pounds of water per pound of steam more at the eleven foot lift than at the twenty-two foot lift; it is true that there is over eighteen degrees difference in the temperature of the suction, shown in favor of the twenty-two foot lift, which would probably influence the result to some extent. Another interesting result which we observe is that, with twenty-one pounds less boiler pressure, slightly more water per pound of steam was delivered from the twenty-two foot lift than from the 11 foot lift, and that the increase of nearly twenty pounds in the boiler pressure,

at the twenty-two foot lift, had the effect to largely decrease the amount of water delivered per pound of steam, as compared with both the eleven and the twenty-two foot lift; all of which goes to show that variations in the boiler pressure have a much greater effect on the duty of an injector than variations in the height from which water is lifted, and that, in the words of one of the manufacturers, who responded to the inquiry, "With low pressures the capacity is comparatively greater than with high ones." In this connection a portion of the Nathan Manufacturing Company's response may be of interest:

The steam consumption, also, of an injector as a boiler feeder is of very slight importance, because the main advantage of injectors over feed pumps is not the mechanical power developed, but the caloric effect, which is the principal consideration of an injector intended to keep the boiler supplied with water at a high degree of temperature, which is of the utmost beneficial effect on boiler space and tubes. The amount of steam used by an injector is, therefore, of very slight importance, because this apparatus practically loses no heat, but returns the steam needed for its working to the boiler in the shape of hot feed water, which, in its turn, makes just so much less demand upon the fire to bring it up to the point of steam generation. For this reason evaporating tests have never been called for, and would only have the remotest scientific and theoretical value.

The Chicago and St. Louis Electric Railroad Company is out with a glittering prospectus to catch unwary investors. They have already got their yearly net earnings figured out at \$2,025,000. Fifty thousand additional shares of capital stock, bearing a par value of ten dollars, are offered at six dollars per share. The emphatic announcement is made that "The Chicago & St. Louis Electric Railroad will be built and trains will run over it at the rate of one hundred miles an hour."

---

## PRACTICAL TALKS TO YOUNG ENGINEERS.

---

BY L. B. MOORE.

No. 5.

In designing locomotive boilers the capacity for generating sufficient steam is considered first, the size of the cylinder being the basis. We must assume from this, that all engines should be free steamers, and so they should if the draft is right and the engine is handled properly. These are two points that are considered of paramount importance; the manner in which the engine is worked being the greater, as it involves judgment and skill in not using more steam than is necessary to perform the work. Here is where the engineer shows his ability to practice an intelligent economy.

It does not rest altogether with the firemen to furnish you the steam, it is the way you use it; he acts as a factor to the supply, you regu-

late the demand according to the work. If the engine does not steam freely look for the cause; you will probably find it in the front end, the nozzle may be too large; but it is more likely that the trouble lies in the arrangement of the diaphragm plate or petticoat pipe, as they govern the equality of draft through the flues in proportion as they are raised or lowered, which, in turn, regulates the equality of combustion in all parts of the fire box. I notice that on some roads the adjustable plate or pipe is being discarded for a permanent arrangement to prevent engineers from experimenting with the draft. This is wrong. It shows a lack of confidence in the ability and intelligence of the engineer, besides adding to the expense account. The master mechanic may be theoretical to an extreme, still the engineer can give him pointers in actual practice. But, as these conditions do exist we must make the most of them. In my last paper I spoke of free steaming engines, let us at this time consider the abuse of free steamers, or rather the extravagance that is practiced in their management. Virtually, you have everything your own way for the supply is abundant. With a poor steamer you are compelled to economize, but with a free steamer, economy is, if practiced, entirely voluntary with you; there is also a tendency to carelessness on the part of the fireman in burning more fuel than is required. Should the steam gauge show a reduction it is of no great moment, for it can easily be regained. The more common custom is to keep steam up to the limit, and to prevent waste at the pop valve by opening the firebox door to reduce the temperature of firebox. Let us look at the result of such a course. You have saved coal by preventing popping, meanwhile the destruction that is going on in the firebox is far in excess of the cost of the fuel saved. The heat in the firebox is at least 2,000 degrees when the air is admitted at a temperature of say 50 degrees. The drafts being heavy the admission of cold air is great, and it don't require a great stretch of imagination to perceive that such a radical change in the temperature must have a disastrous effect on the sheets and flues; but the mischief is done just the same.

Iron and steel are very sensitive to changes in temperature, contracting and expanding with very slight changes. The outer and inner shells being connected by stay bolts, and the heat and consequent expansion of the inner shell being the greater, a sudden contraction has a tendency to break stay bolts, something as you would break a piece of wire by bending it back and forth between the fingers. But the flues suffer most from these sudden changes in temperature; being thinner than the sheets their contraction is quicker, causing them to draw away from the flue sheet. This is the principal cause of leaky flues, more especially if they have been in use for some time and are thin from excessive rolling. When, in cleaning the fire, the blower is used more than is necessary, or when the fire is allowed to die out when standing some time on side tracks or laying up for the night, you can easily notice the effect on the flues. When it is necessary to put in a bank, put it in next to the flue sheet; close the dampers when not needed, and endeavor to maintain as nearly

uniform a temperature in the firebox as possible. While it is not possible for us to be perfect in our work, we should approach perfection as near as possible. In the course of a conversation with our traveling engineer, (who, by the way, has spent 35 years of his life in the service of railroads, and who devotes the greater part of his time to the devising of ways and means to reduce operating expenses), the other day I ventured to suggest that broken or leaky spouts were the cause of much of the waste of oil. He replied that "they certainly are, but who breaks those spouts? Can't it be avoided? Isn't it the result of carelessness? The repairs to these small things in a month are considerable?" A few years ago a friend of mine gave me a brass oil-can of the usual pattern; it has been in use nearly ever since and has only one dent to show for its service. Possibly if it had been a tin can, furnished by the company instead of a friend, the result would have been different, still the friendship applies to both cases. Much attention is being paid now to economy in the use of supplies. A few years ago it didn't make much difference to a railroad company whether you used a quart or a gallon of oil at an oiling; you are given so much now for a trip; the restriction is not only necessary but reasonable. It don't require much oil to run one hundred miles; if a quart is the limit it is enough. A good engine oil costs only about twenty-five cents per gallon; valve oil fifty cents. With a lubricator for the valves it is no uncommon thing to run three hundred miles with a quart of valve oil; this must be enough or the reverse lever would soon notify you of the deficiency.

We sometimes see an engineer get down to oil around, and just as he begins a friend steps up to him and starts a conversation; he becomes interested of course and looks at his friend more than at his oiling, with the consequence that he gets the can where it don't belong and bends the spout; he tries to bend it back with his fingers and breaks it off; the hole is now too large and he reduces it by flattening the spout, when behold! instead of an oil can he now has a sprinkler. Result, damage to can and waste of oil. It don't cost the engineer anything, but if he was charged with the repairs and waste he would consider it a terrible condition of affairs.

---

## CUT-OFF.

---

BY WILLIAM WEILER.

---

"Remember, many a little makes a meikle; and farther, beware of little expenses; a small leak will sink a great ship."—*Franklin*.

A few weeks ago a Westinghouse Air Brake Instruction Car was here, and the expert in charge seemed to lay great stress on the waste of air, as practiced by some engineers in making stops with the air-

brake. In order to draw him out more fully I ventured the remark: "air is cheap; it is free all around us." "Yes, he answered; but it takes time and money to catch it." And he readily proved this as a fact by calling attention to the length of time it took the air pump to again pump air into the empty trainpipe. If we are to be cautioned about avoiding a loss of air, then I am sure a caution as to the loss of steam, and its component parts—water and heat—will not be amiss. It ought to be the aim of every one to produce the best possible results at the least possible cost, and nothing will give a better result than the proper use of the throttle and the reverse lever to cut off at the right point. It ought not to be necessary to call attention to the functions of the cut off, but so many act as if its principles were unknown by them, or if known they are ignored, and a few words on its action may be of benefit to consider, and lead to a better understanding of the matter.

The cut-off is designed to govern the admission of steam from the boiler to the cylinders, and is made variable on locomotives so that the amount of steam admitted may be made in proportion to the work to be done. If we are to start a heavy train we put the lever in the corner, and, while the valve does still cut off the steam, it does it so late in the stroke that the steam from the boiler follows the piston nearly the whole length of the stroke, thus using nearly a whole cylinder full of live steam, but after starting the train the engineer "pulls her up," and the amount of "hooking up" determines the difference between use and waste. Take, for instance a "mogul" freight engine, with 18 inch cylinders and 24 inch stroke, and under favorable circumstances she will pull her train at say 15 miles per hour with a pressure of 130 pounds on her boiler, while cutting off at 8 inches; being one-third of her stroke. Now let us suppose that instead of being run on the 8 inch cut-off the engineer habitually ran her on 12 inches. An 18 cylinder has a piston area of nearly  $254\frac{1}{2}$  square inches, and 8 inches in length will require about 2036 cubic inches of steam to fill it, while 12 inches of its length will take 3054 cubic inches, a difference of about 1018 cubic inches for each filling. As each cylinder is filled twice for each revolution of the wheel it would make a difference of 4072 cubic inches, or nearly two bushels of steam, for every turn of the wheel. Steam at 130 pounds pressure has a volume 190 times as large as the water of which it is formed and it would thus take  $\frac{1}{3}$  of a quart of water to supply the extra steam used in filling the 4 inches of space between 8 and 12 inches of the cylinder. With a  $5\frac{1}{2}$  foot wheel it takes 305 revolutions to a mile, and with  $\frac{1}{3}$  of a quart extra to each revolution would make just about 100 quarts or 25 gallons of water to each mile, 250 gallons to 10 miles, 2500 gallons to 100 miles. Truly "many a little makes a meikle," when a small item like that  $\frac{1}{3}$  of a quart can amount to nearly a full tank of water in a day's run. Let us look at it from another point of practical experience, which every observant runner has no doubt noticed and proves a fact namely that up to a certain limit hooking up will increase the speed even when the throttle is left in the same

position. Have you noticed this? Now let us see whether there is a good reason for this. Let us suppose 130 pounds of pressure on the boiler, and 120 of it to reach the piston with a wide open throttle. We are using 8 inch cut-off, so for 8 inches of the stroke we have 120 pounds per square inch on the piston. Steam being then cut-off by the valve the action on the piston is continued by the expansion of the steam and as it expands into a larger space it loses its power in the same ratio as the space it fills is increased; therefore when the 8 inches of steam admitted with 120 pounds pressure has expanded so as to fill 16 inches (just twice as much space) its pressure has fallen to 60 pounds (just half of what it was at the start) and we obtain an average of 90 pounds for the second of our 8 inch spaces. Now this 60 pounds has to fill another 8 inch space and in filling it its pressure is reduced to 45 pounds giving us an average of 52 pounds during the last 8 inches of the stroke, 120 and 90 and 52 equals 262 and this divided by 3 gives us 87 pounds as the average pressure, and exhausted at 45 pounds giving a net result of an average of 42 pounds above the exhaust back pressure.

Take the same locomotive using 120 pounds as the initial pressure and cutting off at 12 inches, we thus have 120 pounds for the first 12 inches, and then in using the steam to expand and fill the other 12 inches we reduced it to 60 pounds at the exhaust or an average of 90 pounds during the last half of the stroke, thus averaging 105 during the stroke or 45 above the exhaust pressure. This is with a full throttle in both cases, but as this is made on the basis of a slower movement the later locomotive would make better time. If, however, we throttle down to 106 pounds and expand down to 50 thus averaging 101 on the first 12 inches and 75 on the second, we get an average of 88 for the whole stroke with an exhaust at 50 or only 38 average above exhaust, thus showing 4 pounds in favor of the short cut-off.

But as practice is better than theory, let me relate what happened in my own experience. I used to, in years when injectors were not so plentiful as they are now, sometimes run a "mogul," and found that if I had 130 pounds I could make good time on 8 inch cut-off and keep her full with the pump, but if I was obliged to drop her lower than that, the pump could not supply the water needed and I had to have help from the other side. The pump certainly had to make as many strokes in each case in going over the same distance and thrown as much water, but it was the using of the steam that made the difference.

Study and practice has thus led me to believe that by cutting off as short as possible to pull the train and make the time, and in order to do this try to keep the pointer up to the mark, even if obliged, at times to lose a little water, for if obliged to "drop her" you would be apt to lose more water and be harder on your fire and your fireman also.

If, however, a little humoring and coaxing will not do, it will be better to stop in time and fix the fire than to run too low in steam or water and have too long a "lay out" to prepare for a new start.

## LOCOMOTIVE SPEED TABLE.

BY ROBERT GRIMSHAW.

The following table shows the circumference of locomotive driving wheels of various diameters and the number of turns per minute required to run at 50, 60 and 70 miles per hour.

DIAMETER	CIRCUMFERENCE.	50 MI. PER HR. 4,400 FT. MIN.	60 MI. PER HR. 5,280 FT. MIN.	70 MI. PER HR. 6,160 FT. MIN.
4' 6" . . . .	14.1372 feet.	311 turns.	373 turns.	435 turns.
4' 9" . . . .	14.9226 feet.	294 turns.	353 turns.	412 turns.
5' . . . . .	15.708 feet.	280 turns.	336 turns.	385 turns.
5' 3" . . . .	16.4934 feet.	266 turns.	320 turns.	373 turns.
5' 6" . . . .	17.3788 feet.	253 turns.	303 turns.	354 turns.
5' 9" . . . .	18.1642 feet.	242 turns.	290 turns.	339 turns.
6' . . . . .	18.8496 feet.	233 turns.	280 turns.	326 turns.
6' 6" . . . .	20.5204 feet.	214 turns.	257 turns.	300 turns.
7' . . . . .	21.9912 feet.	200 turns.	240 turns.	280 turns.
8' . . . . .	25.1328 feet.	175 turns.	210 turns.	245 turns.
9' . . . . .	28.2744 feet.	155 turns.	186 turns.	217 turns.

## CLINKERS.

There are many enginemen who are becoming gray headed long before their time because of the consuming fear that their rights are continually being violated.

□ We all know these people, they are always on the hunt for some member of the grievance committee, they always have a case on hand that demands immediate action, some man has a run he isn't entitled to, they have been cut on their detention time, there is always some sort of conspiracy on foot to defraud them of their rights.

I wonder it never occurs to such persons that their exaggerated notions concerning their rights sometimes make them appear ridiculous; why, I have seen men whose anxiety was so great that they would not allow themselves time to wash up after completing a trip, before consulting the board to see if there had been any changes made in their absence which would furnish them a basis for a kick.

The established principle of recognizing the seniority rights of enginemen has been of great use in checking nepotism, and other sorts of favoritism in the service; but the tendency of its over zealous ad-

vocates to push it to extremes is having the effect to bring the whole system into disfavor.

Those persons who are so insistent about their rights should remember that officials sometimes become weary with being confronted by a grievance committee, demanding changes in every trivial and unimportant regulation they chance to institute.

They should be satisfied with the fact that the general principle is recognized, and they should remember that grievance committees have much greater influence when they are called upon to adjust only palpable and direct violations of the general principle, than when they are required to deal with cases depending wholly upon a technical construction of the schedule.

All the same, I don't know as we could get along without these persons. We have a certain class of enginemen of free and easy disposition, who are inclined to let their rights go by default; only let them go on in their happy go-lucky style and they don't worry much about either their own right or anybody else's.

It needs the kicker to rouse those people from their lethargy, and put spirit enough into them to make an effort for the common cause; so if the kickers will learn to be just a little more moderate they may feel that they are the means of accomplishing a great good.

---

## SCHOOLS OF INSTRUCTION.

MR. EDITOR:—The following communication to *Locomotive Engineering* contains the description of a plan which might be imitated, to the immeasurable benefit of both firemen and engineers, at every division headquarters in the country.

I have been a reader of your valuable paper since May 1888, and have watched it grow from a small 16-page paper to its present size, and predict for it a future not equaled by any mechanical paper published. The hints dropped by it have been of great value to myself and I presume many other readers.

The Enginemen's Mechanical Association of North Platte, Neb., was suggested to me by reading your paper, and as I have not heard of any other association exactly like it, perhaps you might like to give your readers an idea of what we are.

The Union Pacific, through Master Mechanic J. H. Manning and Division Foreman M. K. Barnum, furnished us a coach and fitted it up with tables and shelves. In it we have one of your valve models, also models of different injectors, lubricators, metallic packings, Westinghouse and New York brake and triple valves, pump governor, Leach sanding apparatus and other engine appliances. We subscribe for several mechanical papers, among them *Locomotive Engineering*. We meet as often as we can and exchange ideas, and I believe it has been of great benefit to most of its members.

NORTH PLATTE, NEB.

W. J. STUART.

There are very few master mechanics but would take kindly to

this idea, and do everything in their power to aid the men in a laudable desire for improvement. By a small assessment upon each member, each month, the club would be able to keep on file all of the leading mechanical publications of the country; and, by the aid of the railroad company, they could secure models of all the latest improvements in locomotive appliances, and familiarize themselves with their construction and operation. A sort of a debating club might be formed; topics could be given out, by the president of the club, and persons assigned to discuss them. In this way much valuable information might be obtained, that could be brought out in no other way. Experiences on the road could be discussed and compared, and different ways of meeting emergencies could be related and commented upon. Besides being an important factor in fitting firemen for the ordeal of examinations for promotion, such a club would exert a wonderfully favorable influence in keeping men away from saloons and billiard rooms; and there are many towns in this country where unmarried railroad men have no place to go, to pass the time while in off the road, unless they do go to some saloon or gambling hall.

The Brotherhood lodges, at the different division points should take this thing up and follow the example of "The Enginemen's Mechanical Association" of North Platte, Nebraska.

*Wilfred P. Borland.*

---

### THE QUESTION BOX.

---

**MR. EDITOR:**—I am in favor of having a question box, but I do not agree with Wilfred P. Borland as to the manner of conducting it. Instead of having the editor make copies of the questions as they come in, to be sent to a few persons for answers, let the questions be published in the MAGAZINE so that all may have a chance to answer them and get the benefit of them, rather than those few selected by the editor. Also, I do not like Mr. Borland's suggestion as to having the names of contributors withheld. There are a great many persons who take pride in answering a question correctly and they naturally like to see their names appear in connection with same. I believe that engineers and firemen do not ask questions because they fail to take interest enough in the questions asked by others, on the expectation that some one else will answer the questions, rather than through fear that their identity may be discovered. No person who takes an interest in the questions asked, or the work which he follows, will make fun of another for trying to get the information he desires through the columns of the MAGAZINE. I should not draw the line at certain questions, but should let the

contributors ask for what information they desire. Mr. Borland may be an old hand, but there are many who are only beginners at the business, who are anxious to get all the information they possibly can. The simple questions that are asked, may be answered by the sender, himself, after a little study, or he might get them answered by his engineer.

Well, I believe I have dwelt long enough on this subject, and will close with the hope that we may have many contributors to the question box in the near future.

PINE PLAINS, N. Y.

*Harry E. Pulver.*

---

### SOME QUESTIONS.

---

MR. EDITOR:—In the February MAGAZINE I observed, under the above caption, the following question: "If your engine should die out on the main line, and you had about twenty pounds of steam, injectors, tank valves, and hose, air tight, could you fill her boiler without getting her hot or bailing up? Certainly you could, but how?" I have searched in vain for the solution of this problem. I hoped to find the answer in the March MAGAZINE, but was disappointed; will some one kindly supply the answer to this question? In my search for information on the subject, I put the question to various firemen. The answer I generally received was, "Well, I saw that question in the MAGAZINE, and wanted to ask somebody the same thing." I also put the question to several engineers. I made inquiry of one engineer; he asked me to repeat the question, and I did so. A look of contemptuous scorn covered his face while he answered: "Young fellow, the proposition is absurd on the face of it; there ain't any injectors, tank valves, or hose, air tight on the Air Line road." I propounded the question to my engineer, while we were coming through the yards; as he was lost in thought I assisted him by adding: "Certainly you could, but how?" He meditatively picked a few broom straws and splinters from a piece of waste; then, dismissing the subject from his thoughts, he turned to me and said: "Get her a little hotter Reinhart, I want to work my injector pretty soon." The gauge showed 110 pounds. Forced at last to work out the problem for myself, I came to the conclusion that the only way was to attach one of Thos. P. Knapp's patent low pressure injectors, warranted to work with a minimum steam pressure. An injector, I believe, as yet unknown to the commercial world.

ATLANTA, GA.

*R. Wurreschke.*

A NEW YORK dispatch says that Mr. C. F. Doane, for many years the trunk line immigration agent at New York, has been taken to Bellevue hospital insane. Mr. Doane had an annual salary of \$8,000 until about eighteen months ago, when it was greatly reduced, and it is asserted that as a result his mind finally gave way. If every railroad man who loses a good position or has his salary reduced should go crazy the number of insane asylums would have to be greatly increased. Uncertainty is one of the characteristics of the service, and railway men should bear their disappointments philosophically and take their good fortune without counting too much on its continuance—unless they are lucky enough to have a long time contract.—*Railway Age*.

AN estimate has been made that 1,000,000 acres of forest are required for the annual supply of wooden sleepers for European railways. These forests are properly managed so as to yield a steady return, while nothing of the kind can be said of American forests. This explains why German foresters are interested in watching the progress of forest destruction in America, where it is now merely a question of ten or fifteen years before a timber famine must occur, which will greatly enhance the value of European forests.—*Nature*.

THE rapid development of electric railroading within the past few years has led to their extension in such a way as to make them competitors of the steam roads in some localities. And now the New Hampshire Commissioners present a protest against the granting of franchises to electric roads for the right to use the public highways, on the ground that the steam corporations, with whom the electric road enters into competition, is required to buy its right of way, construct and maintain its roadbed, bridges, and fences, and there is no good reason why the competitor, whose business is exactly the same, should be given a roadway and furnished with a roadbed, bridges and fences at the public expense.—*American Engineer*.

WE have during the past year illustrated and described several devices for forcing air hose into its fittings. All these devices provide a powerful clamp for holding the hose, and the power for forcing it into the fittings is supplied either by hand levers or by an air cylinder. These devices are so greatly in advance of the old laborious methods of placing the fittings by hand that a return to such methods would seem a step backward. At the Chesapeake & Ohio shops at Richmond, however, master mechanic Lloyd employs a very simple method and does rapid work without apparatus. He first immerses five or six inches of the hose in hot water and then slips it over the fitting. The operation is easy and simple and no oil is used. Apprentice boys handle the work. The heating of the hose in the hot water produces no injurious effects upon the rubber. The softening of the rubber, followed by the immediate application of the clamp, makes the joint absolutely air tight, without the use of varnish or cement.—*Railway Age*.

NOVELTIES in the way of car couplers are becoming rare, the ingenuity of many inventors having almost exhausted the possibilities in this direction. Under the circumstances we raise our hat to Frank Bender, Armourdale, Kansas, who has patented a car coupler which he might consciously swear is novel and original. It consists of a block which is slotted to take in two links set side by side on edge. Mr. Benner ought to exhibit his coupler at the World's Fair.—*Locomotive Engineering*.

THE Rhode Island Locomotive Works report having built or having in course of construction thirty-nine compound locomotives, thirty of which are of the two-cylinder type and nine of the Johnstone design.—*Locomotive Engineering*.

# WOMAN'S DEPARTMENT.

EDITED BY IDA A. HARPER, INDIANAPOLIS, IND.

## ENEMY OR FRIEND ?

In another place will be found an article by W. P. Borland, which requires a more extended reply than can be made in a footnote. We have read Mr. Borland's articles in the *MAGAZINE* with much pleasure and are glad to have him send a communication to the Woman's Department, even though we differ radically from the sentiment expressed. It would be impossible to take any position on any question which could not be sustained by individual examples. For instance, one might declare that man is an angel, and many incidents of his courage, generosity, kindness, self-sacrifice, etc. might be produced to prove this statement. On the other hand, if one should assert that man is a fiend, there would be no difficulty in sustaining this assertion through the police records of every day. In forming an opinion on all questions relating to social conditions we must be governed by the preponderance of testimony and not by isolated cases. If it can be shown that, *as a rule*, women are cruel to other women, then we will admit that our correspondent's position is correct. If, on the contrary, it can be shown that, *as a rule*, women are kind and helpful to other women, then, we think, he will have to admit that he reasoned hastily.

It must be remembered that the reporters on such a paper as the *New York World* are expected to be sensational at the expense of most other qualifications, and that paper, especially, has established a reputation for unreliability. If its correspondent, disguised as a country girl, had reported that she was insulted by men and assisted by women, her report would not have been worth publishing, for that is just what would have been expected. It was only by having it tell a different story that she could make it "novel and interesting." It may be accepted that, as a general thing, a girl who walks quietly along the streets attending to her own business will not be insulted, although there are many exceptions to this rule. At the same time it will be admitted that thousands of young girls annually are ruined by men who ought to be their protectors. In every city are found two institutions, "Home for Friendless Women," and "Foundling Asylum." These are maintained to care for the victims of man's crime against woman, and, almost without exception, they are in the entire charge of the women of the community. - On the boards of these institutions will be found women of wealth, culture and refine-

ment, who voluntarily assume this unpleasant charge out of pure sympathy for their unfortunate sisters. The largest maternity hospital in the world is the gift to New York city of Mrs. W. H. Vanderbilt, and represents an endowment of over a million dollars.

All over the land are homes of various descriptions maintained by philanthropic women, of the Woman's Christian Temperance Union, The Young Women's Christian Association, churches of every denomination, Protestant, Catholic, Hebrew, etc. These Homes are sheltering thousands of women and girls, and there was some very good reason, which does not appear on the surface, why the World's correspondent was not admitted. Through the persistent efforts of women and after a most bitter fight against men, police matrons have been secured in many of our large cities to care for the women who are taken to the station. These efforts will be continued until all cities are supplied with police matrons. Women in numerous cities are now making the attempt to secure matrons at the jails, in the face of the most stubborn opposition by men. They are pleading for a representation on the boards of insane hospitals, deaf and dumb institutes, blind asylums and all public institutions, in order that they may guard the interests of those of their own sex, and in most cases are being refused by men. When a committee of women in Indiana visited the penitentiaries of this state they found the women inmates in a condition which cannot be described on paper. They went before the legislature with a petition for a separate prison for women. As a result the Woman's Prison and Girl's Reformatory was built, and for twenty years it has been entirely in charge of women, Mrs. Hendricks, wife of the vice-president, being a member of the board all of this time. A similar institution now exists in New York state and in Massachusetts.

In a number of cities women have built lodging houses for women, where they may be safe and comfortable for a minimum amount of money. In the large cities, associations of women have appointed and pay the expense of a woman to remain at the railroad station and look after the unprotected young girls who may come in on the train. From what "enemies" do these girls need protection? Is it from other women? In a number of cities charitable women have established day nurseries where the little children may be cared for, whose mothers are obliged to go outside of home to work. It will be safe to say that there is scarcely a law on the statute books protecting the interests of women in regard to property, wages, etc., that was not backed by the petitions and the personal work of women. They are going before the legislatures every session, in most of the states in the union, endeavoring, usually without success, to have the age at which a child may consent to its ruin raised from seven, ten or twelve years, as the law now fixes it. Are they trying to protect these girls from their common "enemy,"—woman? In many cities women of wealth and influence have organized Bureaus of Justice, to see that working women are not deprived of their wages. The women who for forty-five years have been asking political rights, and suffering a

species of martyrdom in consequence, are actuated by a spirit of pure philanthropy, believing that women need the franchise to protect their own interests and do more effective work for humanity.

The example cited of the woman who discharged a faithful domestic upon learning that she was not virtuous, is not an isolated case. Others of us have known such instances of bigotry, prejudice and uncharitableness, just as we have known of men who discharged men in their service upon finding out that they had been in prison. But where we know of one case of this kind we know of scores of others where women have taken such girls and protected them and helped them to become good and useful members of society. The number of women who follow this latter plan are infinitely in excess of those who would turn such girls adrift.

The defeat of the women candidates in Kansas has been extensively quoted by the papers as an example of what women might expect from each other when they had the suffrage. It will be admitted that, politically, Kansas is in a chaotic state. The proceedings of the last legislature very nearly precipitated a revolution. It was apparent to prudent and conservative people that it was time to call a halt upon what threatened to be a reign of anarchy, and to bring about a readjustment of conditions, if Kansas is to retain the respect and confidence of the rest of the country. The woman spoken of by our correspondent, who received but twenty-five votes, was not a candidate on any regular ticket but ran as an independent. It is to the credit of the women voters that they were not blinded by prejudice to vote for a woman simply because she was a woman, but rather voted their principles. It is a mistake to assert that the women candidates were "snowed under throughout the entire state," for a number of women were elected to office. If women are to vote for women merely because they are women, without any regard to their qualifications for office, just as a Catholic is said to vote for a Catholic and every foreigner for one of his own nationality, they will make a very unwise use of the ballot.

It would take more space than we can command, to enumerate the various ways in which women are manifesting their friendship and helpfulness toward those of their own sex. We believe, however, that if one will study this question from a broad standpoint and not permit himself to be prejudiced by petty individual cases, he will admit that woman is by no means an "enemy" to woman but is her best and most reliable friend. This does not imply that men are not helpful, for, in many ways they are kind and generous to women who need assistance, but it is the worst sort of fallacy to say that "defenseless women should look to the opposite sex for protection." We may be pardoned for using the quotation that "many a man's idea of chivalry is to protect a woman against every man except himself." No woman is ever so situated that she can afford to be without friends among those of her own sex, and it is to them that she will instinctively turn for assistance, counsel and sympathy, and rare indeed will be the cases where she will fail to receive even more than she asks.

## KANSAS WOMEN.

The recent municipal elections in Kansas have attracted wide attention and have been the most convincing object lesson in woman suffrage that ever has been given. The great majority of the daily newspapers have taken much satisfaction in declaring that the franchise should not be given to woman because they did not exercise it to any great extent where they already possessed it. When, a short time ago, the women of Boston registered to the number of 10,000, merely that they might vote for school trustees, and elected their entire ticket, the newspapers were somewhat astonished. When a few weeks later, over 5,000 women registered in Detroit, simply that they might exercise school suffrage, and elected nine out of ten candidates, the newspapers became entirely bewildered. Now, when the returns come in from Kansas, they prepare to climb into the wagon and follow the procession. The *New York Sun*, which has been always bitterly opposed to woman suffrage, says of the result in Kansas:

This is very significant. It indicates that at least a very great part of the Kansas women want the franchise on the same terms as men have it. If the women of the union generally are of that mind, and whenever they make it evident that such is their sentiment, woman suffrage will come without further delay. As soon as women want to vote, they will be allowed to vote. They have only to indicate their desire, to have it gratified. The prospect that woman suffrage will become a question of practical politics at an early day, has grown clearer since Tuesday. At some time or other, women are bound to share with men the responsibility of government by universal suffrage; and that time may be near at hand.

The *New York Recorder*, in a leading editorial, says:

The women of Kansas have certainly dispelled several of the fictions that have so long been used as arguments against the enfranchisement of their sex. It has been said so often that many persons have doubtless been persuaded that it is true, that, if women had the right of suffrage, they would not use it. But the women of Kansas have just gone to the polls in such controlling numbers that this fiction is forever dissipated. In some of the cities of Kansas, they actually registered in larger numbers than men. \* \* \* \*

Another illusion of the anti-suffragists which was destroyed by Tuesday's event in Kansas is that which anticipates that the better element among women will not go to the polls if enfranchised, while the worse element will. The great majority of the women who voted in Kansas last Tuesday were mothers, wives and daughters from the best homes of the state. But the greatest anti-suffrage assumption of all—which is that women, if enfranchised, would not vote their own opinions, but would only multiply by two the relative strength of the political parties as they now exist—received the most complete demolition of all. The Kansas women have overthrown and completely reversed the previously existing political order in that state. \* \* \* \*

Moreover, in accomplishing all this the women of Kansas have proved the utter absurdity of the contention that the presence of women at the polls would result in unseemly scenes of disorder. On the contrary, while the greatest excitement attended the elections of last Tuesday, there was no disorder anywhere at the polls, and the attendance of thousands of women voters put a stop to all brawling around the ballot-boxes, and made the polling booths as respectable places as could be desired. And this ought to surprise no one, because it is safe to assume always that wherever American women congregate in large numbers, American men will behave themselves in a superior manner. \* \* \*

The cause of women suffrage took an immense stride forward in Kansas last Tuesday. The time is ripe for the abolition of the sex line in citizenship.

In eight cities in Kansas more women than men registered. In old conservative Boston we find such influential papers as the *Transcript*, *Globe*, *Traveller*, *Advertiser*, *Gazette* and *Budget* advocating the franchise for women; also the Springfield (Mass.) *Republican*, the Chicago *Inter Ocean*, and other well-known papers. The time when women will have the franchise may be positively predicted:—it will be when the newspapers of the country are ready to permit it. Until the present they have been its relentless enemies, waging war against it with abuse, ridicule and misrepresentation.

---

## CARE OF THE BODY.

---

It is customary among certain people to ridicule the care of the complexion, the hair, the hands and other little niceties that go to make up one's personal appearance. "You'd better be improving your mind." "You'd better be at work," they say; just as if one could not pay a reasonable attention to the details of the toilet and still have time for mental culture and useful work. Every woman cannot be pretty but every woman can be cleanly and neat and careful in her personal appearance, and this goes a great way toward making her seem beautiful. Cleanliness is next to godliness and it only ranks second to any of the other virtues. One frequently wonders, in regard to many of the women she meets, how they would look if they were clean. Physicians say that only those persons are absolutely clean who frequently take a Turkish bath. Where this is not available, there should be baths of some kind as often as possible. They take the place of both medicine and cosmetics. Many a woman who grieves over her poor complexion and spends all her pin money for something to cover it up, could find a remedy in soap and water. Many women will argue that soap never should be used on the face, and others assert that even water should never touch it. They use oils and cold creams and rub off the dirt in that way. Some women have very beautiful skins who follow this plan, but the thought of it certainly offends one's sense of delicacy. A woman who has achieved a national reputation for beauty, which she still retains at almost sixty, has always used bran instead of soap. She simply ties the bran up in a little bag, uses it once or twice and throws it away. This recipe may be recommended. We believe, however, that there is nothing better to secure a fine, healthy skin and good complexion than a thorough washing of the face, neck, hands and arms daily, with a

good toilet soap and hot water, rinsing thoroughly in cold water, drying with a soft towel and dusting lightly with a fine toilet powder.

The veil has been a subject of much criticism but it is valuable in preserving the skin from wind and sun. The state of the health expresses itself quickly in the complexion and the same is true of the food one eats. The loss of sleep and too close a confinement in a hot, dry atmosphere also take their revenge here. Men's complexion can bear more wear and tear than a woman's, for the same reason that a piece of homespun wears better than a piece of silk. A soft, white hand is one of a woman's attractions and, while this is not always possible to one who has all kinds of housework to do, yet the hands can be greatly improved by care. They should not be hastily washed but should be soaked in a warm lather, made with good toilet soap and a pinch of borax, and always thoroughly rinsed, as any soap left in the pores will chap and roughen the skin. The nails should be carefully trimmed, never bitten, and cleaned with something that is not sharp enough to make groves in the inner surface, and then rubbed with a piece of chamois or some soft substance until they shine. This will require only a moment or two. They should be anointed at night with some of the many preparations that are made for this purpose. Equal parts of glycerine and rose water with a few drops of carbolic acid, is an ointment that agrees with some skins but not with others. Cold cream, such as may be bought at any druggist's is an excellent article for the hands and face. A little of it rubbed on the lips before going out in the cold will prevent chapped lips. It is only necessary to sleep in gloves when the hands are in a very bad condition. Push the flesh down from the roots of the nails and train them into a good shape. If the hands are "grimy" with dirt rub them with sweet oil before washing. If they are very rough, rub them thoroughly, while wet with corn meal.

One must also take care of the feet if she expects any comfort in life. Why humanity must be afflicted with "corns" has never been explained. They come to those who have never worn tight shoes, even to those who go barefooted all the year around. A perfect corn cure has never been found. Soaking the feet, softening the corn with salve and removing it frequently, will bring temporary relief. For tired feet there is nothing so restful as bathing them in tepid salt water. A sore joint will be greatly relieved by bathing it in the morning and wrapping it up at night in witch hazel extract. Keep the nails trimmed squarely across the top and scraped thin in the middle, and there will be no ingrowing nails. The good sense of the present generation is manifesting itself in sensible shoes. High heels are a thing of the past, except for ladies in full evening costume. Well-dressed women do not wear them at any other time. Short shoes also are out of fashion and a pinched foot is taken as an evidence of weakness, nowadays. Women are capable of doing some very foolish things in the way of dress but it is probable that they will cling to comfortably-fitting and sensibly-shaped shoes, after having learned their advantages.

## TOPICS OF THE DAY.

---

The New York legislature, by a unanimous vote of both houses, has amended the disgraceful old statute which made fathers the sole owners of their children with power to dispose of them by will, without any consent on the part of the mother. Governor Flower has signed the bill which makes fathers and mothers joint guardians of their children and takes effect immediately. It has taken the law makers of New York a long time to abolish this barbarous statute, and it has been done at last by a legislature which conferred school suffrage on women and seriously considered the conferring of municipal suffrage. There are now six states in the union where mothers have the same legal rights to their children that fathers have,—Iowa, Nebraska, Kansas, Oregon, Washington and New York. Mothers in other states would do well to consider this. .

---

A fund of \$700 was raised through private benevolence in Boston, with which rocking chairs were purchased and sent to the aged and infirm pauper women at the institution in Rainsford Island. The Commissioners refused to accept them and reported that there was already one rocking chair to every three women and that was enough. Herbert Spencer objected to permitting women to have any part in public affairs because they are too tender hearted and would go to extremes in human legislation. It is very certain if women had the power to bring it about they would see that every aged and infirm woman, even if she were a pauper or a criminal, had a rocking-chair in which she could rest her weary old body. All women in institutions should be in charge of other women and not of men.

---

The German writer, Bishof, was very fond of pointing out that women could never stand on an equality with men because the average weight of a man's brain was 1.350 grams, while the average weight of a woman's was but 1.250 grams. After Bishof's death his brain was weighed and found to tip the scales at only 1.245 grams, five less than the average woman's. It takes all the pleasure out of this felicitous joke, however, because we cannot taunt him with it. But perhaps it may have a subduing effect upon some other men, who think, because they have a big head, it means they have also a large brain.

---

The Alabama legislature has appropriated \$15,000 for an industrial school for girls. A Mr. Street, of Gadsden, left \$40,000 for a similar purpose, so that state will be well supplied. Mr. and Mrs. Hadley and the W. C. T. U. of Indiana, are building a large school for teaching girls housekeeping, sewing, dairying, horticulture, etc. Every state should have such schools as these. They would go a long way toward solving the question of what shall be done with homeless

girls, who grow up on the street, taught nothing by which they can make a living and almost to a certainty doomed to destruction.

---

The New York Exchange for Woman's Work was established in 1878, to secure a sale for the work of women, to provide employment and to furnish legal counsel when they needed it. It has sold more than a million-and-a-half dollars worth of work for women, established 74 exchanges in the United States and one in Europe, and assisted almost a countless number of women.

---

A remarkable feature of the present year is the spectacle of three women candidates for the United States senate, Mrs. Lease, of Kansas, Mrs. Bartlett, of Wyoming, and Mrs. McCormick, of North Dakota. Undoubtedly the generation is now born who will see women in that exalted position.

---

THE Illinois senate passed a bill giving township suffrage to women, by a vote of 27 to 10. The Arkansas senate passed a bill giving school suffrage to women and making them eligible for school trustees. The Colorado legislature has passed a bill which has been signed by the governor, submitting an amendment for full suffrage for women. The California legislature passed a school suffrage bill by a vote of 70 to 34, which was vetoed by the governor. He stated that he favored the measure but was opposed to the way the bill was drawn. The Minnesota senate has voted, 26 to 14, in favor of extending full suffrage to women. The legislature of Ontario, where women have had municipal suffrage for years, is about to confer upon them the full parliamentary suffrage. In England the prospects are favorable for the passage of a bill by parliament giving women the right to vote for members of parish councils and to serve as members.

---

THE *Ladies' Home Journal* publishes a number of opinions from distinguished women as to whether they prefer to be addressed by their husbands' or their own names. We should suppose this depends on whose name carries the most weight. If a woman is living a quiet, domestic life, with no particular claim for public recognition, it seems proper that she should be spoken of as Mrs. John Smith. If, however, she has done such work as makes her better known than her husband, she has won the right to be addressed as Mrs. Mary Brown Smith. We would like to see the universal custom of a woman's always retaining her maiden name as a middle title. It preserves her individuality and enables the friends of her girlhood to recognize an old acquaintance by the name.

WE find among our new exchanges "*The Christian Railroader*," published at 144 Webster street, Allegheny, Pa., J. W. Vickerman, Editor. It is a pleasure to commend this paper. Every article in it is bright, entertaining and wholesome, and it would brighten a home like a bouquet of fragrant blossoms. If true merit can win, its success is assured. It is published monthly at twenty-five cents a year.

---

THE Kansas legislature passed a bill empowering police commissioners of first class cities to appoint police matrons. The Arkansas legislature, after twenty attempts were made to secure it, passed a bill raising the "age of consent" from 12 to 16 years. In Tennessee, after a bitter fight by its friends, the age was raised from 10 to 16 years.

---

#### WOMAN'S WORST ENEMY.

---

It is not my desire to enter into a controversy with any of the contributors to this department, especially when the subject is one which, like the religious question, may not be settled by controversy. My object in venturing into this department is to merely offer a few facts bearing upon a question which has been discussed by some other of your contributors, and which would seem to indicate that the article captioned "*The Unvarnished Truth*" contained some truth which was not altogether unvarnished.

There is quite a common impression abroad that woman's worst enemy is woman; without attempting to either concede or deny the correctness of this sentiment I shall offer a few well attested facts which are of the nature to inspire mankind with the belief in its truth. The New York *World* employs women as well as men upon its reportorial staff. One of the former was recently assigned to the peculiar and disagreeable task of walking the streets of New York from the rising to the setting of the sun, clad in the garb of an unsophisticated country girl. Her experience was both novel and interesting. She found that a young woman can walk the streets of New York without being addressed by men, providing she offers no encouragement to that class of humanity who regard street walkers as legitimate prey. She was sometimes followed by men of this class but not once insulted. She found the police officers unremittent in their efforts to protect defenceless women from the dangers they are liable to encounter. She found that her inquiries for a lodging house were respectfully and truthfully answered by men, but that women as a rule evaded her, and in some cases paid no attention to her importunities. She found that she was unable to procure a bed in the refuge of that charitable society, the Young Woman's Christian Association, neither could she obtain any advice from the matron in charge directing her where to go. Her adventures were written down by herself and published in the *World*, and her conclusion is that defenceless women should look to the opposite sex, rather than their own for protection.

A case which came under my own observation some years ago is as follows: A young girl was betrayed by one of those beasts who sometimes take the form of men. It was the same old story; she was abandoned by her betrayer shortly before giving birth to a child. The child, fortunately, lived but a few hours, and leaving the scene of her disgrace this young girl obtained a situation as a domestic in a distant city. For ten months this girl filled her situation to the

complete satisfaction of her mistress; during that time the breath of suspicion was never directed toward her; she was regarded as being above reproach and without a stain upon her virtue. Her mistress formed the acquaintance of a woman who resided in the neighborhood of the girl's home and who knew her antecedents. This woman paid a visit to the girl's mistress; the girl—who had tried to hide her identity under an assumed name—was recognized and her story told. Did the mistress under whose roof she had spent nearly a year without the breath of scandal ever reaching her, sympathize with her and offer to aid her in her attempt to blot out the past? Nothing of the kind! The edict went forth, "Pack up your duds and get out, I want no strumpet beneath my roof." When last I heard of this poor girl, she was an inmate of a house of prostitution. I should not like to be called upon for an opinion as to who was responsible for her miserable fate.

A case of a different nature is this: Women are allowed to vote—and it should be a universal custom—in the municipal elections in the state of Kansas. In Kansas City a woman of high social standing was a candidate for mayor; over 3,000 of the 10,000 votes cast were deposited by women, but the name of this woman who aspired to municipal honors was found on but twenty-five of the tickets when the ballots were counted. If this had been an isolated case we might easily ascribe it to local causes, but throughout the entire state we observe the same result, the women candidates were snowed under by their own sex. Does woman bear a grudge against woman, or does she pretend to a higher degree of virtue than she really possesses?

*Wilfred P. Borland.*

### PARKS.

The time has nearly come when once more nature will put forth her beautiful foliage, and flowers will blossom in rich profusion and the many thousands who have been shut up between brick walls, in our large cities during the winter, will seek pleasure and recreation in the various beautiful parks which a wise forethought of our city governments has provided.

Perhaps no city in the union has just such parks as has Kansas City. The city itself does not own any park ground, except two little pieces which have been donated for park purposes, but have always been in litigation, and consequently not improved, but the street car companies have furnished four beautiful parks at the terminus of each respective line—two of them can be reached with a five cent fare and the other two, fifteen cents for the round trip—each one contains an artificial lake, boat house and boats for hire, swings, pavilion for dancing, and music certain afternoons and evenings, lunch counters where everything for a good lunch can be bought, or tables, chairs and beautiful shade for those who prefer to take their own lunch; beautiful beds of flowers here and there adorn the grounds, and dry walks for damp, rainy weather, but the greater portion of the ground is left in its natural state, where those who wish can stroll off and be in the woods. The companies keep up all the expenses and receive their returns by the patronage on the trains to and from the parks.

I had a strange experience at one of the parks last summer. Our dear boy was then running an engine, as engineer, on the Independence dummy, which road runs past Washington park, and one Sunday we left home early to take a ride on his train and return before the afternoon crowd. We walked around the beautiful grounds enjoying the quiet, and watching the children running and playing, for many families were out there with their lunch baskets, and I thought that it was pretty to see fathers, who worked hard all the week, taking their wives and children out with them for a day's recreation. Now don't be too hard on me my dear church goer. I used to think just as you do, and was brought up just as strictly, but circumstances change many things. If

you have plenty of leisure, and are your own master, then, I say stay at home on Sunday, except to go to church, and visit the parks on a week day; or better still, if you are rich, go to Cape May, Coney Island or Martha's Vineyard for the summer, and forget that there is such a thing as church until you come home. Your church was closed during the heated term while you were away, so if you had been home you could not have attended, but while you were away enjoying the cool ocean breezes don't grudge your stay-at-home neighbor the few Sundays that he spent with his family in the parks. He was in good company; the flowers, the singing of the birds, the lovely shady trees, the soft velvety grass, and the gentle summer breeze, all spoke to him of nature's God, and where better can he study nature than in her own green groves. But I have digressed. I at last grew tired and sat down under one of the many shady trees, when presently I heard voices coming towards me, and a peculiar sound arrested my attention, a different voice from any I had ever heard before.

"Why Susie, what is the matter with you? Your eyes look dull and heavy, and your usually glossy hair looks dry and rough. What have you been doing to yourself?" "Well, Bossey, I am sick, and I think that I know what is the matter with me. You see, a little while ago I was lying down in the shade chewing my cud, as I have always done, feeling so well and happy, when a party of those two-footed animals, which we now see so often, came along and they were all jabbering and chewing *their* cud, and I wish that you could have seen them; they opened their mouths so wide that I could almost see what they had for breakfast, and they did look so horrid with their jaws going all the time, I thought if I looked that way chewing my cud, I would just give it up, for I do love to look nice, but I have been sick ever since, and I don't think that I have improved my looks." "Well Susie, I should say not. You foolish creature, don't you know that nature gave us our cud to chew, and we have always been admired so much with our big eyes and glossy hair lying down chewing, but those two-legged creatures have no cud of their own, and have to buy one, and if they want to spoil their looks and stomachs by chewing a false cud, I would not spoil my looks by not chewing the one which nature gave me," and with that Bossey gave a loud bellow. I jumped to my feet and there stood my husband laughing at me. I had been asleep.

KANSAS CITY, MO.

Mrs. W. L. Wheeler.

#### WOMEN MUST CO-OPERATE.

Well, here I am again, asking admittance, promising not to consume too much valuable space if admitted.

We have entered upon another year, and can look back to the one that is gone, without regret; but let the lessons we received in this bygone year be written upon our minds. The last year has wrought a material change to the social and political position of women. Never was this more plainly shown than in the last campaign, in which women took a most prominent part. This partial success should not satisfy them, but only encourage them and drive them on to fight with more energy and zeal for their cause. One of the most necessary conditions to successful warfare is a well trained army, not only officers, but every common soldier must be trained, and just as physical development comes from physical exertion, so mental development comes from mental exertion. Let this be a lesson to women in their struggle for independence. The mental development and physical training by co-education is one of the most needed improvements to the recruits of the vast army of women fighting for equal suffrage. But bear in mind, that however well trained one individual may be, unless he joins some army and works and fights under some established rule, he will not be able to do much good. So women, join your regiment, I mean some order or society and co-operate with it. This is the best and surest way to success.

BENNETT, PA.

John Shradle.

## EMPLOY HELP.

In looking over the Woman's Department of the MAGAZINE for several months past I find various ideas expressed on the caption of this article. Let us glance at a few: One writes, "If you are only seventeen keep a hired girl." While another says she does all the work for four grown up brothers, and still others do not wish to be "dressed up doll babies."

Well, "All's well that ends well." Some women are constitutionally strong while others are quite the reverse. If a woman is strong and can do all her own housework, properly train her children, have time for mental improvement and other recreation and still not be overtaxing her strength, why, it seems rather extravagant to keep a hired girl. But I think the average American woman is hardly able to do all this. Not but that she has brains enough, but to be continually overworking does not improve any one mentally or physically. On the other hand, if a woman is well but not naturally strong, has a small family (only herself and husband, perhaps one child,) she can take advantage of her work if she understands how. Never lift a full teakettle, have a dipper or pitcher and pour the water into it. Never lift the hod when it is full of coal, put in the coal with a little shovel. You never put on a hod of coal at one time, why lift all that extra weight? Then there are a great many kinds of work that can be done just as well and just as quickly sitting as standing. By so doing you won't be any "lazier" but will save your strength for something else.

Perhaps you say, it takes more time and steps, but wait until you have formed the habit and then notice the difference. Some women seem to glide about the house and do their work as if by magic, while others make a great rush and splurge and really make as much as they do. Consequently they have a double portion to perform. This is a matter of tact, perhaps talent with the one and of habit with the other. But I think we can cultivate moderation and temperance in all things.

If one has a large family and is not strong I should say keep a hired girl and economize in dress, for one thing, (for I think a great many of us are prone to be a little extravagant about this matter.) Have good warm clothing but not necessarily expensive. It seems to me it is better for a wife to be a companion to her husband, rather than to spend her time about her house work the first part of her married life and in later years to become an invalid, or worse, not to exist at all, leaving a husband with a weed on his hat and three or four little children, and him trying to care for them himself or perhaps hunting up a housekeeper.

Would like to hear from some of our readers on dress reform and the national costumes of Mrs. Jenness Miller.

*Marie Robbins.*

GREENFIELD, MASS.

[Please permit me to express my appreciation of your kind and sympathetic words in private letter.—Ed.]

## WAITING.

What matter where I dwell, beneath what skies      The brooks, that murmur as they flow along,  
Or summer's blush or winter's snows I see?      The trees, that rustle in the cool, deep grove,  
By night, the stars are as thy dusky eyes;      The birds, that fill the dreamy air with song,  
By day, the zephyrs whisper low of thee.      All, all are sighing of an absent love.

And I? Through all the lagging hours I pray  
That Fate, ere long, may kindly smile on me,  
And end my waiting with the wished-for day  
When fortune speeds me homeward, and to thee.

*Frank G. Heaton.*

JUNE, 1893.

## RICKS AND TAFT IN THE SENATE OF THE UNITED STATES.

The promptness of the action of the United States Senate with reference to the decisions of United States Judges at Toledo, Ohio, indicates how intense and far reaching is the opposition to such decisions. Hon. Daniel W. Voorhees, the senior senator of Indiana, on April 7, introduced the following resolution:

In the senate of the United States. April 7, 1893.  
Referred to the Committee on Interstate Commerce and ordered to be printed. Mr. Voorhees submitted the following resolution:

Whereas, The tenth section of the act of Congress approved February fourth, eighteen hundred and eighty-seven, known as the Interstate commerce act, contains the following enactment:

"That any common carrier subject to the provisions of this act, or, whenever such common carrier is a corporation, any director or officer thereof, or any receiver, trustee, lessee, agent, or person, acting for or employed by such corporation, who, alone or with any other corporation, company, person, or party, shall willfully do or cause to be done, or shall willingly suffer or permit to be done, any act, matter, or thing in this act prohibited or declared to be unlawful, or who shall aid or abet therein, or shall willfully omit or fail to do any act, matter, or thing in this act required to be done, or shall cause or willingly suffer or permit any act, matter, or thing so directed or required by this act to be done not to be so done, or shall aid or abet any such omission or failure, or shall be guilty of any infraction of this act, or shall aid or abet therein, shall be deemed guilty of a misdemeanor, and shall, upon conviction thereof in any district court of the United States within the jurisdiction of which such offense was committed, be subject to a fine of not to exceed five thousand dollars for each offense."

And whereas, it is alleged that said section of the law, as it now stands, has been construed by the judges of the circuit and district courts of the United States, in recent decisions at Toledo, Ohio, to mean that "the duties of an employee of a public corporation are such that he can not always choose his own time for quitting that service," but that in attempting to leave the employment of such corporation of his own free will, and to escape from its

control and consequent servitude, such employee is guilty of a misdemeanor and liable to severe penalties: Therefore,

*Resolved*, That the Interstate Commerce Committee of the senate be, and is hereby, instructed to inquire into the question here presented, and to report to this body what action may be necessary, either by the repeal of said tenth section of the existing law, or by the enactment of additional legislation for the better protection of the laboring people of the United States in their natural and inalienable rights, and for their greater security from the encroachments of corporation power.

We do not doubt that the influence of Thomas W. Harper, Esq., of Terre Haute, who visited Washington immediately subsequent to the decisions of the U. S. judges at Toledo, in the interest of the brotherhoods directly involved in the Toledo imbroglio, brought about action in the senate. Mr. Harper fully comprehends the legal aspects of the case, and was confident the gravity of the matter would result in action.

It may be well for the readers of the MAGAZINE to know some of the utterances of senators upon Mr. Voorhees' resolution.

Senator Gorman, of Maryland, referring to the Toledo decision, said:

Then the other matter—and I speak about this with great freedom—the recent decisions of courts of the United States, that under the act of congress regulating interstate commerce, the act prohibiting combinations and pools, they have the right to determine not only what a man shall do, but what he shall not do when he is an employee of a railroad company. It is the first great step in this country of the judicial branch of the government to absolutely take possession of the railroads and of the men who are the employees of corporations.

If the law warrants the decision, and possibly it does, then the law ought to be modified or repealed. I do not believe that the people of this country will ever submit from any branch of the government, whether the judicial or legislative, to such restrictions as have been placed upon them by these recent decisions. The late chairman of the committee on interstate commerce [Mr. Cullom] since the committee was created in this body, and every member of it, and I have been a member from the organization of the committee, had not the slightest conception that, by that act or the bill introduced by the distinguished senator from Ohio, and afterwards reported from the judiciary committee, it was intended to give such power to the federal judiciary.

Mr. Hoar. Will the senator specify a little more fully (and what he says is very interesting) the point he has specially in mind?

Mr. Gorman. I mean to say that the recent decision of the courts, that employees of railroad corporations could, by order of the courts, be restrained from quitting the service of the corporation; that they cannot resign their position as engineers, or other employees of the company; that not only are combinations to obstruct interstate commerce a misdemeanor, but that a single man, quitting work on his notion, is a violator of the act, is a most extraordinary decision. If the act of Congress warrants it, then we must meet that question at the very beginning of the next congress. It ought to be inquired into carefully by men who have but one motive, that of protecting the great interstate commerce, but that in doing so it shall amend the law so that the liberty of the employees shall not be unduly restrained. The judges of the United States should not be armed with such power as to make them czars.

Senator Voorhees in discussing the matter embodied in his resolution, said:

Mr. President, a few mornings ago my attention was called to the subject under discussion by pub-

lications that have not been alluded to as yet in this debate. These publications purported to be verbatim reports of two judicial decisions, one by Judge Taft, of the circuit court of the United States, and the other by Judge Hicks, of the district court of the United States for the northern district of Ohio, rendered at Toledo. Those decisions prompted the resolution which I then introduced, and which is now partially at least under discussion. In that resolution I set out the tenth section of the act of congress approved February 4, 1887, known as the "interstate commerce act." Sir, I am satisfied that section goes further than any one supposed it did at the time of the passage of the act, unless perchance some person or persons interested in having a sweeping and oppressive enactment that would practically chain a railroad employe to his car, to his locomotive, at the behest of the corporation, dictated the provision and had it put in.

Mr. President, instead of discussing Judge Speer's decision, which is noticed in this morning's paper, I shall briefly discuss the decisions that have been made in Ohio, as I understand. I read the decision of Judge Speer this morning, and it is subject to the comments made by the Senator from Missouri [Mr. Vest]. The headlines are much stronger than the body of the decision. The proclamation at the head is much more pronounced than the text. The text does not sustain the announcement which precedes it, but it does not follow that the decision should therefore be criticised. I think the main fault is in the law itself, increased and aggravated in some instances by the willingness and eagerness with which federal courts construe laws in favor of corporate power and against labor in this country.

The greatest and most dangerous question to-day is the encroachments of corporation power, colossal consolidated wealth against those that are helpless in its presence, powerless, and who have to obey its mandates to get bread and to live.

Sir, let us see what it is that is under consideration. Having set out the tenth section, let us see for a moment what it contains. Without going into detail, I say here as a lawyer, it provides that if an employe of a public corporation, either alone or in company with others, leaves the employment of such corporation at a time of his own choosing, he is liable to be prosecuted, convicted, and fined heavily for a misdemeanor.

If a solitary individual, not engaged with numbers or conspiring with others or moving in a strike, but for himself alone, sees fit to leave the employment of his corporation master, he can be held under this law and prosecuted. Having stated in general the scope of this section, this terrible section for the enslavement of laboring people, the resolution which I had the honor to introduce, proceeds to say:

"And, whereas, it is alleged that said section of the law as it now stands has been construed by the judges of the circuit and district courts of the United States in recent decisions at Toledo, Ohio, to mean that"—

Then I quote the language that was set out in the decisions, and reported some days ago in the newspapers, it is true, but I take it for granted there was no motive to mis-state a single word of the decisions and that they are substantially correct as I have quoted them here—

"the duties of an employe"—

This is the language of the decision. That—

"the duties of an employe of a public corporation are such that he can not always choose his own time for quitting that service, but that in attempting to leave the employment of such corporation of his own free will and to escape from its control and consequent servitude such employe is guilty of a misdemeanor and liable to severe penalties."

To be prosecuted for a misdemeanor and fined heavily!

Now, Mr. President, whatever else may be said, that is a law, as interpreted by the courts, which chains a laborer to his engine and his car as completely as the galley slave was ever chained to his

oar. It prohibits his departure from his work. It says that once enlisted he has become bound as a private soldier in the army; that if he leaves his post he is to be punished as a deserter.

Mr. President, when such an issue as this is presented we have reached a point in this country where it becomes us to pause and retrace our steps. I heartily concur in the remarks and respond to the tone of the senator from Maryland, who so strongly stated the grasping power of the federal judiciary of this country a few moments ago; but before denouncing the Federal judiciary for its encroachments on the laboring classes let us clear our own skirts.

Let us see that no law long remains on our statute books, put there however it may have been, which punishes an individual laborer for leaving the employment of a corporation or of any other employer. Whoever heard of such a law before? One individual employs another individual and the individual employed can leave when he pleases. Has a corporation become such a master that it can say to those under its employment that they shall remain there indefinitely? An employe cannot always choose his time, the decisions say. Can he choose it at all? If his own choice does not govern, he must of course ask permission of a master whom congress and the courts have established over him. To hold a man's person for the specific performance of personal service is the direct enactment of involuntary servitude in this country.

An action for damage is the only remedy ever known in a free country for the violation of a labor contract. The claim now for the first time in this country put forth that the laborer can be bound by law to continue in service after he has made up his mind to quit is the principle on which peonage, serfdom, slavery are founded wherever they exist on the face of the globe. No graver question than this has ever appeared here. It touches the very foundations of free government, and involves the liberty and happiness of meritorious millions upon whose labors the prosperity of this country depends and whose protection should be the first care of the American Congress. These sentiments are not new with me. They are as old as the years of my political life, and will only cease to control my action when all action is ended so far as I am concerned.

Sir, such were the considerations which induced me to introduce this resolution, instructing the committee on interstate commerce to inquire "what action may be necessary, either by the repeal of said tenth section or by the enactment of additional legislation, for the better protection of the laboring people of the United States in their natural and inalienable rights, and for their greater security from the encroachments of corporation power."

I know very well what may be said on the corporation side of this discussion. I will answer in advance. Nobody pretends that an engineer can fling himself from his engine and abandon it en route and in motion, thus endangering life. Such an act would be a criminal attempt to wreck a train, and has always been punishable by the laws of every state in the Union and of the whole civilized world.

That is not, however, what is meant or contemplated by this law. The law as construed by the courts, says the employe can not alone or in company with others, though in an orderly way and in the exercise of what we have heretofore thought to be natural and inalienable rights, sever his connection with a corporation. It is decided that he has enlisted to stay, and he is to be punished as a deserter if he leaves his post or attempts to cast off the badge of his servitude.

Mr. President, I have not much to say in regard to the judiciary itself. When bad laws are enacted, by mistake or otherwise, some judges are glad to mitigate their evils; evince no pleasure in their enforcement; point out with gentle hand the errors they contain, and make the injury they inflict as light as possible. On the other hand, there are judicial minds that grasp at power, love it for for its own sake, enforce it ruthlessly, and ignore the safety and protection of the people. The old distinctions here at once arise between a strong federal government and a government resting on

the consent of the people. Jefferson, the great apostle of popular liberty, foreseeing such dangers as are now upon us, proclaimed in his day that the federal judiciary were the sappers and miners of constitutional liberty. So they are, such of them as with a greedy thirst for power delight to enforce laws of the kind we are now considering.

I think, Mr. President, that the committee on interstate commerce could not be better employed than in making inquiry into this dangerous question where friction comes between corporation power and the humble though strong and patient multitude of laborers of this land. We are going in the pathway of nations who have gone before us. Old history is being re-enacted day by day. The grasp of wealth, the consolidation of capital, coming here from year to year and obtaining legislation, putting manacles as it were upon the labor of the land, is nothing new. It has happened before in other lands and ages, and with its growth personal liberty and the institutions of free government have perished by the wayside. If this government is to be overtaken by calamity, if there is to be revolution, change in its substance and form, it will come upon this vital point more quickly than on any other within the scope of my mental vision.

The discussion took a wide range, and the indications are that United States judges will not be permitted to play czar in the United States, and, in alliance with corporations, remand workmen into slavery. The time has come to call a halt, and the senate did not fail to see the necessity of the resolution of Senator Voorhees.

### JUDICIAL JUGGLERY.

The two distinguished necromancers who have been exhibiting along the Lake Shore, from Cleveland to Detroit, and particularly at Toledo, have furnished entertainment for a large number of people beyond the audiences before whom they appeared. The tricks played by the jugglers had the charm of novelty, and as wizards, with a big W, Messrs. Taft and Ricks have gained not a little notoriety. Coming upon the stage with their wands, bottles, balls, and other fakir paraphernalia, their appearance elicited applause from box, pit and gallery, and bowing their appreciation of recognition, they proceeded to perform the tricks of the program, designed to tickle the corporations, daze workmen, astonish lawyers, interest the press, and even arrest the attention of the United States Senate, the most august deliberative body in the world.

This jugglery of Messrs. Taft and Ricks reminds us of the far away days when kings wanted to know, not only what they had dreamed, but what their dreams portended to themselves and their kingdoms; whereupon, they called around them their soothsayers, magicians, astrologers and sorcerers, and demanded of them to explain matters, and the poor devils, to save their heads and their salaries, concocted stories, which, with any amount of tweedledum and tweedledee, sufficed to quiet their masters, for which they received special rewards, and when they retired to "chambers," enjoyed themselves immensely upon their success. And,

notwithstanding we are supposed to have made astounding progress since the days of Nebuchadnezzar, the soothsayers are still in demand, but the jugglers are now called judges, and when a corporation dreams of a first class method to rob and oppress workmen, the juggling judges are called upon and are required to give such opinions as their masters require to enable them to *honestly perform* their duties to the public.

Messrs. Taft and Ricks, the U. S. jugglers, have adjourned their performances "in chambers" and in halls, the final trick being to explain their tricks, in doing which they have, with rare success, mystified every artifice of their performance, and practiced the greatest diddle on the program. The blind, "now you see it" and "now you don't see it," was worthy of the wizards, and they smiled to see the astonishment produced by the cheat upon the audience, except the corporation bosses, who seemed to be in possession of the right "tip," but when others, including lawyers, inquired what of it? the response was "damfino."

The labor of the mountain that produced the mouse seems to illustrate the situation, or the exclamation of the devil, after shearing a hog, "Great cry and little wool!" might be regarded the more expressive criticism. But the performance is over, and the jugglers, having found gimlet holes through which to retire, may now be found, doubtless, "in chambers," planning new tricks with which to please corporations and make the "groundlings" stare.

### GEORGE W. CHILDS AND THE PHILADELPHIA PUBLIC LEDGER.

On April 24th, the Philadelphia *Public Ledger*, changed its form from folio to quarto, and now contains 20 pages, and is about the size of the New York *Herald*. In this change the *Ledger* has improved its form, in other regards, improvement is not required and is not demanded.

George W. Childs, the owner and publisher of the *Ledger*, stands in the very front rank of the newspaper men of the country. His success in that line of endeavor is really phenomenal. The labor world admires him for his common sense, philanthropy and the unwavering justice which characterizes all his dealings. Rich in money he is and desires to be, but he is a millionaire in noble, generous deeds and in all that pertains to making the world better and more beautiful and life worth the living. Wherever he journeys he will find hosts of friends who will vie with each other to make him happy, and the *MAGAZINE* joins most heartily in the wish that his life may be one of as much sunshine as Providence ever vouchsafes to the few, who are good because they are built that way.

## THE ANN ARBOR STRIKE.

Under the above caption Grand Master F. P. Sargent contributes the following excellent article to the *North American Review* for May:

A strike is a declaration of war. It is therefore the policy of the Brotherhood of Locomotive Firemen to discourage strikes, and adopt other methods for the settlement of disagreements with employers, strictly in accordance with common sense, always having in view the welfare of the parties to the controversy. To verify this statement, it is only necessary to refer to the constitution and laws of the brotherhood, which are eminently conservative and democratic.

The laws of the brotherhood recognize the sovereignty of the membership. They confer no arbitrary power upon the chief executive of the order. He cannot "order" a strike. He cannot "call out" the men. He cannot arrest the business of railroad. In this connection, it may be prudent to briefly outline what is required to engage in a strike. First, a grievance committee states definitely to the proper officials of a railroad the particular wrongs which it is desirable to have corrected. If the official to whom application is made gives audience to the committee, matters are fully discussed and in a vast majority of cases a satisfactory arrangement results. If, however, an agreement is not arrived at, the chief executive of the order is notified, and, when made entirely familiar with the situation, he takes up the case and presents it, if permitted, to the highest official of the corporation. If a conference is granted, the grievances are discussed and earnest efforts made, on the part of the brotherhood, to reach satisfactory conclusions and if possible to avoid a strike. Concessions are usually made and compromises agreed upon, but if, finally, no agreement results, a strike does not, necessarily, occur at once. On the contrary, the laws of the order require that the road or system be canvassed, for a strike cannot be declared unless two-thirds of the men interested vote in favor thereof, and then only then sanctioned by the Grand Master in conjunction with the committee having the matter in charge. It will be observed that the brotherhood has adopted, to the extent of its power, wise precautions against everything hasty or ill-advised, calculated to precipitate a strike.

In the case of the strike on the Toledo, Ann Arbor & North Michigan Railroad, which occurred on March 8th, every precaution here outlined was taken, and every movement on the part of the members of the order was deliberate and lawful. There was not an instance of insubordination; nothing turbulent or seditious. Men had appealed to their employers like men, to have serious and grievous wrongs redressed in a manly way, as became good and law-abiding citizens. They had been overworked and underpaid. Their employers had violated contracts and had subjected them to outrageous treatment, and mocked at their complaints. Their pleadings and protests had availed not, and when endurance and patience had ceased to be virtues, when all efforts to find redress had utterly failed, then, and only then, did they strike; only then did they assert their manhood, their rights as citizens and abandon their work, preferring idleness and the sacrifices which idleness entails, to the degradation which injustice and insolence force upon the unresisting.

I am writing, as is my province, particularly for the Brotherhood of Locomotive Firemen, though entirely familiar with all the acts and movements of the Brotherhood of Locomotive Engineers, which, owing to its law relating to boycotting railroads, has had special prominence in this strike. I may state, however, that the laws relating to strikes are practically the same in both brotherhoods, with the exception of the law providing for boycotts, which the Firemen's Brotherhood omits.

The strike on the Toledo, Ann Arbor & North Michigan Railroad had no extraordinary features, but the interferences of the United States judges have given it national prominence, and if the dictum

of these judges is to stand as the law, the dearest rights of the citizen are swept away and an autocracy is established. This view of the situation is not strained, but is strictly in consonance with the avowals of the press throughout the country. The questions of law involved are fundamental and are commanding, as they should command, the best thought of the nation. It has hitherto been conceded that railroad employees possessed all the rights as citizens which attached to their employers, that is to say, that if employers possessed the right to discharge employees, when it pleased them to exercise such authority, the employee also possessed the right, unchallenged, to quit work when he elected to exercise that right. If a judge of a United States Court may abolish this right of an employee, he commands him, unequivocally, to a servitude as degrading as the Spartans imposed upon their helots, and it is this phase of the strike which aroused such intense concern and alarm.

It will not be expected that I should enter upon a discussion of the legal points involved; at best I can only voice the sentiments of a body of law-abiding men who have been trained by their organizations to respect laws and the decisions of courts, and who find themselves suddenly reduced to the condition of peonage by the decision of a United States judge. The learned judge, in his decision, finds it convenient to omit all reference to the duties of railroad magnates, and devotes his attention to employees, intimating to them that, having sought employment upon railroads, they have become, by some legal hocus pocus, a part of its machinery to remain during the pleasure of their employer. In handing down such a judicial opinion, the judge seeks to bury out of sight the inalienable right of a railroad employee to liberty and the pursuit of happiness. If an engineer, he is welded to the throttle of his engine; if a fireman, he can lay down his pick and scoop only when his master gives him permission. The interstate commerce law is invoked, it is true, and the whys and wherefores of the boycott are involved, but the judge, disdaining to be exact, gives employees to understand that once becoming engineers or firemen they part with their rights as citizens and are links in a chain gang of railroad employees, because they are in some sense public servants, and the exercise of the prerogative to quit work is productive of inconvenience. But it will be observed that no reference is made to public needs or inconvenience, when an official, without notice or warning, at his own sweet pleasure, discharges an employee.

It has been suggested that a railroad employee, when he accepts service, enlists—something after the manner of a private soldier in the regular army of the United States—placing himself under the control of officers, from corporal to the commander of the company, regiment or division, and therefore can neither quit nor resign, but is held by some mysterious power recently discovered by a United States judge. True, it may be, that neither railroad men nor the public profess to understand clearly what the judge means, but the best efforts that have been made to comprehend his declarations lead to the conclusion that they restrict the rights of employees and indefinitely enlarge the rights of employers. For myself, I do not regret that a United States judge has forced upon public attention questions of such acknowledged gravity. The time has come for workingmen to know if they have any rights which the courts are bound to respect, or if these rights may be at any time abrogated to meet the demands of corporations or the combined capitalistic power. The United States judge at Toledo has started the controversy, and I desire to have it proceed until the unquestioned rights of railroad employees, if rights they have, are established, as also the rights of their employers.

It is asserted that railroads become common carriers, but are unable to perform their obligations without men. They must have men, and it should be stated they must have engines, fuel, water, steam, tracks, switches, etc. The locomotives and equipments can be purchased and become the property of the road, but they are useless without the men, and these, once secured, the general manager, speaking as if by authority, intimates that they be-

come fixtures, because without them, as without engines, the obligations of the railroads cannot be performed; such is the new-fangled logic relied upon to reduce railroad trainmen to machines, to do the bidding of masters with authority conferred by a United States judge.

It is not surprising, therefore, that this strike created intense solicitude throughout the country. It is held, so far as the men can discern, and many of them are thinkers of acute penetration, that the rights of workmen are in imminent peril. In at least one notable instance a United States judge has shown his utter contempt for a sovereign state and the laws made in conformity with the constitution, and has sent county officials to prison, because they would not disregard their oaths and obey his mandate—and it will be readily conceded, if such high-handed outrage can be perpetrated and the judge remain unimpeached, that a judge may, with equal impunity, subject railroad employees to autocratic indignities. Such acts on the part of judges may lead to a movement to define the limits of judicial power, since, if it is as far-reaching as I have indicated, the demand to know the worst will grow in emphasis until the worst is known, and the present is as favorable a period as will ever occur in the history of workmen or of the country for adjustments and readjustments.

A railroad man myself, knowing by experience the duties of a locomotive fireman, and speaking as I do for an order whose membership reaches thirty thousand men, it affords me special pleasure to place upon record the fact that the great body of these men comprehend the value of railroads to the country. They have not in the past, nor are they now, making any demands upon railroad corporations not warranted by justice and fair dealing, nor do they stand in need of any lecturing from a United States judge, or any other ermined representative of the law to teach them their duty. These locomotive firemen are profoundly interested in the growth and expansion of American railroads, they desire their prosperity, because their own welfare is identified largely with their triumphal march; but if railroads, under the decisions of courts or any other power, are to batter down the rights and prerogatives of employees, if the workmen are to witness the creation of a cabal of petty tyrants, and find themselves shorn of privileges hitherto regarded as birth-rights, then, in that case, it were better that no railroad track had ever been laid, better that the wilderness should be restored and the land given back to wild men and wild beasts.

One of the most conservative papers in the country, referring editorially to the declaration of a United States judge, says that "The decision of the United States Court at Toledo, O., to the effect that railroad employees can be compelled to perform the service for which they are employed, regardless of the orders or regulations of any labor organization, is a very important one in its bearing upon the relations of employers and employees. It makes a distinction between such workmen and those engaged in other forms of industry on the ground that their service is of a public character, and that society is particularly interested not only in the way in which they perform their duties while they continue in that service, but also in the time and circumstances under which they quit such employment. They have not the right, Judge Ricks tells them, to choose their own time and place for terminating their service. 'Your employers owe a high duty to the public,' he says, 'which they are compelled to perform under severe penalties of the law, and they have, in turn, a higher claim upon you and your service than that due from the ordinary employees.'" And after some further comment, the remark is made that "This is a new judicial departure, and its outcome will be awaited with general interest." It is this "new departure" that contains the germ of an odious autocracy created specially for the degradation of a special class of railroad employees. No wonder that the writer declares that "its outcome will be awaited with interest." The expression "general interest" puts the case in its mildest form. The language of the judge, it would be prudent to say, creates general alarm; like the phenomena that precede cyclones

and earthquakes, it presages other troubles, compared with which the Toledo strike will be insignificant.

Fortunately, it is held that the court has assumed authority which it does not possess; that its dictum is extra-judicial; that it does not possess the authority to reduce men to machines or to a commodity; that rights acquired by revolution, war and legislation cannot be crushed and overwhelmed by a District judge at his pleasure. But it so happens that while men debate such propositions, embodying self-evident truths, the court, with an iron grip, holds freemen in bondage, and the victims are as powerless as when, under another exhibition of power, men were sold at the auction block.

I am not disposed to criticise railroad corporations or railroad officials. My experience leads to the conclusion that in a majority of cases there is a disposition to deal fairly with the employees and to give prompt attention to grievances. There are exceptions, as in the case under consideration, and however few and far between these unusual cases may be, they are the ones which create the unrest in the ranks of employees. Pending final decisions the organizations involved will wait and watch, and if finally the court's decision is sustained I do not doubt that action will be taken to regain the liberties the court has trampled upon.

Frank P. Sargent.

## COL. R. G. INGERSOLL ON STRIKES.

No man in the United States is better qualified to give an opinion of the rights of American citizens than Col. R. G. Ingersoll, a lawyer, in the best sense of the term; a thinker, penetrating and profound; a student of everything pertaining to human welfare, besides, a statesman, whose comprehension of constitutional limits is everywhere acknowledged. Any position he may take upon so grave a topic as decisions of courts which strike down unalienable rights, is certain to attract wide attention. In an exchange we find the following which corporations will find it to their interest to make a note of:

Colonel Ingersoll says that "all the courts and legislators in the world cannot prevent men from organizing or striking if they want to." Mr. Ingersoll says the bodies of men concerned are too large to be dealt with legally. "The more these people are oppressed," says Mr. Ingersoll, "the closer they will organize, in spite of all the decisions of all the courts in the world."

In the foregoing Mr. Ingersoll sounds a key note of the coming campaign. If United States judges conclude to play the role of autocrats, then the organization of workmen in America will become more compact, aggressive and defiant, and the problem of federation will be solved. Millions will be unified, as if by a decree of Jehovah. A compact will stand forth as impregnable as Gibraltar. The decisions of courts will be as chaff in the grasp of cyclones, and laws, whether state or interstate, will be swept from the statute books. If the courts deem it wise to fire a Sumter or a Concord gun, it will be heard from the center to the circumference of the nation. Workmen are not slaves, they will not be fettered. The stripes on our flag do not mean that they may be duplicated on the backs of workmen. The first notes of warning are heard, and it will be well if they are heeded.

## RATIFICATION OF THE NEW FEDERATION.

The plan of federation recently adopted at Cedar Rapids, as set forth in the April issue of the MAGAZINE, was formally ratified at a meeting held at the same place, April 6th. The plan as finally adopted, including the articles of federation, are embodied in a circular issued from Cedar Rapids April 6th, which we reproduce in full, as follows:

CEDAR RAPIDS, IOWA, April 6th, 1893.

*To all Divisions or Lodges of the Order of Railway Conductors, Brotherhood of Locomotive Firemen, Brotherhood of Railroad Trainmen, Switchmen's Mutual Aid Association, and Order of Railroad Telegraphers:*

The various boards of officers and committees authorized by the law making bodies in the organizations represented by the undersigned, having duly authorized us to act for them in formally ratifying the following plan of system federation, we, in the exercise of that authority, do hereby formally ratify the same and place it at the option of the members on the different systems of railway to adopt.

It will be within the province of the members of the divisions or lodges to instruct their representative in the General Committee, Protective Board or Board of Adjustment as to his action in the matter, or the desires of the members may be learned by a vote of the membership on the system, two-thirds majority of the whole to govern.

No federation can be formed hereunder which includes but a part of the membership of any organization on the system in question; all divisions, lodges or members of that organization must be consulted and included.

Take note that before being effective, it requires the approval of the executive of each of the organizations which may be included in the federation formed. A certified statement of the process through which it has been agreed upon must accompany all requests for approval.

### ARTICLES OF FEDERATION.

**SECTION 1.** On any system of railroad, the General Grievance Committees and Boards of Adjustment may federate and co-operate with any of the following organizations: Brotherhood of Locomotive Engineers, Brotherhood of Locomotive Firemen, Brotherhood of Railroad Trainmen, Order of Railroad Telegraphers, Switchmen's Mutual Aid Association, and Order of Railway Conductors, for the purpose of adjusting any grievance that may be presented in accordance with the laws of the organization aggrieved.

**SEC. 2.** In the event of any General Grievance Committee failing to adjust a grievance in accordance with the laws governing their organization, the Secretary of said Committee shall forthwith prepare a full and complete statement thereof, under seal and with the signatures of the Committee attached, and forward the same to the Chairman of the General Grievance Committee of each organization constituting the federation.

**SEC. 3.** The Chairman of any General Grievance Committee receiving notice and statement, as provided in Section 2, from the Chairman and Secretary of any General Grievance Committee, representing any organization participating in the federation, shall forthwith answer such call in person, meeting the others at such time and place as is designated, and when so convened, the several General Chairmen shall constitute the General Federated Committee of that system, and shall proceed to organize by the election of a Chairman and Secretary, who shall serve until their successors are duly elected. After such organization they shall, if they approve the grievance, exert every honorable effort to adjust the same.

**SEC. 4.** In the event of the General Federated Committee failing to adjust any grievance that may be referred to it, the Chairman of the Committee having the grievance shall forthwith notify the

chief executive officer of the organization presenting the grievance, who shall at once repair to the place of meeting, and if, in his judgment, the grievance is of sufficient importance, and under the laws of his organization, he is prepared to approve a strike, he shall immediately convene the chief executives of all organizations represented in the federation, and in the event of it becoming necessary to inaugurate a strike, the same shall be authorized only by a two-thirds vote of the Federated Committee and the unanimous consent of the chief executives of all the organizations represented.

**SEC. 5.** Should a strike be inaugurated, the chief executive of the organization aggrieved shall be the recognized leader, and shall have power to declare the strike off with the consent of the General Federated Committee, together with the unanimous approval of the chief executives of the organizations embraced in the federation as provided in Section 4.

**SEC. 6.** The expenses incurred in the settlement of any grievance (or in case of strike) shall be paid by each organization in accordance with the provisions of their respective constitutions and by-laws.

**SEC. 7.** A copy of these articles duly signed by the authorized representatives of each of the organizations represented in the federation on any system, shall be forwarded to the chief executive of each organization, and receive his approval before becoming effective, and no member of this organization shall engage in, or be party to, any federation or alliance except as herein provided.

**SEC. 8.** Any organization that is a part of this federation failing to comply with the rules and regulations contained herein, shall not receive any support or recognition from any organization embraced in this federation on the system upon which the violation occurs, but no organization will be deprived of the benefits of this federation by reason of the acts of its representatives, or its individual members, until such time as they have approved of the action by failure to discipline the parties at fault, and then, only after proper trial and conviction by a two-thirds vote of the Federated Board, subject to an appeal to the executives of the organizations, parties hereto.

**SEC. 9.** If a federation is formed on any system which does not include all the organizations herein named, the others shall be eligible to membership and may file application for such membership with the Secretary of the Federated Board. Upon the receipt of such application, he will forward the same to the Chairman of each General Committee, party to the federation, who will in turn submit it to his associates. Upon receipt of the vote of his associates, he shall file with the Secretary of the Federated Board the vote of his organization in accordance therewith, and the organization applying for membership shall be admitted, if a majority of the organizations, party to the federation, vote in favor of such admission.

**SEC. 10.** These articles may be revised, altered or amended by unanimous consent of the executives of the organizations, parties hereto. We confidently assert that if the members of these organizations will dwell together in peace and harmony, such as exists between your officers, no one can estimate the amount of good which will accrue as a result of such condition. Demanding what is right for yourselves, be willing to accord to others that which is right.

F. P. SARGENT,  
Grand Master B. of L. F.  
E. E. CLARK,  
Grand Chief Conductor O. of R. C.  
S. E. WILKINSON,  
Grand Master B. of R. T.  
D. G. RAMSEY,  
Grand Chief Telegrapher O. of R. T.  
J. E. WILSON,  
Grand Master S. M. A. A.

The new plan should be given a fair and thorough trial, and if it answers the purpose for which it is designed, there will be cause for universal rejoicing.

## OUR CONTEMPORARIES.

The *Switchmen's Journal* for April says:

With this issue the *Journal* closes Vol. VII and passes a mile-post of its history. The journey of the past year has been truly remarkable. Two editors have assumed charge of the *Journal*. One of them was cut down in the prime of life while engaged in an attempt to advance the interests of organized labor, and is now resting in that eternal sleep which awaits us all. While he was in charge of the editorial management of the *Journal* his pen was wielded loyally in the defense of labor. It is with feelings of profound regret that we briefly refer to him at this time. He got out the first number and several succeeding issues of this volume, and no doubt had hoped to live to close the last number.

The *MAGAZINE* has vivid and pleasant recollections of the editor of the *Journal* who fell at his post in the prime of a noble manhood, but it so happens that when a worker falls by the way another steps into his place and the work goes bravely on, as is shown in the *Journal* with Frank Sweeney in the editorial chair.

The *Railway Conductor* for April devotes considerable space to the decisions of Messrs. Taft and Ricks in the Toledo imbroglio. This is right. The people are anxious to know if the interstate commerce law, or any other law creates 3x4 czars with autocratic power to make workmen a part of the rolling stock of corporations. If so, then workmen will promptly knock such laws into spectacular cocked hats.

The *Railway Telegrapher* for May is on our table, and in commenting upon the decisions relating to the Toledo strike says:

We do not believe that under our constitution any act can be legal which forbids an employee the right to sever his connection with his employer at any moment he may see fit, so that he does not criminally endanger life and property, unless it can be shown that the employer is just as rigidly bound by the same act. What we complain of in these interpretations of law is their one-sidedness, in binding the laboring man to do thus and so under certain specified conditions, and at the same time leaving corporation managers to do as they please under the same conditions. Whether Judge Ricks' decision is good law or not we leave the supreme court to decide, but as we now view it, we certainly cannot believe it to be just. We have little sympathy, however, with the idea promulgated by a good many, that all decisions which seem to be inimical to the interests of the poor man, are procured by dishonest means. There are undoubtedly some judges, as there are men in all walks of life, who can be bought with money, but for the most part we believe our courts are presided over by men who have the best interest of all at heart, who are actuated by right motives, and who are controlled by principles of honor and justice, in deciding cases brought before them, and while at times some of them may be more or less influenced—unconsciously—by the subtle influence of capital already mentioned, still we believe, on the whole, that our interests are safe in their hands and as to the supreme court—that tribunal before whom all these matters must come for final adjudication—we have only to say that we believe it to be composed of men who are above reproach. In view of these things we see no reason for desponding.

One of the good results of the Toledo decision is, that it arouses the labor press of

the country as nothing else has done since a labor press existed.

The *Railway Age* quotes Senator Cullom, of Illinois, on railroad rapacity as follows:

The greed for money and the determination to secure it impel men operating railroads and those dealing with them to seek an advantage over others in competition with them, to the extent even of violating the plain letter of the law.

The utter disregard by the common carriers of the country (I speak especially of the railroads) of the common rules of fair dealing with those engaged in shipping, or with localities, prior to the passage of the interstate commerce act.

The people are not willing to permit any legislation that will give greater power to the railroads than they now possess. On the contrary the people demand of congress and of state legislatures legislation that will protect them from the greed and rapacity of monopolies, trusts and combinations.

When great corporations seek to place men in legislatures or other official positions to represent any special interest instead of the interests of the whole people, danger to free government becomes imminent and the people should sound the alarm.

It is very generally conceded that Senator Cullom is level headed and knows what he is talking about, but the *Railway Age* as usual comes into court with a rejoinder as follows:

When railway properties are watched and fettered as they are to-day by national and state laws under which their incomes have been forcibly reduced and many companies are seeing bankruptcy staring them in the face there seems little need of encouraging prejudice or exciting popular alarm anew. The real danger is from a loss of public sense of justice toward capital in every form.

The comments of the *Railway Age* remind us of the story, that on one occasion several of the Rothschilds discussed the poverty of the Astors and the Vanderbilts, expressing wonder how they managed to obtain three square meals a day, to say nothing of the absence of wine. The concern of the *Railway Age* for capitalists is really beautiful—its tears sparkle in its eyes like diamonds. May the Lord give it courage to bear its sorrow.

Again the *Railway Age* refers to the decision of Judge Ricks, as follows:

The validity of the ruling of Judge Ricks in the Toledo strike cases is expected to be brought to test this week before the United States supreme court, in proceedings by habeas corpus to secure the release of Engineer Lennon, who was fined for contempt of court in abandoning his engine on the road and, on refusing to pay, was committed to jail. It seems to be the opinion of the majority of lawyers that the decision was strictly in conformity with the law and that the supreme court will sustain it, in which case the representatives of the labor organizations will endeavor to induce congress to change the law. It is difficult to see on what ground an appeal to congress of this kind could be based. Would the desired amendment be headed "An act to facilitate strikes by authorizing railway employees to abandon their trains when they can most effectively interrupt railway traffic?" Or would it read "An act to prohibit courts of justice from protecting common carriers in conducting state and interstate commerce?" Or would it simply be entitled "An act to encourage conspiracies and boycotts?"

One would think that the *Railway Age* is sufficiently crude to answer questions, especially, such as it asks. Such is not the

case, however. It asks questions which it wants others to answer. Regarding an "appeal to congress" it is sufficient to say, if the law as it now stands enables a judge to reduce workmen to slaves, that law will be repealed by the fiat of workmen, as certainly as that a Kansas cyclone upsets an ordinary hay stack.

The *Cleveland Citizen* discusses the "World's Heroes" and says:

How grand it is for a man to live for a heroic purpose; to give his best thoughts, his time and his ambition to an unselfish work for others—to feel in the good of others the highest personal gratification! Heroic lives that never reach the historian's pen have lived, struggled, suffered and died to bring the world nearer to the good time coming that lives in every brain and lightens every task; proscribed, scorned, and jeered by those they have tried to save, but who lay their tired limbs down, with a smile on their faces, and meet death tranquilly, conscious that the work they had begun will be taken up by others and go on and on; and who die with their faith in man unbroken and pure!

We commend the foregoing, but desire to say, that the time has come at last when heroes propose to have some of the good things in this world besides "scorns and jeers" and die with "their faith in man unbroken." They are going to have at least better food, and more of it, better houses, better clothes—in a word more of the things they are fighting for.

The *New York People* refers to the late strike in Belgium, as "a strike that was a strike." It says:

The whole working class of Belgium went on a strike last week. Mines, factories, shops, wharves were left idle. Civil war was on the point of breaking out. The struggle was short: from it the laborer emerged, his brow wreathed in laurels and with the acquisition of abiding benefits, that will inevitably lead him on to speedy and complete emancipation.

And yet there are those in the United States who declaim against strikes, and among them so-called labor leaders. The Belgium workmen struck for the ballot, and obtained it in spite of king and nobles and the whole aristocratic class.

The *Topeka Advocate* contributes some statistical information regarding "evidences of prosperity" in Kansas. It says:

About a week ago we happened to observe in a county paper a large number of notices of sheriff sales, and it occurred to us to keep a record of such as should appear in our Kansas exchanges for one week. We have not had time to examine all of these exchanges, but in such as have fallen under our eyes during the week we have counted 267 homes advertised for sale under the sheriff's hammer. These are in thirty-seven counties. There are 106 counties in the state. If the same ratio holds good in the other counties there would be considerably over 700 homes advertised at sheriff's sale in the state in the week just closed. At this rate, how long will it take to sell out the state?

Well, if 700 homes are sold at sheriff sale in one week, 36,400 homes would be sold in one year, and as there are about 285,000 homes

in Kansas the sheriff would get away with them all in about eight years.

The *Railway News-Reporter* of April 15, speaks out boldly in regard to the Toledo judicial outrage. It says:

Among the railway organizations there seems to be a feeling that there is serious trouble brewing for all concerned, and it is not at all unlikely that the recent decisions of the two judges in the Ann Arbor cases will hasten the end. Those decisions, in our opinion, will cause a consolidation of all railway labor, and in future strikes, in order to prevent employes from becoming amenable to this law, every employe will have to resign at once. Of course this step would paralyze the industries of the whole country but would result in a speedy settlement of the questions at issue. It would, we admit, be a gross injustice toward the corporations against which there were no grievances, but when such a step becomes necessary to offset the influence of courts which are purchasable, then it will be surely taken.

We have always opposed the boycott because we have opposed the black list. One is as bad as the other, and are weapons that should not be used by either side. There is only one way by which such petty roads managed by even smaller men, can be brought to time when the cause is just, and that is to stop every wheel in the vicinity of that road and leave the rest to the owners of the larger lines. Everybody will exclaim: "But this would work an injustice on lines not responsible for the trouble." True, but no more so than the decisions of a purchased court.

The foregoing is not only concise but embodies facts and common sense, and outlines coming events.

According to the *Vanguard* the editorial rush for passes to get into Jackson Park, is something in the nature of a cloud burst. The *Vanguard* says:

Many of the country editors have added marginal notes or attached letters to their applications explanatory or otherwise. One "molder of opinion," who presides over a weekly newspaper in a town in southern Kansas, and whose journal, according to the newspaper directories, has a circulation of less than 500, fills out the space left blank for the names of those who will represent his paper at the fair as follows:

	Months.
Martin J. Pulkhart . . . . .	May, June, July
Mrs. M. J. Pulkhart . . . . .	May, June, July
Miss Mamie L. Pulkhart . . . . .	May, June, July
Master Eddie G. Pulkhart . . . . .	May, June, July
Jobson Beesa, foreman composing room	August
William Jackson, pressman . . . . .	September

To the application was pinned a note in which Editor Pulkhart assured Mr. Holland that "if he needed any more passes he would let him know."

All of the back township editors are keeping step to the Pulkhart polka, and the jam is likely to be immense.

The *Railway Shop Employees' Journal* for May comes to our table as bright as a "souvenir coin." In discussing "rival methods" to accomplish the welfare of labor, the *Journal* says:

A century since trade was at war with trade; journeymen of one trade delighted to antagonize those of another. Each held itself aloof and rejoiced in its exclusiveness. To-day increased liberty in the body politic has led as it ever does, to an increased social feeling, to solidarity through

federation: while holding to charity for all, it also proclaims in essentials, unity. Each union preserves its autonomy; the old doctrine of "State Rights" here finds its exemplification. When all unions united in support of the Brotherhood of Carpenters and Joiners in their efforts for fewer hours, the federation spirit was seen in its brightest phase.

Manifestly labor is moving in the right direction toward the goal of emancipation.

#### LABOR LEGISLATION IN COLORADO.

Fortunately for the cause of labor, Brother W. F. Hynes, of Denver, was elected a member of the Colorado legislature, recently adjourned. During the session he introduced the following important bills, viz.:

The anti-child labor bill; this bill, it appears, was promptly rejected. An anti-Pinkerton bill passed both houses and was then stolen. A kindergarten school bill was passed and became a law. An eight hour bill passed, but suffered by amendments. A bill licensing stationary engineers did not go through. A bill licensing plumbers passed both houses. A bill making it unlawful to discharge a man because he belonged to a labor organization passed and was then stolen. Bro. Hynes also introduced the employers' liability bill, which passed and became the law of the state, and below is given the full text of this important measure:

Be it enacted by the General Assembly of the State of Colorado:

SECTION 1. Where, after the passage of this act, personal injury is caused to an employee who is himself in the exercise of due care and diligence at the time;

(1) By reason of any defect in the condition of the ways, works or machinery connected with or used in the business of the employer, which arose from or had not been discovered or remedied owing to the negligence of the employer, or of any person in the service of the employer, and intrusted by him with the duty of seeing that the ways, works and machinery were in proper condition; or

(2) By reason of the negligence of any person in the service of the employer, entrusted with exercising superintendence, whose sole or principal duty is that of superintendence.

(3) By reason of the negligence of any person in the service of the employer who has charge of any switch signal, locomotive engine or train upon a railroad, the employee, or in case the injury results in death, the parties entitled by law to sue and recover for such damages shall have the same right of compensation and remedy against the employer as if the employee had not been an employee of or in the service of the employer engaged in his or its works.

#### AMOUNT OF COMPENSATION.

SEC. 2. The amount of compensation recoverable under this act, in case of a personal injury, resulting solely from the negligence of a co-employee, shall not exceed the sum of \$5,000. No action for the recovery of compensation for injury or death under this act shall be maintained unless written notice of the time, place and cause of the injury is given to the employer within sixty days and the action is commenced within two years from the occurrence of the accident causing the injury or death. But no notice given under the provision of this section shall be deemed invalid or insufficient solely by reason of any inaccuracy in stating the time, place or cause of the injury; provided it is shown that there was no intention to mislead and that the party entitled to notice was not in fact misled thereby.

#### WITH CONTRACTORS.

SEC. 3. Whenever an employee enters into a contract, either written or verbal, with an independent contractor, to do part of such employer's work, or whenever such a contractor enters into a contract with a sub-contractor to do all or a part of the work comprised in such contract or contracts with the employer, such contract or sub-contract shall not bar the liability of the employer for injuries to the employees of such contractor or sub-contractor by reason of any defect in the condition of the ways, works, machinery or plant, if they are the property of the employer or furnished by him, and if such defect arose or had not been discovered or remedied through the negligence of the employer or of some person entrusted by him with the duty of seeing that they were in proper sanitary condition.

#### KNOWLEDGE OF DEFECTS.

SEC. 4. An employee or those entitled by law to sue and recover under the provision of this act, shall not be entitled under this act to any right of compensation or remedy against his employer in any case where such employee knew of the defect or negligence which caused the injury and failed within reasonable time to give or cause to be given information thereof to the employer or to some person superior to himself in the service of his employer who had entrusted to him some general superintendence.

#### CO-EMPLOYEES MADE LIABLE.

SEC. 5. If the injury sustained by the employee is clearly the result of the negligence, carelessness or misconduct of a co-employee, the co-employee shall be equally liable under the provisions of this act, with the employer, and may be made a party defendant, in all actions brought to recover damages for such injury. Upon the trial of such action the court may submit to and require the jury to find a special verdict upon the question as to whether the employer or his vice principal was or was not guilty of negligence proximately causing the injury complained of; or whether such injury resulted solely from the negligence of the co-employee, and in case the jury by their special verdict find that the injury was solely the result of the negligence of the employer or vice principal, then and in that case the jury shall assess the full amount of plaintiff's damages against the employer and the suit shall be dismissed as against the employee; but in case the jury by their special verdict find that the injury resulted solely from the negligence of the co-employee, the jury may assess damages both against the employer and employee.

The fact that two important bills introduced by Bro. Hynes were stolen by some miscreants, indicates the infamous methods employed by corporations to defeat righteous legislation. But Bro. Hynes is to be congratulated upon the splendid record he made, and when again he becomes a law maker, it may be set down as a certainty that measures he puts through will not be stolen.

#### SPECIAL.

Changes of addresses and all other business matters relating to the MAGAZINE should be addressed to F. W. Arnold, Manager, Terre Haute, Ind. Much of this correspondence is now directed to the Editor, causing delay and unnecessary work.

#### NOTICE TO MAGAZINE AGENTS.

Please take notice that all changes of addresses should be reported to the manager of the MAGAZINE and not to the editor. All matters relating to subscriptions, addresses, accounts, etc., must be addressed to the undersigned.

F. W. ARNOLD, Manager.

## WM. D. ROBINSON MONUMENT FUND.

Wm. D. Robinson, who died at Washington, Ind., on November 7th, 1890, was the founder of the Brotherhood of Locomotive Engineers, and in doing this great work, he as certainly laid the foundation of the Brotherhood of Locomotive Firemen and all other organizations of railway employees.

In closing our obituary notice in the December, 1890, issue of the MAGAZINE, we said:

In this hour, when Locomotive Engineers and Firemen stand uncovered at the tomb of Wm. D. Robinson, the question arises, What can be done to perpetuate the name, the fame, the memory of a man who gave the best years of his life for their benefit? Is not the answer, We will build him a monument worthy of his deeds, of his labors and sacrifices? We will believe that such is the response.

If it is, let the good work begin, and let it be carried forward until a granite or a marble shaft shall mark the spot where his dust reposes.

"What hallows ground  
where heroes sleep?  
'Tis not the sculptured  
piles you heap!  
In dews that heavens far  
distant weep  
Their turf may bloom.  
Or genii twine beneath  
the deep  
Their coral tomb.

"What's hallow'd ground?  
'Tis what gives birth  
To sacred thoughts in  
souls of worth!  
Peace! Independence!  
Truth go forth  
Earth's compass round  
And your high priesthood  
shall make earth  
All hallowed ground."

The poet's idea is correct. Where Wm. D. Robinson sleeps his last sleep is hallowed ground, and monumental marble could add nothing to its sacredness. But it is all of that without reference to the living. What can the living do to bear testimony that the last resting place of Wm. D. Robinson is hallowed ground?

We do not believe the name of Wm. D. Robinson is soon to perish and be forgotten. We believe the brotherhood he founded will be his imperishable monument, and that his name in connection with that great order is to increase in lustre as the years flow on. But that does not cancel the debt of gratitude the two great brotherhoods of the locomotive owe his memory, which if not met, will, in the judgment of mankind, cover the living with obloquy.

We believe the Brotherhood of Locomotive Firemen will respond in a way that will bear eloquent testimony of their appreciation of the life work of the man that made their organization fruitful above measure of blessings to locomotive firemen. Alone and unaided, our order, for the small sum of 25 cents each, could do the work. But we prefer doing it in conjunction with the Brotherhood of Engineers; nor would we confine subscriptions to the two orders, but would invite all the brotherhoods engaged in the train service of railroads to join in the great work of gratitude.

In discussing the propriety of erecting a monument to perpetuate the memory of the

dead philanthropist, we said in the April issue of 1891:

The idea of building a monument to perpetuate the name and fame of Wm. D. Robinson, originated with the FIREMEN'S MAGAZINE. The time has come for action. Contributions should be made. We have said that 25 cents each from members of the B. of L. F. would build the monument. But we surmise that other orders would want a place in the splendid work proposed, and we have opened in the Grand Lodge office of the B. of L. F.,

## A ROBINSON MONUMENT FUND.

Every contribution, however small or large, will be acknowledged in the columns of the MAGAZINE under an appropriate head, and when the contributions approximate a sum which gives assurance of success to the enterprise, a commission made up of the members of the various brotherhoods will be constituted to take charge of the fund and prepare for work.

Members of the various orders subscribing should designate their calling, and if they will give their address, it will be regarded as a favor.

Now, let the good work proceed. Wm. D. Robinson, when alive, was the friend of the workman. He wrote and spoke and toiled to establish a brotherhood and to teach men the power of organized labor. Railroad trainmen had no more ardent and unselfish friend. Let a monument bear testimony that death did not sever the tie that bound him to the living.

If ever a man deserved the grateful homage of his fellows that man was Wm. D. Robinson. He devoted the best years of his life to the great work of organizing railroad men for their moral and material advancement. He toiled without recompense, he endured privations and made sacrifices, the half of which will never be told. He lived and died

WM. D. ROBINSON.

in poverty, that others might fare better than was his lot. Every man, woman and child who has been, is now, or ever will be the beneficiary of any of the brotherhoods of railway employes, owes Wm. D. Robinson a debt of gratitude that can never be paid. Such a man deserves a monument to bear testimony of the love and gratitude of those for whom he accepted poverty, persecution and all their attendant ills, and every member of every organization of railroad employes should cheerfully contribute his mite, small as it may be, to such a noble purpose. Contributions may be directed to the LOCOMOTIVE FIREMEN'S MAGAZINE, Terre Haute, Indiana, all of which will be acknowledged in its columns.

## COMPLIMENTARY TO MR. MOSELEY.

The following resolutions of thanks to Mr. Moseley were unanimously adopted by the Commonwealth of Massachusetts:

*Resolved*, That the senate and house of representatives in general court assembled, appreciating the valuable services rendered the cause of humanity by Edward A. Moseley, of Newburyport, by his untiring and efficient efforts to secure greater safety to railroad employes, hereby tender the thanks of the commonwealth to him for his sincere and disinterested labors to secure the passage of the law requiring railroads engaged in interstate commerce to equip their freight cars with automatic couplers.

*Resolved*, That a copy of these resolutions, suitably engrossed, and signed by the president and clerk of the senate, and the speaker and clerk of the house of representatives, be forwarded to Mr. Moseley.

Mr. Moseley may well feel proud of such a testimonial. Few men are honored so greatly, and fewer still deserving of the tribute.

## O. R. C. CONVENTION.

The annual convention of the Order of Railway Conductors met at Toledo, Tuesday, May 9th. We clip the following account of the opening exercises from the press dispatches:

The Order of Railway Conductors opened its national convention here this morning with public exercises at the People's Theater. Governor McKinley welcomed the visitors in behalf of the state. Grand Master F. P. Sargent, of the Brotherhood of Locomotive Firemen, was present and spoke as follows: "It was nearly two years ago that I first met your officers. Since then I have traveled side by side with them. I came here today to pay you tribute in behalf of the Brotherhood of Firemen, whose members are your constant companions, and who are looking towards Toledo to-day. They hope this convention will be one of the most successful in the history of the order, and that you may go home laden with good ideas and the determination to carry them out. The O. R. C. will not alone be benefited by your deliberations, but every organization will learn from you, and will go forth to greater conquests than they have yet achieved.

"My predecessor, Mr. Brown, has brought home to me several questions which I must have time to consider. Each one of this audience must consider them. But, sir, you have spoken them to a body of men who are capable of grasping the ideas. In Toledo things have been brought up during the past two months which should have awakened the thoughts of every one. Right here we have seen men ask to better their condition. They were men who were firing locomotives for \$1.20 per 100 miles a day. [Hisses.] They have gone in a gentlemanly manner and asked for a few cents more a day. They have gone so far as to ask that their fellow citizens be called in to arbitrate. Finally, when the head of the great corporations involved said he thought this to be an honorable way, and the men were called, the firemen were given a raise in wages. The corporation then repudiated the settlement with their men, when they could no longer work they quietly withdrew from the service. This was an honorable transaction and will stand to their credit. Yet by contemplated action of their fellow workmen we were obliged to bow in humble obedience to the law, which, as honorable men we did. We were told that we must quit our position at certain times and places. We obey the laws. We believe in obeying the mandates of the jurists who are elected to preside over us. But we must analyze the laws and see if there is not something in them that will protect our interests

also. If the common carrier must carry on its work, let it be seen to that those who work for them get justice. Let the experiences of the last three months teach us the lesson. Let us think. Let us require the gentlemen to whom we have given our franchise to enact laws in which we will be given a hearing. Then we will bow in humble obedience to the laws, go ahead and do our duty and protect this noble country.

"Brethren in legislative session, let us pass in review the record of the past two years; pass laws which will do you honor and credit." In closing Mr. Sargent paid tribute to Chief Conductor Clark. He said: "It makes me proud to pay tribute to the noble man who presides over the O. R. C. On many occasions we have been together in council. I have found him honest, noble and truthful. I am proud to call him brother. There is not a fireman in our brotherhood but tells the same and when your work is ended may peace and prosperity enter your life. May the O. R. C. stand out as a bright star in the constellation of organized labor."

## A CHARMING BOOK.

We are indebted to the publishers, Messrs. Mast, Crowell & Kirkpatrick, Springfield, Ohio, for a copy of the magnificent book entitled "Scenes from Every Land," a collection of over 500 fine photographic views, size 11½ by 14½ inches, designed to take the place of an extended tour of the globe, and embracing the most beautiful, interesting and striking scenes that divert the traveler abroad, the whole forming a photographic panorama of the world. With an introduction by Gen. Lew. Wallace, and descriptions of the different scenes by Edward Everett Hale, D. D.; Washington Gladden, D. D.; Russell Conwell, D. D.; Hamilton W. Mabie, LL. B., Lit. D.; S. F. Scovel, D.D., LL.D.; C. H. Payne, D. D., LL. D.; Hon. Wm. C. P. Breckinridge, Hon. Henry Watterson, J. H. W. Stuckenburgh, D. D., of Berlin, Germany, and other talented writers; edited by Thomas Lowell Knox. Springfield, Ohio: Mast, Crowell & Kirkpatrick.

The book, in all of its parts, binding, paper and typography, is one of rare beauty and perfection, and the splendid collection of engravings, from photographs, cannot be excelled. As all the illustrations are made from actual photographs, they possess the charm of accuracy; a photograph tells no lies. The descriptions are charmingly written and contain a surprising amount of information. The system of indexing used renders the information relative to any city, country, building or scene readily accessible, thus making it a valuable work of reference. It contains many fine photographs of famous paintings and statuary in the art galleries of London, Paris, Florence, Rome, Dresden and other great cities. The publishers have cause for congratulation in the fact that considerable space is devoted to American scenery, there being too much of a tendency on the part of publishers generally to illustrate other lands to the neglect of our own. The writers we have named are a guarantee that for elegance of expression their articles will

be read with special delight. We most heartily commend "Scenes from Every Land" to the readers of the MAGAZINE, feeling confident that after careful perusal they will find themselves in possession of information that falls to the lot of only the favored few by extensive travel.

### SCHEDULE MAKING.

MR. EDITOR:—In the earlier days of rail-roading, it was the practice of railroad companies to formulate a schedule of wages to be paid the employes, in certain branches of the service. In recent years, however, it has come to be the practice to have representatives of the employes, in the particular line of service to which the schedule applies, present to assist in arranging its details. This being the case, it is the apparent duty of every employe affected, to make this a matter of careful thought and study; and I am of the opinion that a more general study of the subject, and a liberal exchange of views, through the various railway journals, would be of great benefit. As it now stands, we are often brought face to face with men whose only study of the matter has been to pick a schedule to pieces; without ever a thought of putting one together. It has been remarked that it is impossible to construct a schedule which will fit all cases. For one, I am inclined to believe that a schedule can be produced which will cover every point existing at the time of its adoption; I am further convinced that provision might be made whereby unforeseen changes and conditions could be disposed of. But, to produce a schedule which will stand the torture to which an article or clause is sometimes subjected by railway officials, in order to make it operate in favor of the company, is quite a different matter. Take, for example, this; "When road engineers are required to switch over one hour at terminal stations, where switch engines are regularly employed, they will receive compensation for such service at road rates." Presently a case comes up like this: Business drops off, and the day switching service at a given point is discontinued; road crews arriving during the day-time are required to switch their trains, and out going crews are required to make up their trains; the division superintendent refuses to allow time for this switching on the grounds that there is no switch engine regularly employed. At the same time a switch engine works nights, every day in the week. Well, the boys carry the case up to the highest authority, and he decides that "as there is no switch engine regularly employed in the day time the schedule does not apply and no time can be allowed." It is indeed a hopeless task to make up a schedule which will stand such inroads upon its good intentions. I presume

that fully as wide a divergence from the meaning and letter of a schedule, as the foregoing, might be cited on the part of the employes; but what I wish to emphasize is the importance of so wording and framing the instrument as to leave as little room as possible for this sort of business; also, for providing a court of final arbitration whenever either side persists in so grossly twisting and misconstruing a schedule. In making up a schedule there are certain primary principles that should be clearly stated as a basis on which to build. The rate of pay per day, hour, mile, or run, should be definitely stated; how fractions of these units of reckoning should be disposed of; where and when one run or day ends and another begins; such terms as division terminal, or division station, should be clearly defined as to their application to the schedule. But what has caused the destruction of the most schedules has been the fact of their final interpretation by one only of the two parties to their formation. So long as a decision from an officer of the road is sufficient to nullify the operation of any provision of a schedule there is little use in spending time over their construction. The instrument itself should designate who is to make the final decision, whenever parties to the agreement differ as to its meaning or application.

A. H. Tucker.

CHILLICOTHE, Mo.

### EVOLUTION AND INDEPENDENCE.

MR. EDITOR:—The January MAGAZINE contains an editorial article on the subject of evolution in which the employes of the Reading railroad are denounced in effect as being natural, volunteer, cowardly slaves; as "Men who willingly yield up their independence, and like so many peons or helots wear the badge of servitude placed upon them by McLeod." "Men who dare not light a lodge fire and proclaim their emancipation from their slavish condition." "For such men neither evolution nor revolution could lift them in a thousand centuries one inch above the dead line of their degradation." These expressions indicate a belief on the part of their maker that those men are wholly devoid of all those qualities and sentiments that go to make self-respecting men; that they are strangers to the love of liberty, and are so indifferent to their slavish condition that they would not change it if they could; that they are incapable of feeling humiliation, disgrace or insult at the various indignities put upon them by their masters in compelling them to shave off their beards and submitting to other tyrannical abuses; and further, that they themselves are to blame for their deplorable state. Nothing can be more erroneous than such a

belief, and one is very much surprised to hear an expression of it coming from the editor of the MAGAZINE. The unbiased minded student of causes and effects who views the entire field without prejudice knows that the MAGAZINE is wrong when it declares that the men of the Reading railroad wear "the badge of servitude put upon them by McLeod." He knows that that badge of servitude is not put on them by McLeod or any other individual or particular corporation, but by unjust social and economic systems out of which have naturally grown institutions that make the masses the political and industrial slaves of the few; systems that were born of brute force, reared in superstition and maintained by ignorance, prejudice and bigotry, and that the slavish condition of the men of the Reading, or any other railroad or corporation, is owing to the existence of these systems and to no other cause, and that they are as powerless by themselves to change their conditions while such systems supported by the present condition of the public mind—ambition and greed on the one side and ignorance, prejudice and stupidity on the other—exist as were the slaves of the south to gain their freedom by their own efforts, while the institution of slavery itself was looked upon by the masses as being right. The men on the Reading, and all the rest of us slaves, have exactly the same forces to contend against as did the slave of the cotton field. While private ownership in land is recognized by the masses as being right, all those who cannot in the nature of things own land must, of necessity, be the slaves of those who do own it, and until such ownership is abolished through the medium of a single tax on land values, we can no more hope to become free from our slavish condition than could the man sold on the block hope to walk out of the market place a free man while the laws of the nation, enacted by groveling ignorance on one side and haughty aristocracy on the other, declared in letter and in spirit that private property in man by man was right. Would not evolution or revolution lift the owner of the soul who sung—

At night, when all was dark,  
I listened to the watch dog's bark,  
And it seemed to say to me,  
You people must be free

From these agonizing, cruel slavery days—in a thousand centuries one inch above the dead line of his degradation? His condition to-day answers yes, for it has. But could he, or any number of those in bondage with him, have dared "to light lodge fires and proclaimed their emancipation" while the pulpit declared slavery to be a divine institution, and the Supreme Court of the land held that a black man had no rights which a white man was bound to respect, and the overwhelming majority of the people of the nation were fools enough to believe it and

give it their support. No one dare say that he could. Neither can the men of the Reading, for the same forces operate to-day to hold them down that held down the chattels of ante-bellum days. It is therefore as senseless and useless to rail at the Reading men, as the MAGAZINE does in this instance, as it would have been for the Garrisons, Holmeses and Phillipses to have railed in a like manner at the negroes of the south. The former, like the latter, are the fruits and victims of institutions. They (we all) are the effects not the causes, except in so far as we persist in remaining ignorant of our inalienable rights, and for that reason vote ourselves slaves instead of free men. The war between organized monopoly and organized labor is being waged, and it does not require a very acute mind to see what the result must be under the circumstances. The outworks of labor are carried by the enemy in the quenching of the lodge fires of the Reading employees. They have won another victory in Judge Ricks' decision, which, if supported, will end the war in a short time, for no lodge fire can long remain burning in face of it, and the Napoleon of labor will meet his Waterloo at the hands of the Wellington of monopoly. The only escape from this is through free land—the single tax.

"See you poor o'er labored wight,  
So abject, mean and vile,  
Who begs a brother of the earth  
To give him leave to toil.  
Were I designed yon lordling's slave  
By nature's law designed,  
Why was an independent thought  
Ever planted in my mind?"

So long as "yon poor over-labored wight" is compelled to "beg a brother of the earth to give him leave to toil," so long will there be men who dare not light a lodge fire and proclaim their emancipation from their slavish condition.

P. W. Monahan.

GRAND JUNCTION, COL.

#### IN DEFENSE OF "THE BOYS."

MR. EDITOR:—Mr. W. T. Nicholson, a fireman on our division, in a communication which appeared in the March MAGAZINE, makes some very severe as well as unjust remarks concerning our boys. One who was not acquainted with the boys would think, after reading his article, that they were a set of confirmed drunkards, inveterate gamblers, regular patrons of houses of ill-fame; not permitted to associate with respectable people.

Many of us are married men and, of course, the article in question reflects very strongly on our wives, as well as ourselves. Mr. Nicholson may have found himself, as he says, "Placed outside the pale of the very best society," if such is the case we feel very sorry for him; however, I can truthfully say in justice to the boys, that Mr. Nicholson's case is an exceptional one, as we find no such general condition confronting us.

As to the boys being drunkards, gamblers, etc.; out of more than 150 enginemen employed on this division there is not one drunkard; neither is there one who makes a practice of gambling. As to patronizing houses of ill-fame, Mr. Nicholson may be better authority on that point than I am as I never go to such places.

He says he has been a constant reader of the *MAGAZINE* for the past five years: he might have added, to substantiate his economic principles, that during the entire five years it had not cost him a cent; and, in fact, he had not paid out a cent during that time towards furthering the interests of enginemen: I presume, though, he was too modest; Mr. Nicholson detests egotism.

Mr. Nicholson belongs to a class of men, who, thank the Lord, are very scarce here; a class who insist upon reaping benefits which have been paid for by others; he is one of those goody goody persons who would attend church and contribute a nickle (if he had no penny) and feel that he had done more good than if he had contributed two dollars towards assisting some poor man who had lost a limb. The reason he would feel better over it would be because it had cost him less. He is not what might be called a self-made man, notwithstanding he never helped to make anyone but himself.

The enginemen on this division have often been complimented for their sobriety and general good behavior, consequently, we cannot afford to be brought down so low in the eyes of the public without resenting it in some way. We make our standard of sobriety high and the man who does not come up to it cannot join our brotherhood: we are never afraid, when going before our master mechanic in the interest of some brother, that he will call our attention to the fact that "this man is a drunkard."

Our boys may not assume a sanctimonious look on Sunday morning; nor be regular in attending church, but take a piece of paper and write at the top of it that so and so has fallen from his engine and broken a leg, and that the undersigned agree to pay the sum set opposite their names etc., and, while the boys may not fall over each other in their efforts to subscribe, when you come to them you may feel assured that you will not go away empty handed; and if you see any one who is trying to shun you, you may call him Nicholson and count on being very nearly right.

The boys may get on their ears once in a while and use language which would not be appropriate to the society which our friend is lamenting because he cannot mingle with, but they don't mean it; they are simply wound up and have to run down before they stop.

*George W. Lumm.*

BARNESVILLE, MINN.

### THE ANN ARBOR DECISIONS.

MR. EDITOR:—Having watched with interest the Ann Arbor strike, and the consequent legal decisions arising therefrom, I feel that I must say something in regard to the matter.

According to the decisions of Judges Ricks and Taft, a laboring man has no right to leave the service of his employer when he sees fit to do so, without first consulting his employer.

A pretty state of affairs we are coming to in this much lauded free country! I say that any man has the right to quit work whenever he wishes to without consulting such things—who pass themselves off for men—as Judges Ricks and Taft. These men are nothing more nor less than the tools of corporations. If it is unlawful for an individual, or a body of individuals, to boycott a corporation, according to the inter-state commerce law, then it is unlawful for corporations to boycott one another, as was done in the case of the "Alton" by the other roads refusing to sell tickets over this road.

Again, according to the interstate commerce law, it is unlawful to issue passes to any person not an employe of a railroad; yet this law is violated every day in the year by these very law abiding corporations, by issuing passes to members of the legislature, newspaper men, and others who have no right to such passes according to the law. What is it done for? Simply to influence legislation in favor of the railroad companies who would trample laboring men under their feet as they do the dust, if they could. All praise to the men who dare to organize and prevent in some measure, the degradation of laboring men!

Judge Youngsblood, of the appellate court at Mt. Vernon, Illinois, has put himself on record as saying that Judges Ricks and Taft's decisions were an outrage on decency; that they were against the constitution of the United States, and would not hold good in the supreme court. It seems to me that if the railroads can resort to the courts the brotherhoods can do likewise; it is a poor rule that will not work both ways.

I have been trying to induce a member of the legislature to introduce a bill making it unlawful for railroads, or corporations of any kind, to discriminate against labor organizations. How I shall succeed, I do not know, however, I shall keep pecking away until something is done.

The laboring man of this land, and especially brotherhood men, should look this question square in the face and put forth every effort to have something done in the way of legislation for the masses. This can only be accomplished by nominating men for office from their own ranks and seeing that they are elected, regardless of party.

There is no question, in my mind, that the railroad companies are trying to break up the different organizations. This should only have the effect to bind them more strongly together to obtain their rights as American citizens.

"In unity there is strength," and these corporations know it. Federation! Federation is the word! Sound the slogan all along the line from ocean to ocean, and from Canada to the gulf!

*George M. Renzer.*

SPRINGFIELD, ILL.

#### THE PROBLEM OF UNEMPLOYED FIREMEN.

MR. EDITOR:—Having been obliged to travel over many different railways in search of employment, since the San Antonio and Aransas strike, my attention has been called to the large number of experienced firemen who are idle. The questions naturally arise; who is to blame for this and, why are not these men at work instead of going from place to place in search of employment? Hundreds of good experienced firemen are, to-day, tramping the country seeking employment without success, while inexperienced men are being hired every day. What is to be the result if this condition of affairs continues to exist for the next three years, as it has for the three years past? It will be utterly impossible for a man to obtain a situation without starting at the foot and climbing the ladder again. As it is, unnecessary burdens are placed upon those brothers who are at work, because of supporting those who are idle. Taking a broad gauge view of the matter; all clear minded men must admit that the firemen themselves are to blame for the fact of the country being flooded with idle firemen.

Most roads,—in fact all first-class roads—have a contract, or an agreement, with their employes, and in how many of these agreements do we find any provision for the benefit of our brothers, who are out of employment? These men call for a contract and get it; the question of wages and of rights to regular runs is thoroughly discussed, but the brother, who is traveling all over the country in search of a situation so that he may provide for the wife and child he has left at home, is never thought of. Why not include the question of giving our brothers the preference in the employment of men, in that contract?

Firing is like any other trade, and let us see that those who have served their time shall have the preference. We should make it plain to the officials that it is decidedly in their interest to employ experienced men; this done, I think, we shall be in a fair way for the solution of the problem.

Constant neglect, by the officers of lodges,

of section 160, of our constitution, helps to keep full the ranks of our unemployed. There was one exception to this in my case, at Needles, Cal., they went to Mr. Wm. Hancock and tried hard to get me a situation. Now, I ask the many brothers, what can be done to obtain situations for our idle firemen? I suggest that we insert a clause in our contracts requiring the employment of experienced men. Brothers, let us hear from you.

*Frank Massey.*

YOAKUM, TEXAS.

#### PREACHING VERSUS PRACTICE.

O, father, dear, when I heard you preach  
In your eloquent style to-day,  
Such a sermon grand, full of flowery speech,  
Meant to drive life's ills away;  
I had many doubts, which, I must confess,  
In a sort of public song,  
That our souls will bloom for this life's distress,  
Yet I hope I may be wrong.

When you told of the rich man's chance to win  
His way to eternal bliss,  
That the wealth he has is a woful sin  
It were better for him to miss,  
Sure I shook my head in a dubious vein,  
And I hankered for a slice  
Of the wealth you called "his ill gotten gain,"  
In spite of your sage advice.

When you preached of health on homely food,  
Old Nick must have whispered me  
That you grow quite fat on broiled and stewed,  
Grilled turkey and fricassee;  
And would hate to munch an old frozen crust,  
With some water to wash it down,  
Which we listeners ate, whom you say from dust  
Shall ascend to the victor's crown.

Now, if wealth is wrong, will you kindly say  
Why you keep an open fist.  
To catch each cent which comes your way  
Of "the dirty deadly grist?"  
You're sure to freeze to the dollars tight,  
For you hoard them up secure;  
And, in fear they'd leave the path of right,  
Not a cent do you give the poor.

You wear broadcloth fine, and your linen's white  
As the drifts of unsunned snow,  
Which caused us many a weary night  
But a few short months ago.  
Bull's wool and oakum and shoddy stuff  
You've never been known to wear;  
Although you preach "Those in garments rough  
Eternal joys shall share."

What a glorious time we shall find above  
To repay us for suffering here;  
Up in beggars' row, where all is love,  
If your sermons are sincere!  
Whilst you'll be down amongst the rich and great,  
In the gloom of endless night.  
Arrah, father dear, "will you hould yer prate,"  
Old women are all you fright.

While the demon Doubt in my brain holds sway,  
I must kick like a Texan steer;  
And he reigns supreme in my head to-day,  
Without ever a thought of fear.  
If you'd only practice the things you preach,  
I would follow you with a will;  
But I want more proof than your flowery speech  
To restrain me from doubting still.

*Shandy Maguire.*

## A RAILWAY SURGEON'S OPINION.

MR. EDITOR:—In the course of a paper read before the Association of Surgeons in the city of Savannah, March 7, 1893, Mr. W. H. Philpot, surgeon for the Central Railroad of Georgia, gave utterance to a sentiment which the great army of maimed and injured railway employes throughout the country will read with interest, if not with indignation; here it is:

Employes, I have thought from examination of some who have been injured, have grown careless and indifferent in the discharge of their duties, at least some of them; all perhaps for the sole object of being injured slightly, not terribly or seriously, but just enough to obtain damages or an increase of pay, or maybe a life time job. The road's surgeon on being called should if possible ascertain the circumstances attending the accident. Is he a car coupler and did he perform the duty as per instructions? Having a finger or two injured requiring amputation is somewhat suspicious, like a soldier (not a good one) who presents to the surgeon while the battle rages a powder burnt hand and one finger shot off. Then injuries to the road's employes are to be examined with suspicious carefulness when the wounds upon the hands or feet are not of a very serious nature, for it may be that the injury was intended or provoked.

That's a mighty interesting, sentiment, isn't it? Especially when we consider that it was delivered in the course of a public address, before a body of men whose duty is to alleviate the pangs of suffering, as far as may be, and to heal the injured.

I have always supposed that it was the duty of a railway surgeon to administer treatment to the injured, without in any way troubling himself as to how the injury occurred, but it seems this is all a mistake. "The road's surgeon on being called should if possible ascertain the circumstances attending the accident." In other words the road's surgeon should assume judicial functions instead of remedial ones.

"Is he a car coupler and did he perform the duty as per instructions?" It is hard to understand just why a surgeon's performance of duty should be in any way influenced by the fact of whether an injury is contracted while working "per instructions," or in opposition to instructions. It seems to me that a surgeon's duty ends when he has given all possible attention to the person injured; the well paid corporation attorney may be relied upon to fully protect the company's interests, and you may be sure that he will strain a point or two to show that the injured person was not working "per instructions," if it shall appear necessary to do so. It would indeed be cause for hearty congratulation if it could be shown that even a tithe of the injuries which daily occur, would have been avoided by working "per instructions;" but it is impossible to show any thing of the kind, for the simple reason that the instructions issued with the ostensible object of protecting the employe against injury as far as may be, are never calculated to be carried out in practice, but are issued merely with

the object of protecting the company's interest.

The employe who should attempt to carry out the laudable design of working "per instructions" would soon find himself minus a job; and if the attempt to work "per instructions" should become universal, the efficiency of the roads would become so greatly impaired that a new code of instructions would become a necessity in order to come any where near being able to handle the traffic with the present force of employes. These facts are well understood, both by employes and employers; manifestly they are facts with which the railway surgeon has nothing to do, he is not even expected to pass an opinion, in a court of law, as to whether an injury might have been avoided had the injured party worked "per instructions;" all he is expected to do is to testify as to the nature and extent of the injury, in order that the court may equitably adjudicate the amount of the damages, should damages be allowed.

But the inhumanity of Mr. Philpot, and his supreme contempt for such common people as railway employes, appears in the following sentence, "Having a finger or two injured requiring amputation is somewhat suspicious." The maimed employe who is so fortunate as to escape with but the loss of a finger or two is to be regarded with suspicion, as if he were a criminal attempting to perpetrate a deliberate swindle upon his employers; it would be interesting to know just where this Mr. Philpot would establish the line of demarkation between those who should be regarded with suspicion as swindlers and those who should be treated without suspicion as honest men. Would the loss of one finger or two fingers place a man under the ban of suspicion as a swindler, and the loss of three fingers be regarded without suspicion? Or would it require the loss of four fingers or maybe an entire hand to establish a man's reputation for honesty? Mr. Philpot should clear up this point; for, since the subject has been introduced by this doctor who knows so much, railway employes have a right to know the exact light in which they are to be regarded when they are so unfortunate as to be maimed or injured.

But it is when we come to consider the motives which this learned doctor enumerates as being sufficient to induce railway employes to play the role of swindlers, by means of self-inflicted injuries, that the bitter irony of the whole thing, and the gross ignorance of this knight of the scalpel, becomes apparent.

There is not the slightest evidence to show that railway employes are so uniformly victorious in their attempts to obtain damages for injuries received as to constitute a motive for attempting to perpetrate a swindle of this description. On the contrary, the diffi-

culty of obtaining damages even when the employe has all the weight of evidence in his favor is well understood, and this difficulty is sufficient to deter the great majority from making any attempt to obtain damages, when by every sentiment of justice and humanity, they are clearly entitled to them. That the co-employe iniquity and the "per instructions" plea are amply sufficient to protect the railway companies in their damage suits with their injured employes, the great army of maimed and injured employes who are dragging out the remnant of a miserable existence, burdens to themselves and, in many instances, burdens to the community of which they are members, are but too well aware. The hope of obtaining damages is not a sufficient motive to induce any man of intelligence to inflict injury upon himself.

The "increase of pay" motive may be dismissed with very few words: railway companies, in common with all other employers, pay their employes wages which are calculated to be commensurate with the responsibilities of the position which they fill: the man who cannot fill a position acceptably does not get the pay attached to it, irrespective of whether he has been injured in the service or not. It would be interesting to know just how Mr. Philpot would go to work to prove that an injury to a man fitted him to fill a position of increased responsibility, which he must do in order to show that the motive of "increase of pay" is adequate to produce the results ascribed to it. I venture to say that the number of railway employes who are now obtaining an increase of pay, as the direct result of injuries sustained in the service, is so miserably small as but to accentuate Mr. Philpot's entire ignorance of what he is talking about. As to the lifetime jobs which come to the employes as the result of injuries, I would wish Mr. Philpot condemned to no worse fate than that of being compelled to fill one of them; railway employes well know the dreary monotony, the utter hopelessness which enters the life of the injured employe who is condemned to fill one of those lifetime jobs.

But the grotesque absurdity of Mr. Philpot's insinuations becomes apparent when we consider that they were intended to have a juridical bearing. Is there a surgeon upon the face of the earth who could go into a court of law and declare it as his deliberate judgment that an injury was self-inflicted, without committing perjury? Is there any man who could honestly give such evidence unless he was an actual spectator of the accident, and even then must not the injury be so palpably and deliberately self-inflicted as to remove all doubt in the matter, before such evidence is admissible? That the surgeon who is called to treat an injured employe should be competent to give such evidence, presupposes, in the surgeon, a knowl-

edge of conditions and circumstances which even experts in the business do not possess, and which, in the very nature of things, they cannot possess. The question is one which may not be decided by simply ascertaining whether or not the injured party was working "per instructions." Mr. Philpot should look in some other direction to protect his employers from fraud as, manifestly, in this direction he is far beyond his depth.

*W. P. Borland.*

#### A HOME FOR DISABLED FIREMEN.

MR. EDITOR:—I wish to offer a suggestion to the Brotherhood, through our MAGAZINE, concerning a home for disabled firemen, and I hope my suggestion will receive earnest consideration. According to the report of our third biennial convention, we had a total membership to August, 1892, of 26,223. Now, instead of every member receiving his MAGAZINE free, let him pay \$1 per year for it, the proceeds to go towards building a home for firemen who have become disabled while in discharge of their duty. I do not believe there is a brotherhood fireman in the United States who would object to paying \$1 for the first year towards the erection of a building for such a purpose, and, in all probability, a less sum than \$1 would suffice after the first year. There are many firemen who have good homes to go to; and, should an accident overtake them, they have relatives who would look out for their support. But there are many who have no homes to go to and it is to these that this letter is especially directed. I believe that the B. L. F. could build a magnificent home in some part of the United States, which would be a monument to the city in which it was located, as well as a credit to our noble organization.

Let us say there is a home already established; as firemen are sent there, after becoming disabled, their payments towards keeping up the home would cease; but the firemen who take their places on the road would then be paying for the disabled brothers; and, as the Brotherhood is getting stronger every day, (which means more money for the home), there would never be any deficiency in the yearly amount for its maintenance. Probably, after the first year or two after the home was built, we might be able to reduce the yearly payment from one dollar to seventy-five cents, or even less than that, as our membership increases. We might be able to build a home in some city where the citizens would donate a site, or grant us exemption from taxation for a certain length of time, as the money left in a city from such an institution would more than repay them for all the ground we would need. As I think this question is an important one, I hope to receive the views of many readers of the MAGAZINE upon my suggestion.

*Walter C. Garaghty.*

# GRAND LODGE.

## ASSESSMENT NOTICE FOR JUNE.

OFFICE OF THE GRAND LODGE, B. of L. F.,  
TERRE HAUTE, IND., June 1, 1898. }

ASSESSMENT No. 88, \$2.00.

### To Receivers of Subordinate Lodges:

**SIRS AND BROTHERS:**—You are hereby notified of the death and disability of the following members entitled to all the benefits of the order, viz:

**CLAIM NO. 966.** Joseph H. Witte, of Industrial Lodge No. 21, died from injuries received in Railway Accident, January 19, 1898.

**CLAIM NO. 967.** Herbert Englebert, of D. J. Chase Lodge No. 259 was declared totally disabled by Loss of Foot, January 21, 1898.

**CLAIM NO. 968.** Frederick W. Clark, of Green Mountain Lodge No. 301, was killed in a Wreck, February 27, 1898.

**CLAIM NO. 969.** Jno. F. Condon, of Safety Lodge No. 142, died of Pulmonary Phthisis, March 3, 1898.

**CLAIM NO. 970.** Hezekiah H. Hawk, of Oriole Lodge No. 214, was killed by Explosion of Boiler, March 7, 1898.

**CLAIM NO. 971.** Walter B. Whittemore, of Minneapolis Lodge No. 270, was killed in a Wreck, March 11, 1898.

**CLAIM NO. 972.** J. E. Howard, of Minnehaha Lodge No. 61, was killed in a Railway Accident, March 11, 1898.

**CLAIM NO. 973.** J. W. Gates, of Sacramento Lodge No. 58, died of Pulmonary Consumption, March 14, 1898.

**CLAIM NO. 974.** Marshall Koon, of Eel River Lodge No. 164, was killed by Railway Accident, March 14, 1898.

**CLAIM NO. 975.** David Liddell, of Standard Lodge No. 158, was declared totally disabled by Spinal Meningitis, March 23, 1898.

**CLAIM NO. 976.** Frank Estell, of Monte Sano Lodge No. 279, died of Typhoid Fever, March 31, 1898.

**CLAIM NO. 977.** Michael Moriarity, of Saginaw Valley Lodge No. 286, was declared totally disabled by Anchylosis of Metatarsal Joint, March 31, 1898.

**CLAIM NO. 978.** Edward Gilligan, of Falls City Lodge No. 103, died of Acute Bronchitis, March 31, 1898.

**CLAIM NO. 979.** J. R. Hambley, of Crystal Lodge No. 408, was killed in a Collision, April 3, 1898.

**CLAIM NO. 980.** W. H. B. Blake, of Vigilant Lodge No. 498, was killed by Falling from Engine, April 3, 1898.

**CLAIM NO. 981.** H. E. Woods, of Crystal Lodge No. 408, was killed in a Collision, April 3, 1898.

**CLAIM NO. 982.** Alfred Fredericks, of Red River Lodge No. 8, was killed by Explosion of Boiler, April 3, 1898.

**CLAIM NO. 983.** William C. Gibson, of Provident Lodge No. 220, died of Typhoid Fever, April 5, 1898.

**CLAIM NO. 984.** John Hans, of J. B. Maynard Lodge No. 198, was Scalded to Death, April 5, 1898.

**CLAIM NO. 985.** Albert Burgess, of Justice Lodge No. 357, was declared totally disabled by Loss of Hand, April 7, 1898.

**CLAIM NO. 986.** William McFadden, of Diamond Lodge, No. 417, died of Pleuro Pneumonia, April 13, 1898.

**CLAIM NO. 987.** Ira Gliff, of Evening Star Lodge No. 112, was Run Over and Killed, April 14, 1898.

**CLAIM NO. 988.** Frank D. Rennie, of Metropolitan Lodge, No. 363, died of Pneumonia, April 18, 1898.

**CLAIM NO. 989.** William M. Wright, of Rose City Lodge, No. 45, died of Emphysema, April 19, 1898.

**CLAIM NO. 990.** James Conklin, of J. J. Manning Lodge, No. 472, died of Internal Hemorrhage, April 24, 1898.

**CLAIM NO. 991.** Thomas O. Berringer, of McKeen Lodge, No. 154, was declared totally disabled by Paralysis, May 3, 1898.

An assessment of **TWO DOLLARS (\$2.00)** has been levied for the payment of the above claims, and you are required to forward said amount for *each member* whose name appears on the rolls of membership **MAY 31st, 1898**, (also for all members having taken a withdrawal (limited or final) *after MAY 1st*, and for all members who died or were totally disabled since that date), said remittance to reach the Grand Lodge not later than **JUNE 20th, 1898**, as provided by Section 50 of the Constitution. Any lodge failing to make returns as above provided will stand suspended from all the benefits of the order, as per Section 52 of the Constitution.

Yours fraternally,

F. P. SARGENT, G. M.

F. W. ARNOLD, G. S. AND T.

## REDUCED TO \$1.00.

We have on hand a supply of bound volumes of the MAGAZINE for the year 1891.

The volumes are artistically bound in a way to withstand wear, and we need not say are intrinsically valuable, containing as they do, a wide range of topics on subjects well calculated to interest the general reader, as well as those who are the students of labor problems.

In this connection we suggest that these bound volumes of the MAGAZINE would be a valuable present on birthday occasions, or as tokens of remembrance, to be presented at any time, and as the price has been reduced to \$1.00 we shall hope to receive sufficient orders to reduce the supply, since no fireman's library would be complete without one.

By addressing LOCOMOTIVE FIREMEN'S MAGAZINE, Terre Haute, Indiana, orders will be promptly filled. Cash must accompany each order.

## JENNESS MILLER ILLUSTRATED MONTHLY.

The May number of Jenness Miller Illustrated Monthly devotes considerable space to short stories. Countess Annie de Montaigne has an elaborate article on "The Rose Gardens of the World." "Happiness in Childhood," "Under our Evening Lamp," "Latest Fashions," "Woman's Future," by Lady Florence Dixie, "Jenny Lind's First Music Lesson," "How Women maybe Wanted" and "Girls of Yesterday and To day," are some of the other attractive features. It may be said that the Magazine is quite up to its usual standard of excellence. Useful articles of genuine value are given as premiums to new subscribers. Sample copy 10 cents. Price \$1.00 a year; published by Jenness Miller Co., 927 Broadway, New York City.

THE deepest well in Europe has an experimental boring made at Schladebach, Germany, in the prosecution of some geological researches. This boring has reached a depth of 5,715 feet, over a mile, but the results so far obtained have not been important.—*Railroad and Engineering Journal.*

# LOCOMOTIVE FIREMEN'S MAGAZINE.

JULY, 1893.

## EDITORIAL.

### A RAILWAY PARTY IN POLITICS.

The caption of this article is reproduced from the May number of the *North American Review*, it being the caption of an article written by Harry P. Robinson, president of the *Railway Age and Northwestern Railroader*.

Mr. Robinson seeks to show that in several states the organization of railway employes' clubs constitute nucleuses of a railway party in politics—as, for instance, in Minnesota, Kansas, Nebraska, Missouri and Texas. Mr. Robinson places the number of railway employes in the United States at 800,000, and estimates in the states named there are from 15,000 to 30,000 railway employes, or an average of 22,500 in each, which would give a total, for the five states named, of 112,500 employes.

Mr. Robinson is evidently in favor of the organization of a railway party in politics, as will readily be seen by the following rosy outlook. He says:

It is easy to see how much strength such a party, if formed, would possess. According to the reports of the interstate commerce commission, there were in the immediate employ of the railways of the United States, a year and a half ago, 749,301 men, or nearly all, voters—which number has now, it may be assumed, been increased to about 800,000. There are, in addition, about one million and a quarter share holders in the railway properties of the country; and in other trades and industries immediately dependent upon the railways for their support, there are estimated to be engaged, as principals or employes, over one million voters more. These three classes, united, would give at once a massed voting strength of some three millions of voters. There are also, in the smaller towns especially, and at points where railway shops are located, all over the country, a number of persons, small tradesmen, boarding house keepers, etc., who are dependent for their livelihood on the patronage of railway employes, and whose vote could unquestionably be cast in harmony with any concerted employes' movement. Moreover, unlike most new parties, this party would be at no loss for the sinews of war or for the means of organization.

The men whom it would include form even now almost a disciplined army. With them co-operation is already a habit, while the financial backing and the commercial and political strength of which the party would find itself possessed from its birth would be practically unlimited.

We do not remember to have seen anywhere in print such a glowing description of a vagary, unless, perhaps, a parallel could be found in some narrative of the Keeley motor, or of some "salted" diamond mine. The writer, to put it mildly, does not understand the intellectual status of the great body of railway employes, the army of 800,000. The intimation that they can, to any considerable per cent., be sufficiently degraded to be marshaled under a political flag to promote stock and bond watering by railroad corporations, is calculated to excite universal laughter, a succession of ha ha's and guffaws in comparison with which a fusillade of champagne corks at a Vanderbilt dinner would be as the chirp of a cricket compared with a discharge of the great Krupp gun.

It is not to be denied that some employes of railways, as well as some editors, and some shopmen and boarding-house keepers, would join "A Railway Party in Politics." Bread and butter has its votaries in this degenerate age, and the worshipers of the railway-pass god could be easily induced to join the party. Numerous lawyers and divines could be *roped* in—creatures in human form who have an exhaustless supply of apostacy for every dollar or dime dropped into their itching palms, the hinges of whose knees are always lubricated and ready to crook at the nod of the fellow who has got the dollar.

Notwithstanding the extraordinary elements of strength the new party would possess at its birth, the "practically unlimited financial backing," the writer is of the opinion that there exists no "immediate probability" of the formation of such a party. A "corporation" party in politics would be just a little too heavy to swim; it would sink with all on board—employes, stockholders, bondholders, boarding house keepers, captain and cook, would all go down together.

The reasons set forth for the organization of "A Railway Party in Politics" are almost as clear as mud. The people, it is intimated, particularly the farmers, are robbing the railroads to an extent that bankruptcy has already come to many roads, and is forever confronting the remainder; all are to be engulfed in disaster by the farmers, who simply demand such rates of transportation as will leave them a little corn bread and pork upon which to subsist. The writer, to whom we are directing attention, says: "But it is possible that all of the capital stock of these lines—one-third of the railway mileage of the country—is water." Yes, more than one-third of the \$10,000,000,000 or \$11,000,000,000 is water—not a cent less than \$4,000,000,000, and the figures are conservative—and upon this vast sum of *fraud*, the mention of which startles the civilized world, the railroads of the country are trying to collect dividends—a fact about which there is no controversy, and because farmers protest and are unwilling to be robbed, the suggestion is made by Mr. Robinson that "A Railway Party in Politics," made up chiefly of railway employes, would be just the thing to enable the railroads to collect dividends

on water, because, by so doing, the roads could pay better wages. But would it not be more in consonance with good government and good politics, of right and justice, to cease collecting dividends on at least \$4,000,000,000 of water, and with the sum thus saved pay the employes better wages?

In discussing railways in politics, it is eminently proper to indicate why laws have been enacted touching directly or remotely railroad affairs. Such meddling of law makers could not have occurred unless there had been a loud and a long demand for it. A man who has a right to speak out upon the subject? The answer might be, and very properly, too, any citizen who feels himself aggrieved. It so happens that a very distinguished U. S. senator, Mr. Cullom, of Illinois, is conspicuous in giving the country to understand why congress passed the interstate commerce law, in a communication to the *Railway Age*, April 14th. The act in question was passed by congress in 1887, and it required eleven years of ceaseless battling to place it upon the statute books of the nation. Referring to the fact, Mr. Cullom says:

All fair-minded men will agree that the condition of affairs in this country in connection with the operation of railroads as common carriers prior to the passage of the interstate commerce act necessitated the exercise by congress of constitutional power by enacting legislation for the "regulation of commerce among the several states."

The passage of the act of 1887 encountered stubborn opposition, and its enforcement has been exceedingly difficult. The greed for money and the determination to secure it, impel men operating railroads and those dealing with them to seek an advantage over others in competition with them to the extent even of violating the plain letter of the law and taking the chances of a fine and imprisonment.

Here the declaration is made that the railroads forced the legislation upon the country by discreditable conduct and dishonest dealings with the people. And he adds:

The world soon forgets past conditions. Doubtless few now remember the utter disregard by the common carriers of the country (I speak especially of railroads) of the common rules of fair dealing with those engaged in shipping, or with localities, prior to the passage of the interstate commerce act. Extortion was practiced at non-competing points; unjust discriminations were practiced by all manner of devices—special rates, rebates, drawbacks; and concessions were given which enriched favored shippers and bankrupted their neighbors. Men engaged as presidents, managers and superintendents of railroads used their positions to amass fortunes for themselves in utter disregard of the public interest. Many of them seemed to know no law; they were a law unto themselves. A patient people finally determined to endure no longer such a condition. State legislatures and finally congress, as a result, adopted the policy of regulation.

The arraignment is simply terrible, and what Senator Cullom says, relating to the necessity for passing the interstate commerce law, is equally true, as a reason why states have interfered to protect their citizens.

With these facts in full view, why should railway employes organize a political party in the interest of railway corporations? What

wisdom is there in such a movement any more than there would be in a trust party in politics, or a monopoly party in politics?

The American people, and none more so than railway employes, want honesty in politics and in business. They suffer much and suffer long, but when fully aroused they enter the domain of rascaldom and cleanse it. The people are honest. As for the corporations, let Senator Cullom be heard.

---

## THE LABOR PROBLEM.

---

We doubt if there is any problem presented for solution, in this problem solving age, that attracts so much attention as the labor problem. There is a large army of problem solvers engaged upon it, some of whom are learned in all the sciences and economics. Such men would solve labor problems by methods, the maturity of which would require centuries of education. Some of these labor problem solvers, without learning in a scholastic sense, seek to be practical, but are forever weakening their cause by contentions about moral and social elevation; others, again, are vagarists, who write and talk at random, and the more they strive to solve labor problems, the less they are solved, while a few catch on to the fundamental idea, and work toward practical results.

In the *North American Review* for January, Mr. David Dudley Field and Mr. Oran B. Taft discuss "Industrial Co-operation" and "Labor Organizations in Law" to find a solution of the labor problem.

Mr. Field, as far back as 1885, says he suggested co-operation as a "feasible scheme for reconciling capital and labor"—when neither in 1885, nor before nor since that date has there been any trouble between labor and capital, and the statement which Mr. Field makes, exhibits him at the outset as an ignoramus. Labor has never had any controversy with capital. It does not fight money or capital in any form. Its controversy has always been with capitalists, a vital distinction to be kept in view when men seek to solve labor problems.

Mr. Field has come to the conclusion that since 1885, when he started out to solve the labor problem, very little headway has been made; on the contrary, he is of the opinion there is now displayed greater antagonism between capital and labor than ever. This condition he finds it difficult to explain, since, during the period designated, men have improved in intelligence. Mr. Field thereupon proceeds to explain, and assumes that his panacea, co-operation, has not been adopted because the "workmen themselves resort to violence and annoyance in order to gain their ends." Mr. Field has a holy horror of "violence" and "annoyance" on the part of workmen, but he has no words of condemnation for capitalists whose outrageous

acts provoke violence or annoyance, and he says "rare must be the occasions in any civilized country that can serve a wise purpose in the redress of wrongs."

In this connection it is eminently worth while to refer to the acts of capitalists in dealing with workmen, which, in numerous instances, are both violent and annoying, and which crush workmen without the slightest appearance of physical force. They kill or reduce to beggary and degradation while the authors of the calamities smile with the blandness of a pirate who makes his victim "walk a plank" and submit to the mercies of the deep sea.

For instance, the capitalist, who has men in his employ, say one hundred, receiving on an average \$2.00 a day, issues an order to reduce wages 25 per cent, or 50 cents a day. The capitalist makes no demonstration of violence; he beats no drum; he fires no cannon. He is less demonstrative than the reptile that rattles before it strikes. And yet, his order is the climax of violence. It is a movement akin to highway robbery. It forces conditions upon workmen, of penury and its attendant evils as certainly as if it had been done with shotged guns. It is violence and annoyance combined. The capitalist robs his workmen of \$50 a day, or for 300 days, \$15,000. The workmen to resist this robbery are at once denounced as violent and annoying but as in the case of Mr. Field's plea not a word is said of the capitalist who perpetrated the wrong, and the incident is characterized as "trouble between capital and labor," when it is simply an effort on the part of workmen to resist robbery.

After all, what is this hullabaloo about "co-operation." What is co-operation? Webster says "co-operation is the act of operating together to one end: concurrent effort or labor," hence all industries now going forward are co-operative and cannot be otherwise. Mr. Field, manifestly uses a term "industrial co-operation" in a way to exhibit his ignorance, he means doubtless "profit sharing," or a joint stock concern, in which labor is made capital. He says;

Let us imagine such an establishment as I suggest. Suppose a factory to be chartered, with a capital of a million of dollars divided into two hundred thousand shares of five dollars each, three-fifths of them to be payable in cash or property, as at present, and two-fifths in prospective labor; the former to be invested in land, buildings, machinery, and whatever else may be necessary for such an undertaking, and the latter reserved for such workmen as may be taken into the concern; the skilled workmen to be allowed wages, say, for illustration, at the highest rates of the market, four dollars a day or more, and the unskilled, two dollars a day, and each one to be registered for four hundred shares. If the earnings were six per cent. on the capital, each skilled workman would be credited in twelve months, that is to say for 300 days' work, with \$1,200 for wages and \$120 for profit. Deducting \$500 for his supplies, including food, clothing, and lodging, there would be left to his credit at the end of the year \$820. which would pay for a hundred and sixty-four shares of the stock. He would then have had his living and become the owner of a hundred and sixty-four shares of the company. In the next year he would acquire a hundred and sixty-four additional shares, and in less than three years would have more than paid for all the four hundred. The rate of wages, the supplies furnished, the admission and dismissal of share-workers, and the discipline of the establishment should be vested in all the shareholders, actual or expectant, while the financial department, and the purchases and sales, should be in the hands of the

cash or property shareholders. Capital and labor would thus be brought into closer communion, and made to lean on each other. To this end the requirement of a cash or property capital would be in part dispensed with, and instead of it an obligation to labor accepted. The share-workman must have the means of living while he is earning the price of his shares. He must be enabled to live as cheaply as possible, by having his supplies furnished at the lowest price. He must have fair wages, and withal reasonable maintenance, and the prospect of bettering his condition by becoming a participant in the profits of the combined labor and capital. But all concerned should have power of superintending the conduct of the workmen, choosing between applicants and dismissing the idle or incompetent, recompensing them, of course, for what they have already earned and saved.

Mr. Field, before he outlines his utopian scheme, practical, if at all, in only a few industries, takes occasion to rehash a few strikes on the part of workmen, but in no instance does he take the trouble to depict the outrages on the part of capitalists whose ceaseless outrage upon labor provoked the excesses of which he complains.

This MAGAZINE is no apologist for violence, but it abhors the vulgar cant of capitalistic hypocrites who are forever dilating upon the wrongs, which, as measured by statute laws, labor, now and then perpetrates, but who never denounce the wrongs inflicted by capitalists, which inflame the passions of workingmen. As for instance, Mr. Field refers to the violence at Homestead on the part of workingmen but makes no reference to Frick's infamous employment of armed and trained Pinkertons to kill them, but for which, no violence on the part of workingmen would have occurred. He refers to the Buffalo strike and the burning of cars, but is silent upon the well established fact, that the railroad officials formed an alliance to defeat a statute designed to protect the men the railroad officials had determined to rob of their rights guaranteed by the law. He refers to the outrages perpetrated in Tennessee by coal miners who were being robbed of work and wages by convicts, but has no word of protest against the infamous law which subjected them to poverty and degradation, and in this way, while pretending to plead the cause of labor by discussing a vagary, omits no opportunity to stab labor and to make it despicable in the eyes of the public.

Mr. Oran B. Taft's idea is that the labor problem can be solved by law. He starts out by announcing three general propositions as follows:

1. That there are three interests involved—the commonwealth or social fabric, capital, and labor; that all these are or must be invested with both duties and rights, defined by law both for their defence and as a means of compelling the discharge of responsibilities. Capital has already an existence in the statutes, enabling it to enforce, as well as to defend, its rights. Having such existence it may be compelled to discharge its duties. Labor itself must have a legal standing of like importance, and for the same reasons. The commonwealth has the right to enact any statute restricting organizations that so disturb affairs as to threaten society; it has the duty of providing for, and enforcing as law, the rights and duties belonging to capital and labor in their relations one to the other.

2. All interests involved must reckon upon the expanding and inspiring influence of the American political and social idea: this country began its career by declaring that all men are born equal; there was to be no law save that of

ability and opportunity to stand between what any man has rightfully accomplished and what any other might; it made each man the peer of every other for every lawful personal interest he might have. Under this influence so rapidly have men gone from the employed to the employer that the distinction in rank has almost disappeared.

3. A third fact which must be kept in view is that labor, competent to organize and direct itself, is something more than a commodity; that the nature of both capital and labor is such that neither may safely be regardless of the rights of the other. All capital has its origin in labor. Labor is vitally dependent on capital. To treat labor as a thing to be bought in the cheapest market, is to treat it as a commodity and not as a man. The public, the commonwealth, sees in this labor a citizen in whom it has a valid interest, and whatever unmans him is inimical to capital itself, to labor and to the commonwealth.

Having formulated his propositions, Mr. Taft proceeds to show how capital and labor can be made equally amenable to law; how "organized labor is to take its place in law and the courts by the side of, and be the equal of capital." Mr. Oran B. Taft is, we apprehend, a lawyer who wants to solve the labor problem. He pleads the cause of labor with immense fervor. He don't want labor treated "as a thing to be bought in the cheapest market" because that would be to "treat it as a commodity and not as a man." He thinks "the public, the commonwealth sees in this labor a citizen in whom it has a valid interest," and therefore, we surmise, Mr. Taft is lying awake of nights to discover a way to solve the labor problem and evidently he believes he has made the discovery.

His idea is to get this man, the citizen labor, organized under the law; each organization to represent a certain craft. This organization or corporation to be capable in law of suing and being sued, to have and use a common seal and have a board of managers with power to make contracts involving the time, wages and labor of all or any portion of its members. In a word the board of managers of the labor organization is to have the power to hire out the members, regulate time and wages, or to make contracts which would be binding upon the organization. This done the "man" or "citizen" capital would at once be on a par with money capital. As matters now stand, only money capital is responsible. A failure on the part of the capitalist to fulfill a contract may lead to the confiscation of his capital, and Mr. Taft wants to solve the labor problem by placing the "man" and "citizen" labor so that if it fails to perform its contracts, it too may be confiscated by imprisonment. He sets forth his ideas as follows:

I. That it will not do for labor to have reason to believe capital has a more solid standing in law than labor.

II. But capital has a more valid existence so far as statutes and courts are concerned, because in making contracts with labor, it has such possessions as may be reached by law in case of failure to execute its contracts.

III. It obtains this position of power in law, only by having made the concession of an unrestricted liberty with its own capital after having failed to perform its obligation recognized by law. For a standing place in the law, under a commonwealth stronger than all parties to any contract, capital voluntarily permits itself to be sued, to be annulled, to lose the right to do business, to be confiscated, if needs be, to make good its contracts.

IV. The anomaly and weakness of the social order with labor not a like

factor in law, is, that only one party in a contract made between capital and labor is in any valid way liable to suffer a penalty, in the form of damages for non-performance. There is nothing in the laborer until he becomes in some sense a capitalist to make him a valid person in the courts; until then he has no right to ask the commonwealth to inflict penalty upon capital since he has no capital of his own to be confiscated in a similar case.

V. A law ought to be made which would recognize the facts. The facts are, that the laborer is a capitalist, his capital is his own person—himself. In a contract he offers on his part himself to do a certain amount of labor.

VI. The laborer who enters into a contract with capital will not occupy the same standing place in common justice and law until, according to statute, it cedes to the same third party, the commonwealth, as representative of the public and social order, the full power in the same certain case to restrict it, to confiscate it. It must be legal for the commonwealth to confiscate capital, as it is; and for the same government, in the same interests to imprison labor, unless it shall offer a money equivalent, whenever the possibility of fulfilling contract is frustrated voluntarily.

Here is the latest solution of the labor problem that has come under our observation. It redeems labor from the degradation of a "commodity" and gives it the dignity of money. It can sue and be sued, just like a capitalist; and as the money of the capitalist can be confiscated, to make things equal Mr. Taft would confiscate by imprisoning the laborers.

To illustrate Mr. Taft's method of solving the labor problem, and bringing about an exact equality of capital and labor in the courts, he would have an organization, say of Locomotive Firemen, incorporated under the law, with seal, manager, etc. A railroad manager wants, say, one hundred firemen. In that case he goes to the manager of the firemen's corporation, states his case, makes the contract relating to work, wages, hours of labor, etc. The contract is mutually binding, and being made in conformity with the statute, which makes capital and labor, or, more properly, money capital and "man" and "citizen" capital equal in law and in the courts, the one hundred firemen take their places on the engines of the road. Very soon thereafter the railroad corporation violates its contract with the manager of the firemen's corporation. Suit is commenced to enforce the contract; judgment is awarded for damages, say for \$5,000. The railroad, to satisfy the claim, hands over to the sheriff one or two old engines and tells him to "sell and make his money."

That is one side of the Taft method of solving the labor problem. Let us look at the other side of the problem.

It is found, we will assume, that the manager of the firemen's corporation, for some cause, fails to carry out his contract; suit is brought by the railroad, judgment obtained against the firemen's corporation for breach of contract, say, for \$5,000. Now, then if the manager of the firemen's corporation has \$5,000 cash, to hand over to the railroad, everything will be lovely, if not, then the law provides for the arrest and imprisonment of the one hundred firemen. The "man," the "citizen" labor, for which Mr. Taft feels so much solicitude, is at once confiscated, imprisoned, while the railroad magnates escape by turning out a couple of old scrap heap en-

gines. Never a capitalist goes to prison, only the workingman is guilty of felony if he violates a contract.

It is such vicious "damphoolism" as Josh Billings would say, that is constantly finding its way into print in first-class publications, written by men who are parasites of capitalists—men whose regard for labor is that which a hungry wolf has for a fat lamb.

Messrs. Field and Taft constitute a brace of writers, who, while professing to be earnestly seeking to solve labor problems, would do it in a way to reduce labor to a condition of vassalage to capitalists in defiance of every ennobling aspiration.

---

## A RAILROAD MASTER MECHANIC AND HARVARD UNIVERSITY.

---

Harvard University is the oldest college or university in the United States, having been founded in 1638, while Yale College was not established until the year 1700.

Harvard College is an immensely rich and aristocratic institution, having been endowed by the state and by individuals from time to time during a period of 255 years.

Harvard is not known as a poor boys' school, the sons of working men do not call it their *alma mater*. Edward Atkinson, the inventor of the Aladdin oven was not educated at Harvard, but he has made enough money, by the discovery that a Yankee workingman can obtain a square meal for 3 cents, to enable him to educate his boys at Harvard.

For some time it was whispered around that some millionaire had bequeathed to Harvard University the princely sum of \$2,000,000, which completely laid in the shade Rockefeller's gift to the Baptist University at Chicago. But who it was that had added such vast wealth to Harvard's plethoric purse, no one could guess; in due time, however, it "leaked out," and it was ascertained that the donor was one Gordon McKay, but, except in a limited circle, no one had ever heard of the millionaire and when all the facts relating to his history were made public, it was learned that Gordon McKay started out in life to learn the trade of a machinist, "way back in the forties," and in that capacity was first employed by the Boston & Lowell Railroad, and it is said that some of the locomotives which now ply between these cities were designed by him.

Mr. McKay is an inventive genius, a self-made and self-educated man. He was under no obligations to Harvard. It did not look after the interests of machinists, nor have a professor to examine locomotives. It devoted its attention to dead languages, which Charles Francis Adams, who is a graduate of Harvard, says is an in-

jury to men who are to deal with practical affairs, and he does not hesitate to assert that he would have made a better business man, if he had not been a Harvard graduate.

Mr. Gordon McKay, being of an inventive mind, later, invented machines for making shoes, and his success revolutionized the shoe making business. The day the McKay machine began sewing shoes, hand sewing began to disappear and money poured into the inventor's coffers in an ever increasing tide. He suddenly became rich, and as his machines multiplied he grew richer, and every day richer still. No one knows how much Mr. McKay is worth, but that his pile is a big one nobody doubts. Indeed, when a man bestows in one lump \$2,000,000 upon a rich university, though the amount be large, no one will believe it interferes with his ideas of luxury and comfort. The only thing amazing about the matter is, that Mr. McKay seems to have forgotten the "hole of the pit" whence he "was digged" and the "rock" whence he was "hewn," the old days when he was simply a workingman, and when the codfish and mackerel and New England rum aristocrats would not have touched him with a forty foot pole, and when Harvard University would have given him to understand that its curriculum was too much persimmons for him, and that he had better matriculate where the *hazing* would be less severe. Under such circumstances Mr. McKay, had he remembered his working days before he became a royal Yankee by his royalties, he might have looked over the field, and with his \$2,000,000, provided the means for a high grade of mechanical education of men and women and thereby shown himself a philanthropist of a high order. It is possible, however, that, now while traveling in Egypt he poses as a man of learning, and very certain it is that Harvard will confer upon him the title of L. L. D., or create a professorship of Leather Latin, Greek Gaiters, Hebrew High Heels, or Wax and Bristle Philosophy, as a Lasting tribute to one who made it possible for men to make shoes who don't know how.

It may be that Millionaire McKay, as he is exceedingly gallant, though beyond three score, may marry a titled lady before he returns to America and this is all the more probable since his last wife, now living, was a mere youth compared with his years. If such should be the case, he would doubtless make another will, giving Harvard only the luxury of disappointment. Already he has several homes, one in Paris, another in Florence, another in Cambridge, and is now contemplating building another in South Carolina. Should he conclude to marry the Princess Wheelbarrow, or the Duches of Mopobroomstick, or Miss Ladyknowswho, Harvard might wish that a crocodile had passed him through its alimentary canal.

At any rate, it does not appear that he contemplates embalming himself in the affections of Yankee laborers, not even to the extent that Edward Atkinson has won the gratitude of New England workmen and women by inventing an oven which extracts all the juices from shin bones and makes a square meal cost a fraction less than three cents, money of the realm.

## RUSSIANIZING THE UNITED STATES.

A treaty has recently been negotiated between the United States and Russia, and simply awaits the proclamation of the President to become the law in all matters agreed upon by the contracting parties. Treaties, it is known, are compacts concocted in secret. In the United States, where it is published to the world that the government is of the people and by and for the people, the people are not permitted to know anything more of the agreements contained in a treaty, until it becomes the law, than if they were Russian exiles working in a Siberian mine. Fortunately, however, according to the adage that, "murder will out," the people of the United States have managed to learn so much of the treaty, as to create the belief that it places the United States in a position of unqualified shame and humiliation before the whole civilized world.

It so happens that Russia is a despotism, the most cruel, brutal, inhuman, murderous, abominable and infamous upon the face of the earth, and the Emperor "of all the Russias," is the one blood-thirsty monster, who is responsible for all the banishments, murders and tortures inflicted upon Russians, because they dare hope for a change of government, because they ask for liberty, because they demand redress for wrongs, and no sooner is a whisper heard of discontent, than imprisonment, torture, death or exile follows. As a result, certain brave Russians plot the death of the autocrat, or they seek to inaugurate rebellion, they plot to overthrow the government, in doing which, they have the unqualified and enthusiastic approval of ninety-nine hundredths of the people of the United States.

Thousands of these Russian patriots are caught; some are murdered, others tortured, others imprisoned, while a ceaseless tide of others flow towards Siberia to linger out their miserable lives in mines. Some of these patriots escape to the United States and publish to the world the truth regarding Russian despotism. The autocrat of Russia very much desires to put his paws on these patriots now under the jurisdiction of "Old Glory," and surpassing all belief, the United States senate votes that he may do so, and thus make the government of the United States *particeps criminis* to every horror Russia inflicts from murder to exile in crushing out the spirit of liberty among her people. As we write, the treaty is in the hands of President Grover Cleveland: if he does not hold it for modification, so that Russian refugees who have sought asylum here are safe from autocratic atrocities, then Russian detectives will invade our shores and drag away any one whom it may be the Czar's pleasure to murder, torture, imprison or exile. In this connection, says the *Chicago Herald*: "We shall not become blood hounds for any European despotism. We are not going to help despots, no matter who they are or what their past in regard to us, to track fugitives from the knout, the galley chain, the mine or the penal colony

across our free prairies or into the seclusion of the free cities of this Republic. The fundamental blunder in the text of the treaty is that it does not discriminate between political and other offenses. Until that discrimination shall be made, and until the power of testing each case arising under it is vested in our own courts, giving refugees, right of counsel, the treaty with Russia, no matter how satisfactory otherwise, will not be acceptable to the American people. We did not destroy fugitive slave laws on our own soil only to revive their principles for the accommodation of old-world slavers or tyrants. In proposing such a clause as this to us, Russian diplomacy has audaciously asked the United States for a political accommodation that would be scornfully denied to her diplomats by England, as England has denied it for generations to all powers; an accommodation she has no right to expect except from the petty, half-savage, tribal or satrapic communities her bayonets pin down or her gold corrupts in Eastern Europe and Asia. No political partnership with despots!" It is to be hoped that the *Herald* is right, but it all rests with President Cleveland; if he does not crush the infamous treaty then the United States from ocean to ocean becomes a hunting ground for such creatures as the autocrat of Russia may designate to entrap the victims of his wrath.

Should the treaty go into effect, and a Russian official be seen dragging some victim of Russian hate away to the infernal regions under the control of the Czar, it would not be surprising if it were found an exceedingly difficult task. Let it once be understood that the senate of the United States aided by the President has placed such power in the hands of the Russian autocrats and by common consent they would become objects of ineffable scorn and ignominy.

---

## THE COLUMBIAN FAIR AND SUNDAY OPENING.

---

From the first, as the pages of the MAGAZINE bear testimony, we have advocated the opening of the Columbian Fair on Sundays. Not because we would regard with indifference the desecration of the Sabbath, but rather, because we regard looking upon the beautiful in art as well as in nature, a form of worship entirely devoid of cant and hypocrisy, superior to any worship narrowed by human creeds and dogmas, superior to all forms introduced by base born bigotry in the worship of God, and because the Columbian Fair has for its lofty ideal the education of the nation, of all the millions who may be so fortunate as to visit the Fair, and by the healthful influences it is designed to exert upon the national character.

Steadily, common sense views have gained an ascendancy over narrow prejudices. The drool of bigots, as was expected, could make no headway outside of the ranks of the votaries of vagaries, and fin-

ally the order came to throw wide open the doors of the Columbian Fair, and let the worshipers of the beautiful and the true, kneel at their chosen shrines, and more than 200,000 persons promptly availed themselves of the privilege and on Sunday, May 28th, thronged the Fair grounds.

To those who are not wilfully blind the spectacle must have been in all regards cheering and in the highest degree satisfactory, for it is said that a very large proportion of those who attended the first Sunday opening were workingmen with their wives and children, and it is still further stated that while the Fair grounds were thronged with people, the saloons and other demoralizing resorts, were practically deserted, a condition of things which the advocates of Sunday opening have predicted from the start, and which if injunctions and other obstacles are not thrown in the way, will make the Sundays of the future, while the Fair continues, distinguished for order, sobriety and all things of good report.

As we write, we are not unmindful of the fact that bigotry is still at work, hoping by hook or by crook to accomplish its designs and close the Fair on Sundays, relying upon some sort of a Federal pronouncement which will close the Fair to those who would spend their Sundays in contemplating the ten thousand exhibits, elevating in their educational influences, and force them to spend their Sundays elsewhere to their own incalculable detriment. But we are sanguine that in the final tournament common sense will triumph, and that those who desire to view the Fair on Sundays will not be denied the privilege by a display of ignorance and bigotry worthy only of the dark ages.

---

In the opinion of the *New York World* "it is time for robust American common sense, which hates shams, loves truth, respects manhood and holds American wifehood and motherhood in reverent honor, to laugh at the silliness of titled pretense, and to teach girls the plain truth that they degrade and dishonor themselves when they marry disreputable or worthless men in order to gain the privilege of playing princess or my lady in a false and decaying society." All of which is very true, but it is also true that a very large class of "robust Americans" love shams, have little regard for truth, manhood, American wifehood or motherhood; and as wealth increases, its possessors become more and more in alliance with European ideas of aristocracy, and this miserable business is helped along by sham Americans who are sent to aristocratic countries, where many of them make themselves and the country they *misrepresent* contemptible.

---

It has just leaked out that during 1891, the United States distilled 117,186,114 gallons of spirits. The bung hole is on top.

STATISTICIAN ADAMS, of the interstate commerce commission, has compiled the earnings of 462 railroads of the United States covering 138,349 operated miles, omitting 37,000 miles of lines operated by companies which did not report. The statement shows that the gross earnings for 1892 amounted to \$951,025,159, an increase over 1891 of \$125,950,303. The net income from operation for 1892, was \$317,334,323, an increase over 1891 of \$43,116,114, and an increase over 1891, per mile, of \$209.

According to the foregoing statement there were in operation 175,349 miles of railroads—the earnings of 138,349 miles being given, or 79 per cent. of the total mileage. The value of the railroads of the country, including water, closely approximates \$10,000,000,000, 79 per cent of which would represent \$7,900,000,000, the net income for 1892 being \$317,334,323, or 4 per cent.—but as at least \$3,160,000,000 of the \$7,900,000,000 is water, and hence a fraud, it is seen at a glance that the railroads robbed the public of \$126,400,000—so glaring has this watering fraud become that Massachusetts is taking steps to crush it if possible. In this connection, it is worth while to remark, if railroad corporations could be compelled to cease robbing the public by levying tribute to pay dividends on water, they could pay their employes better wages and thus put an end to strikes.

---

WHEN there is a landslide, or when a rock gets upon the track, there isn't a bit of parleying—the demand is to remove the obstruction. To do this requires physical effort; that supplied, the obstruction disappears. When there is an obstruction on the track Labor organizations have mapped out for themselves to secure advanced positions, physical effort is not required. Then the mind forces of the order are in requisition, and agitation, discussion, unity and harmony are demanded; and with these, though success may be delayed, victory will come at last and it will come to stay.

---

THE Baldwin Locomotive works, in their operations, demonstrate the rapid growth of railroads in the United States. The works were established in 1831, and during the following thirty years they turned out 1,000 locomotive. The second thousand was completed in eight years, the third thousand were ready in three years. Then, for eight years, two thousand were built; then a thousand were built in two years, and the next year following one thousand were put on the road, and now the works expect to turn out two thousand locomotives a year. That is what may be called progress.

---

IN German festivals, when the order is, "three cheers for the Emperor" any one who doesn't cheer is sent to prison. No wonder 200,000 Germans annually get out of the country.

## CONTRIBUTED.

---

### THE RAPID ELIMINATION OF THE MIDDLE CLASS.

---

BY MARIE LOUISE.

---

Never in the annals of human history was there a time when the people at large was so amply invested with political power and enabled to sway the destinies of the country, as it now is, and has been for these last fifty years. America, first and foremost in liberal institutions, places the power of the ballot in the hands of each male adult. England, since the great victory of the "Reform League" in 1869, has steadily admitted to the franchise a larger and larger portion of the working class. France has manhood suffrage, and all other countries of Europe, except Russia, have the same liberal system of political representation, or something approximate. The natural inference, therefore, would be that the interests of the largest number of voters are catered to and steadily furthered. If there is any truth in the theory of the power of the ballot, a condition of prosperity and individual welfare must have obtained, or if not, why not?

Let every thinking man and woman reason and find out the *why not*; let them discover the cause by which the practical result falls so short of the theoretical speculation. My present object is to deal with conditions as they are, not as they might be.

With labor combinations, boycotts and strikes, with loss of lives and the destruction of public property, with an agitation to restrict immigration, and the desperate efforts of organized labor to oust "scabs" from their bread-earning employment; with an army of unemployed and legions of tramps on the one hand, and multi-millionaires, monopolists, trusts, combines, gigantic corporations centering all commerce in a few enterprises, on the other hand, we behold a middle class assailed from above and from below, tossed, torn and decimated. We may well pause to consider and discuss the forces at work which produce such alarming symptoms.

In a country like America, beautiful beyond the power of description, with a climate delightful and varied, a soil rich and fertile, a wealth of minerals buried in the bosom of the earth, a land of incommensurable natural wealth, which can give abundance to its 65,000,000 inhabitants and even to tens of millions more, how does it happen that newspapers daily record deaths by starvation, and suicides due to incapacity to obtain work and food.

A government of the people, *by* the people, and *for* the people is true to its two first terms, but miserably fails on the third.

Sixty years ago, in the old and the new world, a skilled and

thrifty mechanic had many an opportunity to build up a trade for himself. The second stage of our civilization, that of Democracy, inaugurated by the American Independence and the overthrow of the Feudal System in Europe in 1789, was still in its infancy. One single line divided society into employers of labor and employed.

In the middle of this century, a process of geographical and political centralization in Europe and America began to operate. Bismarck, Mazzini, Napoleon III. and Abraham Lincoln stood as a triumphant negation of *autonomic* liberty, and an affirmation of concentrated political power. At their heels stepped their inevitable shadow, the principle of centralization of wealth and industrial production.

In 1873 the political centralization was achieved, and with a great financial crash, the process of monopolizing land, wealth and natural opportunities set to work with vigor and decision.

In the financial earthquake, thousands of the middle class were hurled into the ranks of the wage laborers, whilst a few ascended to the realm of monopolists and millionaires. That social rent was a second line of division, and once more, as under the Feudal régime, society was composed of three strata: Aristocracy, middle class and wage laborers. This obtained under a democratic government "of the people, by the people and f \* \* \* \* ." Strange phenomenon this! Strange and unprecedented in our civilization!

In 1789 society shook down its upper structure, the effete and cumbrous aristocracy, just as the gardener clips off the withered flower to preserve the sap to the plant. The elimination of the upper part of the social structure in no wise endangered the safety of the rest.

But in our present time the eliminating process is working on the intermediate portion of the edifice, the backbone of the system—the middle class.

Will not the undermined top totter and collapse?

Let no one pass lightly over this most significant fact. Verily, the time has come to look the situation in the face and scrutinize every one of its features. The elimination of the middle class is no trifling occurrence. As it gradually disappears, the place it has occupied becomes a chasm between the millionaires perched on the top of the structure and the swarm of wage workers who stand on the ground. The chasm growing wider and deeper becomes unbridgeable. Can you contemplate the situation without shuddering? This is no pessimistic aberration, no dream after a pork and pie late supper. The thing itself stands naked before our eyes, ominous of calamity.

The corporations, trusts, combines, draw within their octopus tentacles all the wealth, all the machinery, all the land, all the means of labor. No middle-class man can hope to withstand such a powerful competition. Hundreds of that class are ruined daily and descend to the ranks of the wage workers, pressing from the front to the rear and thrusting numbers of unfortunate workmen among the legions of tramps.

All the forces of our present régime are empawned to destroy the average trader and to defeat the efforts of the intelligent working-man to obtain an independent livelihood. Business properties are built and laid out to suit large enterprises and none are within the reach of mediocre means. Wholesale houses sell at double rates—one for the large establishment, another for the small. To the middle-class manufacturer, the raw material for a given article costs as much as does the *same* article *all ready finished* to the millionaire manufacturer.

Press advertisements are beyond the reach of the average trader and are a dead letter for the workingmen save to advertise for a situation of wage earner. A cobbler, or a tailor, or a painter, rooming and working in a tenement house, has no chance of letting the public know of his need of customers. The newspapers refuse to take his *ad* under the head of "situation wanted." He must place it under the head of "business advertisements" and pay thirty-five and forty-five cents a line for each insertion. Leading newspapers send their agents repeated instructions not to receive any *ad* for private labor for the columns of "situation wanted," inserted at five cents a line, but to have them registered under the head of twenty-five cents, and more, a line. The ambitious cobbler, or tailor is unable to pay such rates and is compelled to give up all ideas of building a trade for himself.

The workman out of work and in need, would like to sell a piece of furniture, or of clothing, to procure bread. He might get two or three dollars from a private buyer, but he must advertise his goods. Thirty cents a line (on Sunday 35) for one insertion is asked him. For a sale, repeated insertions are usually needed. Can the poor man afford that outlay? No. Well, he is driven to take his goods to the pawnbroker and is charged interest at the rate of three per cent. *per month*. (We have a law against usury, I am told.)

In a few months the interests have absorbed the value of the article. Or, he calls a second-hand dealer, and that for which a private buyer would have paid three dollars, goes for fifty cents. Pawn-brokers get wealthier and wealthier in direct ratio as the middle-class man becomes wage laborer, the mechanic gets poor and the poor lands into trampdom.

Obviously the whole dead weight of our economic system bears to sink the weak lower and lower and to raise the strong higher and higher.

Apologists of the present régime argue that a middle-class man ousted from his own business and employed in a large company may earn a salary larger than the total sum of his net profits had been.

Admitted. But what does it prove, if not the untenable condition of middle-class commerce? Besides, is it nothing for a man in business to lose the nest he has built with toil, care and anxiety, and go as a hired help in another man's establishment? Not all situations bring a large salary, and those which do, entail on their holders

more worry and general mental misery than persons who have not occupied such posts may know, and those who have, care to acknowledge.

The man who fills a responsible position in our modern business establishment is facing the necessity of stifling his dignity and humane feelings. He finds himself entangled in a net of conspiracies and assailed on all points by his fellow employes. Does he possess eminent mechanical or other knowledge, he is held as a standing menace. Those above him fear him, those below scoff him, all hate him. His value as a worker will never save him, his downfall is but a question of time.

Is the man too upright to accept bribery and close his eyes to work half done or badly done, the "sweaters" and their indoor accomplices decree that he must go, and so he does, willingly or unwillingly. Fortunate is he when his good man depart with him and not before. The scramble, and war, and corruption carried on within the walls of those commercial palaces have no parallel, not even in our political institutions, which at all times fill us with disgust. The high salaried employes devote but little thought to the interests of their firms, those who appear devoted are soon under ban. In the scuffling and wrangling carried on in all the departments of a business house, more goods are wasted and damage done than would double and triple the wages of the operatives. These, of course, foot the bill.

These terrible symptoms are derived from the injurious system of monopoly, the elimination of the middle class and the plethoric condition of the labor market.

From this disturbance in the economic equilibrium, serious issues surge all around us. Labor organizations close their ranks for action. A collision with the law has just taken place in the case of the Ann Arbor railroad strike, and this is a bad omen. To the working class the law is a sharp edge to encounter, and to the law the working class is a rugged edge to withstand. A hostile meeting is fraught with danger to both sides.

The restriction of immigration is another movement sprung from the overflow in labor's ranks. Can we wonder at the workingmen demanding such a legal measure?

Doubtless, such attitude clashes with the ethics of a free country like America. But the speedy transposition of the middle class into the wage-earning class, and the steady addition of workingmen to the list of tramps and criminals, is a process far more inimical to the ethics of freedom than a restriction, and even a suspension, of privileges to immigrants. To inquire and answer, whether or not Russian Jews, Italians, French and other foreigners are desirable citizens is, in this instance, a mere waste of pen and ink. All European countries may furnish a contingent of desirable and useful citizens. By their mutual contact, both Americans and foreigners are benefited. But this is not the present question. Neither the qualities or peculiarities of immigrants, nor theories of liberty

denied or sustained, are at the bottom of the present issue. The question is one of material urgency, it is a question of *bread*. When our people are suffering from forced idleness and privations, is it not absurd to blame them for objecting to have their scanty means of livelihood shared by new immigrants?

Nevertheless, were it not for the iniquitous monopolizing of all wealth (natural and produced) in the hands of a few, American toilers and millions more of immigrants could enjoy in this republic the fullest measure of life's blessings.

"Man's inhumanity to man  
Makes countless millions mourn."

## HISTORY OF RAILROADS.

---

BY FRANK A. MYERS.

---

Since special efforts have been made to collect the first fruits, or earliest steps in the construction of railroads, for the great World's Fair now in progress at Chicago, a very brief history of this wonderful unifying and great civilizing invention may not be regarded as inapposite. In short, railroads make the Columbian Exposition a possible success, for they shorten distances and save time. Imagine this great quaternary celebration in progress without a railroad in the country. Excepting the alphabet and the printing press, Macauley declared that those inventions which abridge distance have done most for the civilization of the human species.

The application of the wheel for carrying purposes has brought about many devices for carriages, and many inventions for propulsion. At first only the common roads were leveled and hardened for the easier motion of the wheels, and as early as 1672 Mr. Beaumont used wooden rails in a short road at the collieries near Newcastle-upon-Tyne. Four-wheeled carts were drawn by horses upon these straight, parallel wooden rails. The iron rail first came into use at Whitehaven, England, in 1738. In those days the road-bed was graded and filled in with gravel, ashes, or coal waste to make a solid track for the horses—the only motive power then—to walk upon. The first iron railway authorized by Parliament, except a few built by canal companies to facilitate the transportation of the products of adjacent coal mines, was the Surrey railroad, extending from the river Thames, at Wandsworth, to Corydon, which authority was given in 1801. The great initiative in railroad building had now begun, and improvements in road-bed, rails, and the devices for fastening them next occupied the inventive mind of the civilized race. Later steam locomotion was dreamed of. It was found

that with a flanged and flat surfaced wheel moving on a flat rail one horse could do the work of forty on a common road. In 1759 Watt conceived the possibility of steam engines, and patented one in 1784. Oliver Evans, a citizen of the City of Brotherly Love, patented a steam wagon in 1782, and sent the drawings and specifications thereof to England in 1787 and again in 1794-5. In the year that Watt patented his steam carriage, his assistant, Murdoch, constructed a working model of this steam carriage. Trevithick and Vivian patented a high-pressure locomotive engine in 1802, and two years subsequently built one for the Merthyr-Tydfil railway in South Wales, which worked well with only light loads on level surfaces. The wheels slipped on grades. Finally eight driving wheels were tried to secure adhesion to the track, and also levers attached to the rear of engines and operating like the hind legs of a horse. George Stephenson built his first locomotive in 1814, and it traveled at the rate of six miles an hour. The French engineer, Seguin, in 1826, increased the evaporative power of the engine by means of small tubes running from the fire-box to the escape-stack. The Rocket was built by Stephenson and Booth in 1829, and its weight was four tons and a quarter, and its speed thirty-five miles an hour. Five years thereafter the Firefly drew a loaded train at the rate of twenty miles an hour, and in 1839 the North Star attained a speed of thirty-seven miles an hour.

The first railroad for the accommodation of passengers was the Stockton and Darlington road, the product of the combined genius of George Stephenson and Edward Pease, which was opened September 27, 1827, a new era in the history of the human race. Five years later the Liverpool and Manchester road was opened to the convenience of the general public. It was designed to carry passengers at a very high rate of speed. The expense of horse power was too great for this purpose, and therefore it was decided that stationary steam engines, at stated intervals along the road, should be used instead. But the success of the locomotives of Stephenson, Ericsson and others annulled this cumbersome idea and brought about the new system of locomotion of almost limitless velocity and capacity. Engines are now built of more than a hundred tons weight; the average weight is, perhaps, over fifty tons.

The first railroad in the United States was the Quincy railroad, begun in 1825 and finished the next year. It was projected by Gridley Bryant, a civil engineer, and completed by him and Col. T. H. Perkins. It was designed to carry granite from the quarries of Quincy, Mass., to the nearest tide-water, for convenient shipment by vessel. Including its branches, its length is four miles, and its first cost was \$50,000, stone sleepers, eight feet apart, being used. The first turn-table ever used, designed by Bryant, is said to be still in good order. He also invented the portable derrick, and the switch, or turn-out, and the eight-wheeled car.

The second railroad in this great country of ours was laid out in January, 1827, and opened in the following May, extending from

the coal mines of Mauch Chunk, Pa., to the Lehigh river, and with shunts or sidings, or side-tracks, was thirteen miles long. It was operated by gravity, though mules had to be used to return the empty cars to the mines.

Already the progressive forces of the American people were at work, and Horatio Allen was sent to Europe in 1827 by the Delaware and Hudson Canal Company, to buy three locomotives and the iron for a railroad, which was built the next year from the coal mines at Honesdale to the terminus of their canal. One of these three locomotives, built by George Stephenson, who may be called the father of railroad engines, reached New York in the spring of 1829. The one built by Foster, Rastrick & Co., of Stourbridge, arrived not long afterwards, and was put into service on this new railroad in the latter part of the summer. It is positively declared that this was the first locomotive actually put into practical use in this country of ours.

In March, 1827, the Maryland legislature granted a charter to the first railroad company in America authorized to carry on the business of a public carrier. Its capital stock was only \$500,000. Horses were to be the motive power, and relay stations were built and horses were used after the road had been completed to Frederick. This was the beginning of the Baltimore and Ohio, the date being July 4, 1828.

Peter Cooper, at the time a citizen of Baltimore, built a small engine for this railroad in 1830, called the "Tom Thumb," with upright boiler. It was the first locomotive built in America, and weighed only about a ton. It attained a speed of eighteen miles an hour, carrying the directors of the road and some friends in an open car.

Several States now granted charters for railroads, and operations were begun in South Carolina in 1829 upon a railroad designed to connect Charleston with the Savannah river. Six miles of this line were completed that same year. The horse locomotive was designed to be used, and the device of C. E. Detmold, in which a horse walked on an endless platform, was adopted. The Kembles, of New York, built the steam locomotive called the "Best Friend," which was put upon this railroad late in the summer of 1835. The eight-wheeled double bogie carriage was first used by the Baltimore and Ohio road in 1834, and was built from the designs of Ross Winans.

The Mohawk and Hudson railroad, from Albany to Schenectady, was begun in August, 1830, and in little over a year carried 387 passengers a day. In 1832 a locomotive with a load of eight tons moved on it at the speed of thirty miles an hour. Several railroads were begun now in 1830 in the Pennsylvania coal fields, and gave a great impetus to that new and enlarging industry. A railroad was built in 1831 from Richmond to the coal mines, thirteen miles away, and in April of the same year the New Orleans and Pontchartrain R. R., four and a half miles long, was opened up. The great need of railroads and their demonstrated practicability

now brought about their multiplicity very rapidly, and in 1832, it is stated, that in Pennsylvania alone, sixty-seven were in operation. The completed lines in 1837 exceeded in length those of any other country in the world. A little later Congress stimulated this wonderful field of industrial enterprise by giving to the great trunk lines, lands lying contiguous to their projected routes. The first act of this kind was passed by Congress in the winter of 1849-50, granting to the Mobile and Ohio railroad about 1,000,000 acres of adjacent public lands. Congress in 1862 authorized the construction of a railroad across the continent to the Pacific ocean, which was the pet idea of Mr. Asa Whitney. On May 12, 1869, railroad communication was opened by means of the Union Pacific from the Atlantic to the Pacific, binding all parts of the country in one strong iron bond of unity. The "trackage," or miles of line of railway, in the United States at this time is set down in these terms by R. H. Edmonds in the *Engineering Magazine*, basing his deductions on the last census:

Railroad construction progressed rapidly during the decade. It is difficult to realize that whereas we now have 170,600 miles in operation we had only 93,200 miles in 1880. At the end of 1890 we had 166,000 miles—a gain of 73,500 miles during the decade, or about eighty per cent. Thirty leading roads, which operated 31,500 miles of track in 1880 and hauled 96,000,000 tons of freight, in 1890 operated 76,400 miles and hauled 262,900,000 tons. The number of passengers carried by these roads increased from 58,400,000 to 183,000,000. The number of locomotives on all the roads in the United States increased from 17,900 in 1880 to 32,200 in 1890, and the number of passenger, freight and baggage cars from 556,000 to 1,092,000. The capital invested in railroads as represented by bonds and capital stock was a little less than \$5,000,000,000 in 1880, and a little less than \$10,000,000,000 in 1890.

---

## FAIRLY CAUGHT.

BY GEORGE C. WARD.

Although my fishing hook may be nothing but a bent pin, clumsily devised, methinks that I can distinguish a single taxer wriggling at my line's end. Mr. Borland, in the November number of the *MAGAZINE*, discourses philosophically about "Mr. Ward's louse," which, in various forms and at various times, has been apparently done to death, but which has persisted in putting in a reappearance, apparently enjoying vigorous life. I am not troubled with Jerusalem travelers, but am prosecuting a vigorous hunt for a lively single tax insect, which seems to be closely allied in characteristics to the historical "Dutchman's flea." This ubiquitous insect, it will be remembered, possesses a reputation which justly entitles it to the

soubriquet of the "Great Alibi," and enjoys a faculty of being able to invariably prove that it is not where one is ready to swear it certainly is and when one is sure that the thumb is securely and surely planted upon its frisky anatomy, lo and behold, when the thumb is raised, the insect proves an alibi by mysteriously disappearing.

The single taxers, headed by their eminent statistician, Mr. Thos. G. Shearman, unanimously estimate the revenue to be derived from the single tax upon the basis of the five per cent. upon the land values of the nation, constituting the rent now actually paid by tenants to individual landlords and the rent individuals would be willing to pay for land now held out of use, were the government to become the universal landlord and offer such land for rent. This five per cent. is figured impartially upon all land values, as well upon land at the "natural margin" as upon the most valuable land in use, the prospective single tax being affirmed to be the "*rental value*" of all land having any value, from government price up to fancy and fabulous figures, whether in use or held out of use.

But when confronted with the proposition that rent paid to non-occupying landlords, specially upon valuable lands in cities, forms an artificial and unnatural addition to the "natural price" at which commodities should be sold, and that such rent forms no component part of the four prime factors, Land, Labor, Transportation and Distribution, which should limit the natural price of commodities to purchasers for use and consumption—or when it is pointed out that such rent thus paid for the use of land is public robbery for private enrichment, and that taking such rent as a tax would simply perpetuate robbery, and call the plunder a tax—the single taxers enter into a long argumentative dissertation about "natural margin," "margin of production," "natural price," &c., &c., in an effort to show that the rent they propose to take as a tax is not robbery at all, and would exist were there no such individuals as landlords, being simply the difference in degrees of fertility possessed by some land over other land, and then they gravely proceed to figure such *difference* (?) in fertility at a *uniform* degree of five per cent. upon the value of *all* lands. Like the Dutchman's flea, the single taxer's factor rent disappears just when you think you have your thumb squarely and fairly upon it.

Having, however, been driven into a corner by my peculiar and self-chosen line of argument, Mr. Borland now writes:

I am convinced that Mr. Ward shall now regard the single tax in a somewhat different light, and I believe that, after due reflection, he shall be willing to admit that in transferring his arguments from one set of propositions to another and entirely different set, without doing me the justice to believe that my interpretation of his original propositions might be different than his own, he has been guilty of a slight breach of the ethics of controversy.

The single taxers must get together and agree upon a uniform identification of the factor they call Rent, which, they contend, if taken as a tax, will provide a fund sufficient to defray all expenses of National, State, County and Municipal government. Mr. Shear-

man says such factor, or fund, is the average prevalent rate of interest of five per cent. upon the actual value of *all* lands and lots, which interest is now absorbed by landlords.

Mr. George says:

What I therefore propose as the simple and sovereign remedy which will raise wages, increase the earnings of capital, extirpate pauperism, abolish poverty, give remunerative employment to whoever wishes it, afford free scope to human progress, lessen crime, elevate morals, taste and intelligence, purify government and carry civilization to yet nobler heights is—to *appropriate rent by taxation*.

But Mr. Borland contends that Mr. George means nothing but purely "economic" rent, and *not* the monopolistic rent, the absorption of which now makes landlords rich.

Mr. Borland says:

Before proceeding further, I want to say that the claim that single taxers do not distinguish between economic and monopolistic rent, and that their intention is to confiscate any portion of monopolistic rent under the complete operation of the theory, is really the silliest objection the opponents of the theory have ever advanced. The fundamental thesis of the single tax economy is that the very first effect of its application would be to utterly destroy monopolistic rent, leaving nothing but the pure economic rent of society upon which to levy the tax.

"Society?" But Mr. Middleton, another eminent single tax champion, says:

If we accept Mr. Stuart's definition of economic rent, I am certain his proposition can apply only to some such minds, certainly not to mine.

Before we can attempt to estimate the sufficiency of economic rent as a fund to tax, we must know what economic rent is.

If that rent only is economic rent which would appear in a perfect state of freedom, and if we accept the doctrine which Mr. George himself seems to teach in some places, that only such rent can be used for government purposes, then Mr. Stuart's point is indeed a vital one.

Mr. Stuart, Mr. J. W. Sullivan and some others have lately sought to restrict the meaning of the term economic rent to a something which, in the present state of society, it is utterly impossible for any one to determine. How can Mr. Stuart or any one tell what even would approximately be the pure economic rent in a perfect state of freedom? It is merely a matter of conjecture or theory as regards either its sufficiency or insufficiency.

Thus does Mr. Middleton repudiate Mr. Stuart's definition of "economic" rent, although in so doing he throws overboard and entirely discards what Mr. Borland says is the "fundamental thesis of the single tax economy," and also ridicules the idea that there is any fund to take as a tax, other than the spoils now absorbed by non-occupying landlordism. Get together, gentlemen, get together.

So far as Mr. Borland and myself are concerned, I am getting along nicely, thank you. My double back-action style of argument serves its purpose admirably and is gradually forcing Mr. Borland to an understanding and admission of the strength of my position, though it does seem to ruffle his feelings somewhat. He hung on pretty well to his omnibus term, economic rent, until forced by stress of circumstances to divide it up into "economic" and "monopolistic" rent.

In March, he said:

If Mr. Ward had attended to my definition of "natural price," he would have saved himself the trouble of introducing that illustration of the store rooms. No, the \$24,000 paid as rent does not increase the price of the goods sold. Why not? Simply because rent is not a part of price. The merchant is enabled to pay a yearly rent of \$1,200 because of the volume of his business, not because the natural price of his goods is increased by the payment of rent. A location where 100,000 suits of clothes or pairs of shoes may be sold yearly is a better location than the one where but 1,000 of such things may be sold, supposing price in each instance to be the same, and the larger rent which attaches to the superior location is but the recognition of this self-evident truth; the demonstration is obvious.

Yes, the man who carries on business on his own premises has an income larger than the man who pays rent for his premises by just the amount of the rent, provided their business is of the same volume, and carried on at the same expense. But let the man who pays rent attempt to place himself on the same terms as to income as is the man who pays no rent by including his rent in the price of the goods sold by him, I am inclined to think he would soon discover his mistake.

And, between the two paragraphs just quoted, he says:

"How does rent rob and oppress the people?" This question is further evidence of Mr. Ward's neglect to attend to the premises of the argument and his inability to distinguish between the truth of a principle and its application. Who ever told you that rent robbed and oppressed the people, Mr. Ward? I am sure no thorough single taxer ever did so. Let me once more state the single tax position with respect to rent: Rent exists because of natural laws, and nothing which comes naturally can, of itself, rob or oppress the people; natural laws are all beneficent and for the good of humanity when given perfect application. The people are not oppressed because of the existence of rent, but they are oppressed because rent is made the means for private enrichment instead of being applied to its natural uses—the support of the social organism. It is not a question of the existence of a fact, but of the application of a fact.

Thus proving that the term rent, as used by him, included rent paid to landlords, and that he considered such rent as *natural*, existing "because of natural laws," and only monopolistic because paid to enrich individuals, which would not be the case were it taken as a tax for the support of the social organism.

But in June, forced into a corner by my reply, he says:

That monopolistic rent is an indirect tax upon consumption, is a proposition I have never sought to deny; first, because it has never been affirmed, and I have, therefore, had no chance to deny it, and, second, because I have no wish to deny it while knowing it to be true.

Of course, monopolistic rent could not be "an indirect tax upon consumption" unless it was *included in prices of goods sold*. Mr. Borland has learned lots since last March. The last quoted paragraph from his article in the March number of the MAGAZINE is an all sufficient answer to his assertion in the June number couched as follows:

As it is, Mr. Ward has been reasoning from one understanding of the term while I have been reasoning from another, with the consequence that neither of us has been able to make his reasoning appear logical to the other. Now that we are at one as to the meaning of the term "economic rent," we shall have little difficulty in arriving at a clear understanding of our real points of difference.

My understanding of "economic rent" has always been the rent which arises naturally by reason of free competition for land of given conditions, which idea is expressed by the Ricardian formula; it is this idea I have always had in mind whenever I have used the term "economic rent." Whenever I have desired to express the present rent of society I have either used the term "speculative rent" or so otherwise qualified the term "rent" as to leave little doubt as to my meaning, as Mr. Ward may easily discover by referring to my published utterances.

\* \* \* \* \*

With his new understanding of the term "economic rent," I wonder that Mr. Ward's sense of justness and fairness permitted him to advance these propositions in such a way as to create the impression that they are the identical ones he has all the time been engaged in defending, and which I have denied. The propositions which Mr. Ward has heretofore been engaged in defending, refer wholly to economic rent.

*Mirabile dictu!!!* Compare the two expressions thus quoted from the same article. "Pure economic rent of society," and "Whenever I have desired to express the present rent of society I have used the term 'speculative' rent." Mr. Borland must get *himself* together.

My pinhook is a daisy. Mr. Borland is between the horns of a dilemma. Either he did not understand, in March last, that rent paid to landlords for the use of business lots was "speculative" or monopolistic rent, or else, as I suspected all along, he, in common with nearly all other single taxers, used the terms "rent" and "economic rent" in the sense of covering and including both natural, or purely economic rent, and speculative, or monopolistic rent. My whole argument has been made in an attempt to show that rent paid for the use of business lots was an artificial and unnatural *addition* to the "natural" price of commodities sold, and hence an indirect tax upon consumption. His whole contention has been that rent so paid was not so included and was not an addition to natural price. He cannot thus evade the issue by claiming that he was writing of "natural" rent, because he never used the term "monopolistic." He plainly treated of rent paid to landlords, be it called by whatsoever name it may.

Mr. Borland says:

The statement that I have tried to confine the argument to agricultural lands is false; it is a haphazard assertion made without any regard for the facts. My reasoning has always applied to *land*, without reference to where it may be situated; I have approached the subject with a full understanding of the fact that the law of rent is as fully applicable to urban as to agricultural communities.

Perhaps so. But when it has come to a consideration of arguments advanced by me concerning monopolistic rent in cities and towns and in the direction of proving that the term rent did not apply in the same sense to lands used for the *production* of wealth and lands used for the *absorption* of wealth. Mr. Borland has always evaded the issue by a statement like the following, from the August number of the MAGAZINE:

Rent is a social product, and I do not believe Mr. Ward is willing to go so far as to claim that there is any inherent peculiarity about lands used for business purposes, that should fence them off from the operation of the general law of rent, which is:

The rent of land is determined by the excess of its produce over that which the same application can secure from the least productive land in use.

Thus it is with the single tax flea. It devolves upon Mr. Borland to show just what kind of crops business lots "produce," and what buying and selling commodities have to do with raising crops. He might also, while he is at it, explain what *society* has to do with the productiveness of land.

But I ought not to complain. In his latest effort, Mr. Borland has receded from all his former propositions and conceded all I claimed. Great is the pin-hook style of argument.

I shall now await, with interested anxiety, an authoritative statement of just how large a fund is expected from the appropriation of natural or purely economic rent, as a tax. I shall also expect Mr. Borland to explain the manner in which economic rent attaches to residence sites and business lots and the degree of productiveness possessed by each of these classes of land. We are now nearly together and in order to lessen the gap, I am willing to concede that, with use and occupancy as a prerequisite to the claim to, or ownership of land, it would be entirely just to each and all that natural, or purely economic rent should be taken as a tax for the use of the community. We shall, perhaps, at last succeed in pinning down that flea, so that he cannot get away.

A few more words, and I am done. Mr. Borland says:

Mr. Ward's rather extended quotation from "Protection or Free Trade" is not pat; it contains nothing whatever to prove what Mr. George's intentions are concerning monopolistic rent.

He does violence to his own intelligence and to that of his readers when he makes such an unwarranted assertion. The quotation from page 183 of *Protection or Free Trade* is as follows:

And to prove that Mr. George did, at one time, propose to perpetuate the robbery of the masses by monopolistic rent, through the medium of the single tax, I quote as follows from page 183 of *Protection or Free Trade*: /

For a full exposition of the effects of this change in the method of raising public revenues, I must refer the reader to the works in which I have treated this branch of the subject at greater length than is here possible. Briefly, they would be threefold:

In the first place, all taxes that now fall upon the exertion of labor or use of capital would be abolished. No one would be taxed for building a house or improving a farm or opening a mine, for bringing things in from foreign countries, or for adding in any way to the stock of things that satisfy human wants and constitute national wealth. Every one would be free to make and save wealth; to buy, sell, give or exchange, without let or hindrance, any article of human production the use of which did not involve any public injury. All those taxes which increase prices as things pass from hand to hand, falling finally upon the consumer, would disappear. Buildings or other fixed improvements would be as secure as now, and could be bought and sold, as now, subject to the tax or ground rent due to the community for the ground on which they stood. Houses and the ground they stand on, or other improvements and the land they are made on, would also be rented as now. But the amount the tenant would have to pay would be less than now, since the taxes now levied on buildings or improvements fall ultimately (save in decaying communities) on the user, and the tenant would therefore get the benefit of their abolition. And

in this reduced rent the tenant would pay all those taxes that he now has to pay in addition to his rent—any remainder of what he paid on account of the ground going not to increase the wealth of a landlord but to add to a fund in which the tenant himself would be an equal sharer.

Is Mr. Borland suffering from mental atrophy, or does he count upon the ignorance of his readers?

If the foregoing quotation has any meaning at all, it most decidedly means that the single tax, or rent taken as a tax, would be *exactly* the same amount as is now paid by tenants to landlords, less the taxes levied upon "buildings or improvements." Oh, that frisky, frisky flea. Mr. Borland may know that Mr. George means to take as a tax natural, or economic rent, only; but Mr. George has a very peculiar way of expressing his intentions. Get together, gentlemen, get together.

---

## BREAD CAST UPON THE WATERS.

BY R. V. MCBAIN.

---

Well Polly! what are you going to do with him?" inquired Tom Brown of his wife, who, with a troubled expression on her kindly face, was looking at the tear-stained, smoke-begrimed face of an infant she held in her arms.

"Do with him! Really Tom, I don't know what to do with him!" she responded in a perplexed tone. "He is such a bright looking little mite that, if we were able, I should like to keep him. But that is out of the question, I fear, for we have so many children now that we can scarcely make both ends meet."

"True enough, Polly, true enough!" rejoined her husband, laying his hand on her shoulder in a caressing manner. "But, really, it seems to me that the board and lodging of this little chap won't add much to our expenses, and I think it is our duty to give him a home until his friends may come for him."

"But Tom, you forge—"

"No I forget nothing," broke in impetuously Tom. But here is the meat in the cocoanut: the good people of this village have declined to burden themselves with the little fellow; his parents, both lying cold in death, are now in the undertaker's hands, and, in consequence thereof, the child must either be taken under our roof, or go to the County-home."

"To the County-home he shall never go if I can keep him from it" said his wife firmly. "Tom it shall be as you wish, and, if it is the will of our heavenly father that no one shall ever come to claim him, he shall be to us as a son."

"That's right Polly, that's right," said her husband in a pleased tone. I knew your heart was in the right place."

"Who knows," soliloquized Polly, as, after having given the little orphan a bath and put him in a cradle, she stood looking at his cherubic face, "Who knows but that this beautiful child has been sent to us for a purpose. God moves in mysterious ways his wonders to perform." And bending forward she kissed the sleeper and tip-toed out of the room.

In the early morning of March 1st, 1850—the day my story begins—the prosy little village of Driftwood was the scene of a frightful railroad accident. The New York Express, having collided with a freight train while running at a high rate of speed, had been hurled down an embankment, and utterly demolished.

The thunderous roar of the exploding boiler having been heard at the roundhouse, Tom Brown, an engineer, with a wrecking train and crew had been hastily despatched to the fatal spot. After a stubborn fight they had succeeded in extinguishing the flames that were devouring the wrecked cars, and rescuing from the very jaws of death many who had been pinned down by the broken timbers. From among the debris, the bodies of a strongly-built, handsome young man, and a comely young woman, holding tightly clasped to her breast an infant not a year old, had been exhumed. The man and woman were dead, but the child was uninjured.

The clothing of the dead pair, who were supposed to be man and wife, and the parents of the baby, had been thoroughly searched for something by which they might be identified, but without success.

Engineer Tom, with a heart swelling with pity, then caught up the newly-made orphan in his sturdy arms, and, with tears in his voice, begged that some one of the many bystanders, who had been loud in their expressions of pity, might take the baby and care for him until he should be called for by his friends.

But no one had seemed willing to assume the responsibility of such a charge, and one man advised Tom to send the child to the Poor-farm, adding "That more than likely no one would ever claim him." Tom Brown was a poor man and the father of six small children, one of which was a helpless cripple, yet he determined that the baby should not go to the Poor-farm, so, carrying him home, he placed him in the arms of his wife; and urged that he should be taken into the family. With what success we have already seen.

Days, months and years rolled by, and still the identity of Richard Brown—as the orphan child had been christened—remained wrapped in obscurity. Little Dick, as Tom Brown loved to call his protegee, was soon taken out of the skirts of infancy, and put into the pantaloons of a six-year old. He then entered the village school, and, ere many years had elapsed by, was regarded as one of the brightest pupils in it.

At the age of fifteen he began working in the machine shops of the railroad company. Here his thirst for knowledge kept pace with his years and opportunities, and ere he had been thus employed a year

he had become so thoroughly conversant with the different parts of a locomotive as to be able to give the name and use of every casting used in their construction. He had developed into a strongly-built, handsome boy, who loved those sports calling for courage and activity as did the Spartan youths of old: yet he had chosen for his motto "Work before play," and if he had a duty to perform he did it with all his heart, never shirking any part of it no matter how menial it might be. This phase in Dick's make-up soon attracted the attention of the Master Mechanic—a man grown gray in the service—who, noting the rising genius and manly courage of the youth, advanced him as rapidly as his years and bodily strength would permit of, and at the age of 18 he took him from the shops and put him on an engine as fireman. Here he acquitted himself in a manner highly satisfactory to his friends, and at the age of 21, after having passed a very creditable examination, he was advanced to the rank of engineer.

One evening—a little more than a year after Dick's promotion—Tom Brown and his wife, both grown old and gray, sat by their fire-side. Polly was knitting as usual, while her husband, who had been reading but had allowed his paper to fall to the floor, sat gazing vacantly into the fire. After having sat thus in silence for several minutes, the old engineer took off his glasses, and, polishing them briskly, said:

"Polly, to-morrow will probably be the last time I shall run an engine!"

"Why, what's wrong Tom?"

"O, nothing particular, except that the time of my train has been quickened to 50 miles an hour, and Dick said that I was getting too old for that speed; and, feeling that he was right about it, I tendered my resignation."

"I am glad of it Tom," said Polly blowing her nose in rather a suspicious manner, "and, although I hate to see you retiring from the service of the Company while you are still strong and healthy, I think it is better so than to continue at the throttle until old age dulls your sensibilities and causes you to commit some error that might cause loss of life."

The following day, about four P. M., Engine 75 stood on the main line headed south. Our young friend, Dick, moved about her, oil-can in hand, giving the journals and bearings a final oiling before starting on his run.

The engine was hot, and, as the young engineer, moving to the gangway, placed his foot on the step, the steam lifted her pop-valve and it's shrill scream awakened the slumbering echoes among the mountains. At that instant a brakeman, who had leaped from a freight train that had just pulled onto a siding near by, came running toward him with all speed; his face and hands were begrimed with coal-dust; his eyes had in them a look of untold terror; great beads of perspiration stood out on his brow; the lines of his face were tight-drawn, and his voice came with a gasping sound as he shrieked:

"The Express! the Express! I forgot to close the switch at the east end of Miller's Siding! Oh, my God! what shall I do?"

"That's father's train," groaned Dick, his face becoming colorless as he hurriedly consulted his watch, "I must back up six miles in six minutes," he gasped between his tightly shut teeth. And, springing into the cab, he threw the reverse-lever over and opened wide the throttle, and, as the engine shot to the northward, he shrieked to his fireman:

"Keep her hot Jack, for the Express will be due at the east end of Miller's in six minutes, and the switch is open!"

After that no word was spoken by either for several minutes. The fireman with white, scared face, fulfilled his duties. The engine, rolling and plunging, shot along the bright rails like a thing mad with fright. With a roaring rumble she dashed over bridges and culverts, her drivers flying around like buzz-saws, and her exhaust so short as to sound like the humming of a bee. As the trembling, throbbing machine, struck an eight-degree curve that did not have sufficient elevation for such fast running, her driving-wheels lifted from the inside rail, and for an instant it seemed she must leave the track; but Dick eased her with the air-brake, and, settling back on to the rail, she dashed onward with constantly increasing speed.

"We are within a mile of the Siding, Jack!" shouted Dick leaning toward the fireman. "Get down on the step and be ready to fly off when I slack her up at the switch. "My God:" he groaned, looking at his watch, "four and three-quarter minutes gone. If the Express is even a few seconds ahead of time I shudder to think of the fate that may overtake the poor souls aboard of her."

Within less than a minute the panting, throbbing engine slackened her speed, and gliding by the open switch, almost came to a stop. As Dick threw the reverse-lever over, he heard the hoarse whistle of the Express, and realizing that she might be down upon him before his engine had cleared the main-line, he grasped the sand-rod with one hand and the throttle-lever with the other, and pulled both wide open. The 75 gave a great puff, and, leaping into motion, darted onto the Siding. Not a second too soon either; for at that instant the Express came whizzing around the curve. Her appearance was followed by a sharp shriek of her whistle, then, with showers of sparks flying from her tightly-set driving-brakes, she bore down upon them like a thunder-bolt. For an instant it seemed that a collision was inevitable; but the fireman by a mighty effort succeeded in closing the switch ere the 75 had scarcely cleared the sliding-rail, and as the lever dropped from his hand, the Express flashed by.

In the cab of the engine pulling the Express sat Old Tom Brown, his white beard streaming over his shoulders; his right hand working the sand-rod, and his left, the air-brake. None knew what a close call he had from the grim destroyer, Death, better than he; but, with that coolness which characterizes his class, he whistled off brakes, and dashed on toward Driftwood.

Richard Brown is now Superintendent of Motive Power of one of the great railroad systems of the Northwest. His foster-parents have a home with him, and, as they sit by his fireside and enjoy the comforts that he has provided for them, they bless the day that they cast their bread upon the waters.

## THE SOLIDARITY OF ALL REFORMS.

BY JOSÉ GROS.

No. 2.

Most disagreements among men arise from ignorance on fundamental truth. All disagreements among reformers spring up from ignorance on the basic laws of social development. Our socialistic friends, the plural taxers, show that in every article they write. Every such article advances the single tax cause. Every one that attacks truth advances truth. The very contrast between truth and error makes truth brighter than ever. We do not care about converting any of our antagonistic friends. We are after the conversion of the silent men, the humble in heart and soul, the earnest in quiet thought. They are the ones that tell. They alone shall do good work in due time. We writers on either side, that of truth or that of error, what can we do but to evolve thought among the many? And those who write in favor of truth, what would they do if somebody should not write against truth? They would seldom have much to say.

And there is the beauty of this MAGAZINE, so masterly conducted by our common friend, Mr. Debs. Each number comes replete with thoughts clashing and re-clashing against each other, and so carrying the mind onward in search of higher and higher thoughts.

The complacency of our plural taxers is very instructive, and the boldness of their assertions extremely amusing. Take, for instance, the one that "in our country immense fortunes are accumulated by capitalists and corporations in which the value of the land used or owned is insignificant," and then we are referred to the Standard Oil Company, and others like it, as exemplifying the fact!

What is the object of any group of capitalists or any corporation, trusts and the like? To more or less control some branch of industry or commerce, some process of production or exchange. That requires tools, the tools require buildings, the latter require land. We have not yet learned how to erect buildings hanging on the skies. But because a magnificent building can be erected on a lot 50x100 feet, or even less, our friends imagine that mighty little land value is needed to be the owner of a big building. Where do our

friends live, I wonder; in the forest? They don't seem to have yet taken cognizance of the fact that there is an enormous difference between land and land values, and that very often a small city lot is worth as much as any 1,000 good sized farms. We refer, in both cases, to the naked land. On choice situations in our large cities magnificent buildings are often worth but 30 per cent of the land on which they stand.

And where do we find magnificent buildings, replete with costly tools? In the jungle? Could they there control any branch in production or commerce? Take that historical factory of Bro. Carnagie, near Pittsburgh. The 400 acres immediately attached to that establishment are worth \$2,000,000, if anything, and the same concern controls quantities of vacant and improved land around. And 36,000 acres of valuable land in the coke region are also controlled by that concern, in itself, or more or less connected with others of the same type; and each stockholder in that establishment or similar ones, is himself a good sized land-holder somewhere under the sun. It is funny that our good friends, the plural taxers, have not yet learned that, or refuse to learn it!

What is it that enables some men to place large sums under the control of somebody else? The fact that they own more wealth than they could control themselves. Can any of us control wealth, tools, without controlling land, the tool of all tools? How can that be done? Our friends never explain that. How can they? Just as well try to explain how the planets and the stars could hang and roll through space without the force of gravitation.

And what about the land values of the Standard Oil Company? Some of our friends are innocent enough to say that the wealth of the company rests on pipe lines and refineries. Just as if we could have refineries and pipe lines without land, and very valuable land, because very useful to a certain and important form of production! Besides, why is it that the Standard Oil Company has been able to freeze out most other oil companies? Because it has gradually taken possession of the most important belts of oil land in our fair country. The concern holds the bagatelle of 1,000,000—one million acres—of such land, worth to-day, perhaps \$200,000,000, and if not to-day later on, and not very much later, either.

Now let us see about the question of annual economic land values for this nation of ours, something that is constantly keeping our friends, the the plural taxers, on pins and needles. A certain humble, obscure single taxer has given us an estimate of such economic land values for 1892. The estimate is \$22,000,000,000 capitalized value, or, at 5 per cent., \$1,100,000,000 annual land value; the monopoly value about \$25,000,000,000, at 6 per cent. equal to about \$1,500,000,000 annual land value. The latter includes, as a matter of course, not only the actual rent paid by some to somebody else, rent *per se*, or interest on that part of each mortgage representing land value, but also the capitalized rent embodied in every purchase of land by the producer and from the speculator. Also the land rent

that each land-holder naturally and practically receives from the house and lot he lives in or does business in. For instance, if I live in a house and lot worth \$6,000, the lot worth \$3,000, I then add to my annual income \$600, half of that considered as land rent and half as interest on the house value, as that is what I would have to pay if the house and lot were not my own.

The very friends who kick and kick at the above estimate of our economic land values, or any other similar one, are especially careful never to mention any data showing that the estimate is not approximately correct. Worse than that. In the very article in which some of that kicking has recently been done, that article itself endorses the estimate in question. It is there stated what we all know to be true, viz.: that the annual land rents of Great Britain are not far from one-sixth of the national income, or about \$1,000,000,000. Our population is about two-thirds greater than that of Great Britain. That would make our monopoly land rents over \$1,500,000,000, certainly over \$1,000,000,000 annual economic land value. And that would not take into consideration the fact that land rents and land values are higher in the United States than in England, for the simple reason that population increases more rapidly among us than in Great Britain.

As the friends we are dealing with are apt to be skeptical about any truth they may not happen to fancy, we shall mention the fact that while the maximum price of land in London, the English metropolis, is not over \$10,000,000 per acre, in our own metropolis New York City, it is over \$15,000,000 per acre.

Anybody who has studied this question of economic land values knows that our franchise corporations alone hold not less than \$8,000,000,000 of such land values, and our syndicates and mining companies not less than \$3,000,000,000.

Now suppose that every idiot in New England can have a farm within sight of a factory for the trouble of taking possession of it, as we are told to be the case. Well, what about it? We don't consider that our 700,000,000 acres attached to farms are worth over \$2,000,000,000 economic land value, capitalized value. Suppose that we have made a mistake, and that they are worth nothing. Well, so much the better for every one of us. That would show that the farming communities can get along without public improvements, or that farmers don't want any such improvements, and prefer to live without the comforts of organized society. That should be their own look out. We can not eat the cake and have it.

Because, when our friends say that on such a place land has no value, they simply say that there is no need of any organized society on such a spot. When they say that such and such land has but a low value, that merely proves that only a very simple social organization is needed there, and so on to the end of the chapter.

Suppose for a moment 65,000,000 population, with plain, simple habits of life, living in nice little country towns over our choice climatic belts. They could run their national and local govern-

ments on \$200,000,000 total annual revenues, or even less. That would imply but \$4,000,000,000 capitalized land values. But imagine our 65,000,000 population bent upon living in sixty-five cities like that of New York. They would then need a national and local revenue of about \$5,000,000,000, and so \$100,000,000,000 capitalized land values. It is all a question of our own choice.

The writer can be exceedingly happy in a \$500 hut and a \$10 suit, if he only has three full, plain meals. Some can only be happy in a palace worth \$1,000,000,000, and when dressed in suits worth \$500. They are welcome to all that, if they can get it without robbing anybody. Why not? As it is the case with individuals, so it should be the case with nations. That is single tax doctrine when properly understood.

Our friends are fighting against the single tax of their own imagination. The real single tax—they don't know what it is, and we shall more fully prove that in future articles.

[To be Continued.]

---

## SHORT STUDIES IN POLITICAL ECONOMY.

BY WILFRED P. BORLAND.

### No. 7.

The two brothers, Tiberius and Caius Gracchus, who sacrificed their lives in the attempt to remedy the evils which were surely undermining the Roman State, were widely different from each other in temper and abilities. Tiberius was the older of the two by nine years and thus naturally came upon the scene of action first. To this fact Plutarch, in his "Lives," adverts as being one of the principal causes of the failure of their efforts. He says:

"One of the principal causes of the failure of their enterprises was this interval between their careers, and the want of combination of their efforts. The power they would have exercised, had they flourished both together, could scarcely have failed to overcome all resistance."

Caius was undoubtedly the abler of the two; he had a larger grasp of the real necessities of the situation, and was more methodical and comprehensive in his measures, than was Tiberius. In a word, he was more of a "statesman" than his brother. He also differed from his brother in his temper; he was hasty and passionate, so much so that often, in the midst of speaking, he was so carried away by his temper as to forget his entire argument and pass into mere abusive talking. To remedy this defect, as Plutarch tells us, he used to station an ingenious servant of his, whenever he was speaking, behind him with a pitchpipe, or instrument to regulate the voice by; the

servant, whenever he perceived his master giving way to his anger, would strike a soft note on the pipe, on hearing which, Caius immediately recovered his temper and quietly proceeded with his argument.

Tiberius was the direct opposite of his brother in this respect; his oratory was calm, gentle and persuasive, such as to awaken emotions of pity rather than anger. He possessed all the earnestness of Caius, but seems to have lacked the latter's ability and self-confidence; he recognized the fundamental evil, and proceeded straight to its correction, not hesitating to employ unconstitutional means, when necessary, for the passage of his measures; but the consequences of his measures, the "afterwards," he had not the ability to grapple with, and his life paid the forfeit.

The Sempronian agrarian law, which was enacted through the efforts of Tiberius Gracchus, was, in its main features, nothing more than a re-enactment of the Licinio-Sextian law, which had never been repealed. How the provision of the Licinian law, which prohibited any citizen from holding more than 500 *Jugera* of the public land, had been evaded, we are told by Plutarch in a way which strongly reminds us of 19th Century methods of dealing with such questions:

"The rich men of the neighborhood contrived to get these lands again into their possession, under other people's names, and at last would not stick to claim most of them publicly in their own."

Continuing the subject he says:

"The poor, who were thus deprived of their farms, were no longer either ready, as they had formerly been, to serve in war, or careful in the education of their children; insomuch that in a short time there were comparatively few freemen remaining in all Italy, which swarmed with workhouses full of foreign-born slaves."

The arrogant methods of the rich are also excellently described by the following passage from Mommsen:

"A peculiarly favorite method was to eject the wife and children of the farmer from the homestead, while he was in the field, and to bring him to compliance by means of the theory of "accomplished fact."

The agrarian law enacted by Tiberius' efforts provided for the resumption of all the state lands, held by any one person in excess of 500 *jugera*, and the cutting up of the land thus resumed into lots of 30 *jugera* in extent, which lots were to be distributed as inalienable heritable leaseholds, the holders to bind themselves to use the land in agriculture, and pay a small rent to the state.

Although the law proposed to indemnify former holders of this land for all their improvements, it nevertheless excited violent opposition, and the privileged classes threw every possible difficulty in the way of its execution. In order to secure the passage of his law, Tiberius had been compelled to adopt the unconstitutional expedient of securing the deposition of one of his colleagues in the tribunal assembly, as a means of getting rid of his veto; he was now driven to adopt extra-legal means to secure the execution of the

law. The law provided for the appointment of three commissioners, who were to have charge of the proposed resumption and distribution of lands, and Tiberius secured the appointment of himself, his brother Caius, who was not yet twenty years old, and his father-in-law Appius Claudius, as such commissioners. A sort of a family arrangement by the way, which was highly displeasing to the aristocracy. At the very outset the commissioners found themselves confronted by the almost insuperable difficulty of determining which were truly state lands and which were not; the decision of such questions was, by existing law, lodged with the consuls and senate, and, believing that if these representatives of the aristocracy should be left to decide such matters his whole scheme of reform would be defeated, Tiberius secured the passage of a supplemental act empowering the commissioners to decide all questions of dispute arising under the main statute. This was so clearly an infringement of the constitutional prerogative of the senate that it aroused a storm of indignation; the popularity of Tiberius was somewhat shaken, and he received notice of the senate's intention to impeach him as soon as his term of office as tribune expired, so as to permit such a course.

In this emergency, Tiberius offered himself for re-election, and, in order to strengthen himself with the people, he gave notice of several further measures of reform, which he proposed to institute in the event of his election. Party strife ran high; and, when the day of the election came around, the nobles interdicted the voting with the legal objection that it was unlawful to elect a tribune as his own successor. Amid great confusion the assembly adjourned, to meet again on the following day; when the senator Scipio Nascia, who was the leader of the opposition, despairing of being able to defeat Tiberius by fair means, and failing to secure the consent of the consul Scaevola, to the apprehension of Tiberius as a breaker of the peace, called upon his adherents to follow him and rushed to the attack of the Gracchian party. Nascia and his followers armed themselves with clubs and falling upon the Gracchians, who were wholly unprepared for the onset, they beat Tiberius to death along with three hundred of his followers. The bodies were taken up and cast into the Tiber.

Thus perished Tiberius Gracchus before the thirtieth year of his age, but his work could not be disposed of so easily.

The aristocracy did not dare to attempt the nullification of the agrarian law immediately, and were obliged to stand by and see the distribution of lands go on unchecked. Three years after the death of Tiberius, Scipio Aemilianus, a brother-in-law to Tiberius, came upon the scene as the champion of the party which opposed the further distribution of lands. He secured the repeal of the act which empowered the commissioners to settle disputes as to the boundaries of the state lands; and placed such power with the consuls, where it legally belonged. This, of course, had the effect to nullify the efforts of the commission and the distribution of lands came to an

end. The wrath of the popular party was now visited upon the head of Scipio, and he was assassinated in his bed.

The aristocrats now gained the upper hand for a time, chiefly because of the lack of competent leaders among the populares. Young Caius Gracchus was sent away into Spain; the distribution of lands came to an end; but the aristocrats did not yet dare to interfere with the distributions already made. In the year 123 B. C., nine years after his brother's death, Caius Gracchus returned from Spain and was elected tribune of the people. In his estimate of the character of Caius Gracchus, Mommsen says:

"By virtue of this fearful vehemence of temperament he became the foremost orator that Rome ever had; without it, we should probably have been able to reckon him among the first statesmen of all times."

The new tribune had a comprehensive and well matured plan for the ruin of the aristocracy and the relief of the people, but before proceeding to its execution he went systematically to work to remove some of the stumbling blocks which had caused his brother's downfall. His first step was to secure a law permitting a tribune of the people to solicit re-election for the following year. He next introduced the distributions of corn in the capital which in the days of the Empire became such a power in the hands of demagogues. The object of this was to attract the free proletariat to the capital and create a following which could be depended on to uphold him in his battle with the senate. He next introduced some changes in the order of voting, designed to insure to his following a majority in the comitia. He then proceeded to reinvest the commissioners of Tiberius with the power they had been sheared of, and had the provisions of the Licinian law extended to the provinces. He reformed the tax system of the provinces, particularly of Asia, and projected some vast transmarine colonization schemes which were totally at variance with all the precedents of the state.

Caius offered himself for re-election, and was given the tribunate for the second time by an immense majority. His energy seemed tireless; he personally attended to the execution of his laws, presided over the distributions of grain, set out boundaries, gave his personal direction to the colonies he had projected; he sought in every way to render himself indispensable to the state, while reducing the senate to a body of nonentities. The aristocracy, perceiving that their only salvation lay in the downfall of Gracchus, and finding themselves unable to cope with his wonderfully energetic measures, suborned one of the tribunes, Marcus Livius Drusus, to play the demagogue against him. Whatever Gracchus proposed, Drusus proposed something yet more radical, and the latter took care to let it be known that his measures had the sanction of the senate. The beginning of the end was now at hand; the fickle multitude was easily induced to transfer its allegiance from Gracchus to Drusus and play into the hands of the party that sought to smite it.

Near the end of Gracchus' second term, and while he was absent superintending the establishment of a colony upon the site of

ruined Carthage, Drusus proposed to remove all restrictions from the lands distributed by Gracchus, and confer them as absolutely free property. The bait took; Gracchus failed of re-election, and at the same time his deadly enemy, Lucius Opimius, gained the consular election. It was at once sought to put a stop to the founding of the colony of Panonia upon the site of ruined Carthage, which work Caius was then engaged in. Caius gathered a body of his adherents and proceeded to the assembly with the hope of being able to defeat his enemies in the voting. While there, one of Caius' followers got into an altercation with a servant of Opimius and killed him. The wildest confusion immediately followed; Caius, attempting to speak, was declared to be guilty of interrupting a tribune of the people; he was hurried away by his followers and a price was set on his head. Civil war broke out in the city; more than three thousand persons were killed; Caius was murdered by one of his slaves, who afterwards killed himself upon his master's body.

Thus ended the last really serious and well organized attempt to reform the evils in the Roman state. The nullification of the Gracchian law was only a question of time with the aristocracy; the first step was to render the distributed lands alienable and private property, thus paving the way for their re-absorption by the rich. One by one the old conditions re-appeared and Rome pursued her ignominious course through the bloody conscriptions of Sulla, the ambitious wars of Pompey and Cæsar, the licentious and bloody excesses of Caligula, Nero and Domitian, to an inglorious end. In the words of Pliny: "*Latifundia perdidere Italiam.*"

## "KISS ME, DARLING."

---

BY FRANK A. MYERS.

No. 1.

The long hours of the dread night that cast fell shadows over the town and over all the earth, and that begot in some queer, mystical way a touch of nameless fear in the heart of Tol Vernon, and that aroused a feeling of shrinking away into some secure spot from the pitiless gloom and darkness up and out and everywhere around wore slowly enough away, indeed; but Tol, fresh, exultant, hopeful, ready to undertake the removal of mountains if need be, passed the night much as usual in his chair at the telegraph operator's table in a railroad station office. Tol had been reading a story of the Elzevir library edition, and was deeply absorbed in it, but the calls over the line frequently interrupted him. But each time he picked up the paper-back volume and poured over it again with un-

divided attention. His coal oil lamp flue was smutty and black, and though the lamp sat close at his elbow it cast a pale, sickly light upon his printed page.

"O, such a light!" he ejaculated, throwing his leg off the arm of the chair, and swinging around to the lamp which he seized and shook vigorously, much as a dog does a snake when he worries the life out of it. "The blasted thing is trying not only my patience but my eyes as well. The railroad company is too measly poor and dead broke to afford a good lamp for a man who has to wear his life out through the weary watches of the night." He turned to the alluring page again, pulled his felt hat a little lower over his eyes to shade them better, and set his feet high on the little cannon stove that had but little fire in it through that soft, pleasant night. "I want to see how this thing comes out," he muttered to himself, and was lost again in the bewitching tale. Now, I'm not going to tell you, dear reader, what he was buried in, or you will most likely want to read the same alluring story. Indeed I will boldly confess I have not read it myself, but I am perfectly satisfied that whatever caught the emotions and undivided attention of Tol was a most engrossing and all-absorbing book. The title is perfectly familiar to me, and it is no wonder that he wanted to read this tale of love and sorrow and of final happiness. Doubtless had you been reading the book by such a light you would have ruthlessly shaken it, too.

"Hang it! I swow I don't want this pretty girl to marry that dark-browed villain; but I believe now he will win her heart and hand in spite of herself. It seems so." And again he was lost in the tale. He was so absorbed that he did not notice that he almost pushed the stove over when he dropped his feet heavily to the floor with a dull resounding echo, as he turned to the instrument in answer to a call. He responded, and then came the intelligence:

"Train No. 4 on time."

"All right," he said to himself, and glancing up at the dial of the clock saw that he had quite a good deal of time left yet in which to read before the train would arrive. In order to be sure of all things and to know that he had neglected nothing and had done his duty faithfully, he seized his round globe lantern and sauntered out upon the platform and gazed up and down the track. All was as still as death around. Nothing was stirring in the town, which lay silent and dumb as a sleepy giant in the black night. Not a shadow was to be seen nor a sound heard up or down the track far or near. All was well. The two rails glimmered far away under the light of his lantern, and looked like monster threads of fire spun by some demoniacal, hideous spider of the fear-exciting night. Tol swung his lantern back and forth a few times in an absent-minded manner, his thoughts dwelling on the folly of the pretty girl about to marry he villain, and then stalked back into the dingy office to find out more of the fate fortune held in store for that hapless girl.

"I do think the girl is a sorry fool if she marries that black-hearted villain. I don't see why she can't see what he is. It's as plain as

daylight. But love is blind they say. It's a shame if she marries him, that's all. Confound him! I want to kill him."

Placing his lantern near the door he dropped heavily into his chair, snatched up the book like an angry man, and throwing it open with a vexed air resumed reading where he had left off. It was a matter of no little interest to him to know that the heroine was honorably and fairly treated, and in his every-day walk if he found a young lady mistreated, no matter who she was—stranger or friend—he became at once her champion and defender. It was a part of his constitutional make-up to feel a divine sense of respect and love for the fair sex—the most lovely portion of the human race. He was not a meddler in female affairs, but when open insult was offered a lady he at once became her protector. Of a practical turn of mind, quick to penetrate situations, spirited in action, courteous, as a rule, in manner and word, a young man of more than ordinary tact and business endowments, in the halo of a bright, fresh and beautiful young life, there were all possibilities and promises for him.

He was a handsome young man, the center of a circle of friends, and he was always neat in dress and appearance. In his dark, penetrating eyes could be seen a vividness and persistency of purpose that made the observer feel he would pursue to the end whatever he undertook. His lips met in the manner of classical or sculptured lips, and while they did not reflect the force of spirit that the full, gladsome eyes did, yet they were in perfect harmony with the spirit that animated his person. In his early life-tinted cheeks was written manly beauty and strength and health, and in his rather prominent square chin you noted masculine power and unflinching purpose. While his nose was not as pronounced as the reputed nose of St. Peter, still he had a nose that gave dignity and completeness to the ensemble of his countenance. His ears were small and lay close to his head, and with his black hair cropped quite short, as was his custom, he found it very difficult to retain a pencil above this organ of his facial or cranial anatomy. Some way the ear lay too close to the head and pressed the pencil out and off itself. Of splendid physique and athletic mould, it may be confessed he was not a little proud of his person. It would not be literally true to say that he was vain of these splendid gifts of heredity, but he was an admirer—let it be noted, a proper admirer—of his fine physical endowments. Looking at him as he sat in his office chair reading this rather overwrought love tale, you could not help admiring his superabundance of physical life as well as the intellectuality foreshadowed in the fine contour of his manly face. Just at present his admirable brow was completely hidden by his hat, which he wore as a sort of protection to his eyes from the sight-wounding light. The course or deeds of other people was a matter of little concern to him, for he himself was controlled largely by sound precepts imbedded as mudsills, so to speak, in his mental constitution by proper family training early in life. Upon the whole he was truly glad he was the boy he was, and that he was not some other fellow. In his heart, deep

down, there was a respect for family, and a feeling that there was nothing good in life which he might not attempt and attain, no pursuit in which he might not win a name and success, no profession in which he might not achieve permanent distinction. And if he had been called upon to give his reasons for choosing the work of a railroad telegraph operator, it would have been hard for him to find words for the motives that urged him into this pursuit. He had in some way when a small boy, adopted or begot a fancy or a liking for the clicking sound of the brass key—if the telegraph instrument may be so called—and here he was, now, in the beginning of real manhood, at the threshold of a wider existence, fairly established in the harness of an "operator." When a mere lad he remembered seeing a man pressing up and down the key to the "instrument," and he thought it wonderful, and from that day on his resolution to be an "operator" was watered and grew into a grand reality.

A night operator, and in the tentative stages of his practical life-work, he was afforded abundance of time to read, and his reading took rather a wide and careless range, embracing a little poetry, some politics, the daily press, a few novels, travels, biographies, and much descriptive and illustrated writing. He was, therefore, prepared with a practical and sensible opinion on almost any current topic. Tol Vernon was anything but an idler or a flippant jester, nor was he given to foolish vagaries and smart Alex ideas. Tol was a young man you would like and like very much, I am fully persuaded, and if you could see him in his office chair in that small and dingy little room, a deeply intent look characterizing his strong face, I have no hesitancy in saying you would want to cultivate a closer acquaintance with him. You would want him for your friend at once. There is something subtle in the nature of everyone which cannot be exactly defined, but which in some inexpressible way reveals a heart that we would like to know better, or else one we desire not to know further, just as the case might be. Tol's nature was so broad and liberal that it seldom was out of harmony with anybody.

"O, pshaw! I do believe this painted beauty is in love with that vainglorious villain. 'And the villain still pursued her.' There is more truth in that in this case than jest. I hope the writer will bring this double-dyed villain to his just deserts before the girl—poor thing!—gets too far 'gone' on him."

He pushed back his hat an instant, rubbed his hand back and forth across his forehead a time or two, stared hard at the burning lantern a moment, and, pulling down his hat again, resumed reading. All this was done in thoughtless abstraction. All things then were bright and glorious for Tol. Pity we cannot see an inch before our noses!

The office, like all such small depots or small station houses, was a coal-begrimed, dark, dingy one, a sort of stingy middle space between the waiting room and the freight room. A small window with angles sat out like a bay window, and in this abnormal window the operator sat so that he was enabled to see up and down the track

without arising from his seat. But the darkness of night shut off the view, and so a lantern became a useful thing to the night operator. In this window, at the height of a table, was arranged a shelving that was meant to serve as a desk for writing and for the use of the instrument. A broad platform partly covered by a projecting roof was between this window and the track. The platform was for the benefit of the people who got on and off trains, as well as for the needs of freight and freight handlers. An ink-bedaubed ink-well, a few old pen holders, a lot of useless sheets of scribbled paper, a pad or two of telegraph blanks, and other such things as generally lay negligently upon an operator's desk were on Tol's table. The instrument that early in the night kept up a constant, irregular knocking and sounding, now at this hour of the morning was in a dozing attitude, and only now and then took fitful starts and chattered noisily upon the fretful silence for a minute or two. The little ticket cabinet was locked against the wall; the express and freight books were under the lid of a small desk that seemed to be ready to tumble from its rickety position against the wall; the art gallery seemed awry, for the advertising and other pictures gathered here and there at different times were in a graceful state of neglect, and were sooty and hanging on one corner only, and many just ready to fall; the spirit of its fresh, artistic life, had long ago receded into the musty past. The little lunch basket on one end of the desk had a corner of the napkin peeping out from beneath the lid, which gave it an untidy appearance. The old coal box at the side of the stove was in the seventh stage of its existence, and just ready to tumble to ruin. The old fire-cracked cannon stove stood ankle deep in bits of coal, gravel, sweepings, and cigar stubs, and to look upon it made you feel that you wanted to rail out at its beastly appearance. But Tol was not the purchasing agent of the railroad company, and so he had to accept and put up with such conveniences as the "soulless corporation" permitted him to have. Tol never saw the black, smutty ceiling above, and the irregular, well-worn, shamefully dirty floor did not add one single pang to his soul. He was a night-hawk, and these cruel defects did not concern him, for daylight alone cast reproach upon them, and he and daylight were not very intimate friends.

This station house, or depot, as we plain western people prefer to call it, was at a spirited town on the line of the E. & T. H. railroad, and for the present we will call the town Curtis. It is almost impossible to say this much without at once disclosing to everybody just which town it is. The good people of Curtis will at least remember the whole circumstance as related herein. This story was a nine day's talk with them at the time.

Again the instrument called Tol from his novel, and he put the book down with reluctance. The intelligence was—

"Train No. 4 on time."

This time the notice came from the last operator on the road, awake at that hour, before the train would reach Curtis."

"Well,"—half petulantly because of his interruption, and half pleased that all was right down the road—"I think the E. & T. H. very fortunate that so few accidents happen." Then he turned to the key, and calling "K," the one who had sent the message about No. 4, asked him—

"Are you sleepy?"

"No," came back with a sleepy drawl, which brought a smile to Tol's face. "I think I'll fast forty days without any sleep," added "K," "and beat Dr. Tanner."

"Ha! ha! That's an idea," sounded Tol back.

"I always have ideas."

"I never knew you were accused of that before, but I knew you had the jim-jams sometimes," replied Tol, playfully.

"Go to—thou sluggard! You mutter in your dreams!" replied "K," with a snap, and closed the instrument.

Tol caught up his lantern near the self-locking door, and went out upon the platform once again. Alone, lighted only by a dim lantern, the brooding, still darkness around spoke in unknown accents to him. He realized that he was in the center of a globe of light that diminished in intensity of brightness as the circumference receded from him. It was always a strange sensation to him to pause in the solemn stillness around, made fearful by the pressing pall of Nox, and listen to the rush of his own heart-blood and almost feel the sands in the hour-glass of life falling into the everlasting eternity of the past. In the warp and woof of his being there was a little color of poetic sentiment, and the death-like stillness enveloping him developed sensations in his heart that he could find no words to give utterance to. After reflecting a few minutes upon the wonderful mystery of life, his mind reverted to the story he had just been reading, and he again broke out in a soliloquy:

"I really don't want Rose to marry that beastly Baneful. I'd rather she'd understand Tannver and marry him. He's the man *for* her. If she could only see! But there it is! She persists in *not* seeing, even when everything points to the plain facts in the case. Let me see, I have twenty minutes to read yet before No. 4's arrival."

And back into the office he strode with rather animated step. Most people would say, in ordinary talk, that "he shot into the office like a dart." This common national fault of exaggeration—which is only a polite word for lying—cannot be relied on in this particular instance. Tol simply moved briskly back into the office, again placed his lantern near the door, and half flinging himself into the chair began to read where he had left off the story of Rose and Baneful and Tannver. He was now more than three-fourths of the way through this ordinary sized love tale, and he hoped to finish it before he quit the office.

[To be Continued.]

## THE SINGLE TAX.

BY WILLIAM MANNING.

If I rightly understand the position of single taxers, it is that there is an unearned increment flowing from the use of land, which goes to the land owner in the form of rent, if the land be used or occupied by other than the owner, and if used or occupied by the owner then this unearned increment goes directly to him. This is the theory of Henry George, as set forth in his "Progress of Poverty." George maintains the theory that land is common property; and, inasmuch as its use or occupancy affords something which he styles "unearned increment," it too is common property; hence it should be appropriated to public use by a tax upon land values equal to the amount of such increment. The value of this unearned increment, he claims, is measured by the rent exacted for the use of land.

Several years ago I made an offer—and it is still open—to give any single taxer, who maintains that there is something flowing from the land which is not earned, the use of forty acres upon this condition: He must take the land in its natural condition and improve it just as I have and keep an accurate account of the cost of improvement, the labor of producing his crops and receipts from the sale of the same, amount paid in taxes and the value of natural fertility removed in crops sold; and if at the end of five years he can show that he has anything which he has not labored for, over and above decent wages and the ruling rate of interest on capital invested, including a sinking fund equal to the amount of depreciation in team and tools, I will execute to him a warrantee deed of the premises. If he fails to show that he got something for nothing, or this "unearned increment," he must vacate the premises, I paying for the improvements less the value of natural fertility removed during his occupancy.

I am one who agrees with Henry George, that this world belongs to the inhabitants thereof, share and share alike; and when the time comes, if it is during my sojourn here, I am willing to divide up, only claiming value for what I relinquish. But I will never consent to be taxed on the use of land, as that is the only thing of value to me; it is only through use that I can find employment for my labor and capital. What is a farmer but a hewer of wood and a drawer of water for the balance of society? The bootblack is accorded the right to fix a price for his services; not so the farmer; he takes just what society pleases to pay him, and pays for the services of others just what they demand. Does not any sentiment being known that so long as a user of land is denied the right to fix a price upon the product of his labor, he cannot include his myth called "unearned increment" in the price of the same? Some visionary sky scraper who, like Mr. Borland, believes that the "dismal science" is an exact one, will thrash my argument into smithereens by quoting the old

fad about supply and demand coming to the farmer's aid. I know full well that if conditions of production and distribution were subject to the law of competition, the law of supply and demand might operate to do justice to the farmer. But when we know that almost every line of production is in the hands of a trust, whose sole reason for existence is to destroy competition and that the same is true of the agencies of distribution, it is not nonsense to talk about the law of supply and demand regulating the value of products and services? Again, I insist that no one but a man who will not see the truth will hold that the user of land desires a bonus from such use. "In the sweat of thy face shalt thou eat bread;" thus said the Lord to the first farmer. "Thorns and thistles shall it bring forth to thee." For forty-five years, as boy and man, I have found the thorns and thistles, but no "unearned increment." Now, in order to give the single taxers every advantage, I will admit that the law of supply and demand is in full operation; what effect does it have as a regulator of the prices of products? It compels obedience to the law of cost of production. To illustrate: A peanut vendor sets up in business on a street corner; having no competitor it only takes one to make a bargain, and he is that one. Having, and insisting upon, the right to fix a price upon his product, he will be certain to exact an "unearned increment" over and above the average profit of other business conducted under competition. Capital always seeks investment in a business which pays an average profit; it flies into a project which promises more than average profits, and our peanut vendor soon finds himself confronted with a competitor on the other corner of the street; the supply of peanuts is doubled, while the demand remains the same. We know, from observation, that in order to retain his customers the vendor first in business must cut prices, and vendor No. 2, in order to divide the trade and invite and secure custom, must cut prices a little deeper. This process will be kept up until the profits of the business are sheared of George's "unearned increment." Competition will, sooner or later, work out its mission, which is, as stated, to compel disobedience to cost of production. Hence the profits of one business cannot long remain in excess of the profits of business generally. When competition is destroyed by combination the law of supply and demand is suspended, and has very little to do in fixing prices. Now back to the farmer. He is confronted with the world's competition; combination in his business is out of the question, he is by far too numerous; cost is all he gets, and he would be only too glad to enter into a contract with society to furnish his products at cost, and let Mr. Borland or Henry George estimate its amount. They surely would give us farmers wages, and reasonable interest upon invested capital. In my next I will discuss the question of rent; surely this is "unearned increment;" we shall see.

---

## DEAD MEN'S BRAINS.

BY THOMAS PRAY, JR.

Not an entertaining title, did some one say? So of many of the realities of life and its work; they may not seem entertaining because men, as a rule, *do not think*.

But to the man who does think and reason, and who does these two things from observation, there is nothing that escapes; and, from habits of reading and thinking, and going over the same ground again and again, new combinations are produced and results obtained that, if not clearly invention, certainly border on its boundaries, and enables the one making them to see far clearer than the superficial observer who is usually, like the swimmer on the surface, satisfied with display of his accomplishments and of attracting the most attention that is possible. But how is it with the man who seeks pearls?

He comes to the surface very quietly, takes in a long breath; and, unobserved, sinks again and again to the very bottom; making no noise; seeking only pearls, not attention, and bringing up to the surface, pearls of value, quietly but surely. So it is with the man who has no attraction to the places of amusement, or worse, but who turns to sources of information and seeks pearls of usefulness, of real value, which are available in all the works of life.

Years, now long ago, the writer, as a boy, was interested in some small but heavy trunks, the property of an old gentleman who, when asked what made them so heavy, answered, "dead men's brains."

Afterwards it came to be seen that, while the old gent was truthful in his answer to our youthful query, he also had an idea of stimulating our curiosity; and, in after days, he was an interested observer of our attention to some of the oldest of the records in Cicero, Pliny, Homer and Demosthenes, and occasionally he would ask "which of all the brains we preferred?"

So if the reader of this has some particular bent he or she would gratify, and it is not possible to waste four years at college in learning everything but what you were sent to learn, then it is easy, now, to procure, in reliable form, the best of the writings of those who have written carefully, if from ambitious motives, and who have left behind them the most valuable of all that has ever been put in our reach on subjects of vital importance. And it is no excuse, now-a-days, for any one to claim that one cannot get at least a good education, in any branch of knowledge, because he or she is unable to meet the expenses of a collegiate education. That day has gone, let us hope never to return. Most particularly is this true of the studies on mathematics and its kindred branches; for text books are now so plentiful that it is, at times, difficult to say to an inquirer which is the best of the number.

It is the love of good books that first made many a man eminent in his line of study. Commencing with a wish for the power to understand the things of which he read; looking at it that whoever would write must first be familiar with the subject; and then, to keep on with the higher knowledge, he who had already made some progress in a subject must keep on going higher and higher in order to fully understand the whole, has led on many a man or woman to a real love of the instructive, the entertaining, and the noble of life, from what was, at first, tedious if not distasteful.

And so it is with habit; if a man or woman is pure in thought it is easy to interest them in that which is ennobling, pure, and good; and, as they become more familiar with the subject, or more engrossed in it, they are forming habits and tastes for that which may not make one rich, but which does make one better; and, when once founded, these habits and tastes will grow in strength until the end will come only with the step of the vital functions and close of life.

"But it is so hard," and a hundred other complaints from those who have never done any one thing on their own account. Excuses! Poor workmen and good tools! But now and then we find one who turns away from the old ways and attaches for life to the new; and if any one uses but ordinary intelligence it is easier to be something than nothing; but too many of the number prefer to be nothing and attain the depth of their ambition, fully, and to their shame.

Men or women who have any ambition to succeed in some one or the many vocations or professions have the matter in their own hands. A man can do his day's work, and then spend one hour in serious study each day; in a few months he can master Cæsar, *if he will*, or he can, in the same way, clearly master Pascal; in any one of the several directions he may choose to go he may thoroughly familiarize himself with the subject. It is easy to find help, in any place, for the little aid needed when fitted to understand the primary or secondary grade of the subject; and, if the habit is once formed, it is only the time required to carry it out that is lacking, or to be filled in. Money or birth cannot and will not do the learning, nor fit the brain or hands to do the tasks or to teach from any aristocracy of person. It is a free road; it has many rocky places; there are brambles at the entrance of the path; but farther on there is the clearest of views, the most balmy atmosphere, and all of that which goes to make up the pleasantest of places or paths; from which point, when attained, it is a glorious view in any direction. And the curious thing in the view from this observation point, is that no one of the many who have attained it have ever been known to look away with any feeling of exultation.

It is perhaps not easy to understand this, but it is true that as those who have attained eminence reach such points in their career, instead of becoming pompous they are, without exception, more unassuming and less positive in their contact with their fellow men; and any exception to this that any one may call to mind, in which

assumption has been noticed, will on further consideration be found to be without the full attainment of the knowledge, not an exception to the rule.

Men who have had, or made opportunity to reach some position from which they look back, do not do so with any feeling of superiority in the simple attainment of that position; and, having travelled the way for themselves, they are the ones who do so much, in most cases, to aid those who have not even their own meager advantages, and who try to put education in the ready reach of those who cannot pay for it at all. And proof of this exists in many of the universities in the United States to-day, where a man or woman who can take care of themselves can, for a very few dollars, get a year's course under the best teachers that money can obtain, with all the advantages of libraries and apparatus that cost hundreds of thousands of dollars; and yet the tuition is only ten or twenty dollars for a course of forty or more weeks, or not as much as many a mechanic or other day laborer gets each Saturday for his weekly stipend.

Many of these very men are now saving money to give their sons such a course, but how many are spending more each month for drink than would be needed to send one or two of their sons or daughters, for a whole year, to such a place? And yet the very men who drink are the ones who curse, in roundest terms, the men who have accumulated great wealth by most assiduous attention to business, and to their own health, and who have no time to spend in the bar-room, at the gambling table, or in worse places.

Have you ever read of the splendid gift of Phil Armour to the city of Chicago, for the benefit of the young who desire a technical education—costing more than most men ever own—free, almost, to those who desire to attend. But what of the man who did this?

He is hard at work and is at his packing house at 7 o'clock in the morning, and so knows who is on hand, then at his other places, and at 10 a. m., at his offices; but he doesn't get time to run into the saloon, and he doesn't stay out all night, but when his day's work is over he gets to his home; and, no matter who calls or what it is for, at 9:30 p. m. he excuses himself and retires. This is simple; it regards his health; and it fits him to take up affairs involving millions with a clear head. And it seems that, in his own way, he has had time to dream out the scheme of the technical school, to build, fit, and then give it for the ones he wishes to have educational advantages which were denied to him in his youth. And all as free as the air that surrounds it; paid for and capable of going on many a year after his own hands shall have been crossed on his breast, over a still heart but a noble one, and one imbued with the highest motives for the benefit of those not so fortunate in the race for the world's prosperity as himself. Much more could be said of this man; he has a way of rewarding those in his employment, if they are faithful, sometimes it takes the form of a house and lot, a year's vacation, a course in college, or some other very practical reward determined by the needs of the one on whom it is conferred.

See the Pratt Institute in Brooklyn, N. Y.;—fully as noble was this to his class of young people, and it was finished before his sudden death—It is financially self-sustaining and is doing a power in the world in the way of aiding those who prefer to look up “dead men’s brains, and fit themselves for what is to come to them after fitting. But in all these places it is requisite that the person who is to be educated must fit, to some extent, before it is possible to enter; and it is the object of this article to suggest to those, who are so far from their ambition, that it is easy to attain the object if they will only be courageous and practice self-denial; study instead of throwing away time; study what is of the practical; leave off novels and “blood and thunder” ten cent trash and strike out boldly as if in the river and obliged to swim for life; put so far behind you the old that the new shall be ever beyond, just a little, to stimulate you to higher and more persistent, if well directed efforts.

The road is wide; but it is sure, if you tread it. If rocky, you need not be bruised, and if steep at first, you will acquire strength; and, if determined, you, as well as others, may rise to the heights and enjoy the view. But only after you have proved yourself worthy to enjoy it as the reward of your own efforts.

---

## THE SUPREME JUDGES.

---

BY GEORGE WILSON.

---

Probably the last place that you would look for a friend or sympathizer would be in the ranks of the bankers. Yet there are some persons in the world who are for right because it is right, and who do not think that necessarily right, which seems to promise them the most power or money. The events of to-day are rapidly crowding us into a radical change of our institutions. Like the earth that, in its revolutions, carries us all along with it, whether we want to go or not, so these changes in human affairs get a start and we have to go whether it suits or not. Man’s natural conservatism makes him willing to let things alone as they are until the force of circumstances makes him change them. As Jefferson said in the immortal Declaration of Independence: Experience has shown that men are willing to bear great evils rather than change the form of the governments to which they are accustomed. Before the late decisions in the Ann Arbor strikes I wrote to a fellow-worker in the cause, that the first step necessary in the abolition of this second form of slavery, this slavery that capital by dishonest manipulation has put the people into, is a change of the constitution so as to elect the supreme court by a direct vote of the people. The legislatures and courts have got

things just to suit the one class, the class that enslaves. They have got things so arranged that the one class can combine and put wages at what they want to, can make any man a fugitive and a vagabond on the face of the earth, who can not get work anywhere unless he has done exactly as they have wished him to in his last situation; but when the employed want equal rights, to combine for their own benefit, the courts step in and prevent. Sometimes it is one excuse, and sometimes another, but in the language of the day, the court gets there all the same, the employer gets there all the same, and the employed gets left all the same. Now there is not a railroad company in this country but owes to the whole people its right to run at all. This right, which we have given them, they have used in a tyrannical and thievish manner to oppress their employes and to rob the people in general. The logical consequence is that the people ought to resume the rights that they entrusted these corporations with. But in all disputes the supreme court is our final master. It has shown that it is generally ready to make decisions in keeping with what it thinks best, not what the law is. Complete familiarity with the decisions in the banking and financial decisions has convinced me that the court will not decide according to the constitution but according to its own will. The intention of Mr. Cleveland, in appointing Judge Lamar, was to get a gold bug on the bench and protect the interests of the Frankfort Jew bankers, whose servant he is. The supreme court is the final arbiter of all questions; it therefore ought to be nearest to the people. In fact, it is the farthest from them of any of the three branches of the government. The people choose electors, the electors choose a president and the president chooses the judges. They are too far away from the people. Let the people elect the judges.

---

## THE CONCENTRATION OF WEALTH.

---

BY GEORGE C. WARD.

### No. 2.

I concluded the initial article of this series with the following tabulated statement:

Net increase in wealth in 1890 . . . . .	\$2,300,000,000
Interest charge so invested as to form a part of such net increase . . . . .	600,000,000
	<hr/>
	\$1,700,000,000
Less portion retained by labor . . . . .	80,000,000
	<hr/>
Residue to be accounted for . . . . .	\$1,620,000,000

I placed the gross interest charge with which productive and distributive labor was burdened in 1890, at \$1,260,000,000, and am even doubtful if that vast sum represents the total extortions of that God accursed and humanity cursing factor—usury or interest.

We now arrive at a consideration of the amount absorbed by the factor, profit.

The true economic definition of legitimate profit is *wages*. All income realized above fair wages for all those actively engaged in productive and distributive industries should, perhaps, be classified as interest, but for the purposes of this series of articles, I choose to use the commonly accepted limitation of the terms interest and profit, treating the "wages of superintendency," as a natural and necessary factor in the cost of production and distribution.

Legitimate profit does not rob labor, because it only secures "fair wages" to industrial managers or "exploiters" of labor. A full and exhaustive discussion of the various relationships to labor of the factor, profit would necessarily involve a consideration of the entire wage-working system, and would transcend the space allotted to this article. Hence I can only briefly point out some of the special features and divisions of the subject.

Profit not only appertains to the exploitation of labor in productive and distributive industries, or channels, under the wage-working system, but also inheres in the distribution of wealth, by storekeepers and sellers of goods, wares and commodities, even though the seller or storekeeper hires no help. If the profits received in such businesses do not aggregate more than the average wages realized by productive and distributive labor, it is clear that such storekeeper or seller robs no one, because he renders to society or the community valuable services and receives no more from the community than fair wages for the labor he performs.

Take a "boss" or employing carpenter, painter, blacksmith, printer, tinner or a small storekeeper who hires or does not hire one clerk or more, if such employer or storekeeper does not make more than a decent, comfortable living out of his business or employment, it is clear that he does no injustice to any one and robs no man. If the several employes of such men were to organize themselves into co-operative firms or societies, and continue to prosecute their several occupations, the first thing they must do is to rent premises for the occupancy of the business and its materials and tools; next, they must buy material and tools; lastly, they must guarantee to one of their number proportionate average wages to pay him for his services as a "boss" or manager, to contract for jobs, collect bills, buy material, etc., etc. If they should start a co-operative store, they must rent or buy a location, lay in a stock of goods, hire a manager, clerks, etc., and pay all necessary expenses. So that, so far as the small businesses are concerned, nothing can be gained by dispensing with the boss or employer, except that more men might combine in a co-operative enterprise than work for any one employer or buy goods from any one store, and so a less number of bosses, employers and store

managers would suffice, and thus a saving could be effected in that direction, such saving being available as an increase to the wage fund, and to that extent increasing the wages of those who actually did the work, or making it possible for the co-operative store to sell more cheaply. The vast majority of our employing managers of productive, distributive and repairing or embellishing industries only manage, by dint of hard work, energy and prudence, to obtain a fairly decent and comfortable living and many thousands of them annually are pressed to the wall, fail in business and lose the small capital they had invested. Very few of them, if any, accumulate any wealth, and they are numbered with the 12,350,000 families, who own, upon the average, \$1,255 to each family, and not with the 250,000 families who possess upon the average, \$186,000 to each family. Rent, interest and the profit that robs the wage-worker, in like manner robs the great bulk of employers and small storekeepers. These men are not the robbers, but should be classified with the robbed, in which category they undoubtedly belong. Until the great middle class realizes and appreciates this fact, Labor can hardly hope to be emancipated from industrial serfdom.

Where then shall we look for the factor profit which robs labor? I will tell you. Look to the vast manufacturing establishments which after paying salaries to managers, heads of departments and foremen, after paying interest upon borrowed capital or bonded indebtedness, yet pay goodly dividends to a multiplicity of stockholders who, performing no labor about the establishment, yet hold shares of stock representing, in most cases, more than the actual value of the plant. Look in the direction of the forty-three listed trusts in the United States, with a gross capitalization of \$1,352,700,000, of which \$380,000,000 is water. And yet this list does not include some of the largest and most greedy trusts in the country, because no trustworthy information concerning their capitalization can be secured. Look in the direction of the street railway, water, gas and electric light companies and many other kinds of corporations, which are bonded for all or more than they cost, and yet pay, in addition to the interest on the bonds, good, fat dividends upon a capitalization as great in amount as the bonded indebtedness. These are the profits which rob and oppress all productive and distributive labor and play an important part in the concentration of wealth in the hands of the few and the absorption of the total net annual increase in wealth. Then there are the telegraph, telephone and express companies which must not be forgotten. It is impossible to give more than an approximate statement of the profits extorted from the people by these trusts and corporations. It is estimated that the capitalization of telegraph, telephone and electric railways and electric lighting and supply companies is more than one billion dollars, the Western Union Telegraph company alone realizing net profits of \$7,312,725 in 1890.

It has always seemed to me that there was a vast amount of misconception extant relative to the amount of actual net profits realized by our large manufacturing and distributive industries. Much of

this misconception arises from the habit of counting interest paid upon borrowed capital, as profit, whereas it is a part of expenses. We hear many vague and indefinite rumors concerning vast and fabulous profits realized by our manufacturing industries, by virtue of the protection afforded by our present tariff, and yet I honestly believe that, were we to inaugurate a free trade policy, that most of our manufacturing industries would be forced to the wall, unless at the same time we, in some manner, contrived to lower the current, prevalent rates of interest upon money.

The total value of all manufactures in the United States for the year 1890, was something approximating \$7,215,000,000, classified as follows:

Textiles . . . . .	\$560,000,000
Hardware . . . . .	970,000,000
Clothing . . . . .	490,000,000
Beer and spirits . . . . .	305,000,000
Leather . . . . .	520,000,000
All other manufactures . . . . .	4,370,000,000

The total capital invested was probably about \$3,800,000,000.

The state of Massachusetts is one of the leading states in the union in point of number and importance of manufacturing industries, being a close second to Pennsylvania, and the third state in the union as to capital invested and total product, New York being the first on the list. Massachusetts produces nearly one-eighth of the total output of manufactured goods in the United States.

What then of Massachusetts? *Hunt's Merchant's Magazine* of August 22d, 1891, contained an analytical criticism of the late report of the Massachusetts Bureau of Statistics of Labor, based upon the Massachusetts census of 1885, and the result of three or four years' continuous mathematical calculations.

From this I gather these facts: Ten thousand and thirteen establishments, having \$377,711,804 of capital invested and producing \$466,933,053 of goods, make a gross profit of 16.01 per cent. on the capital invested, above cost of production. This gross profit the bureau divides up as follows: "Depreciation of machinery, implements and tools, 10 per cent.—not 10 per cent. on capital or selling price but 10 per cent. on the value of such machinery; on the selling price this is only 1.9 per cent. For interest 5 per cent. on the amount of cash and credit capital employed, equal to 2.15 of the selling price; while for selling expenses, losses and bad debts 5 per cent of the selling price is the allowance in each case. Deducting these various items a net profit equal to only 3.90 per cent. of the selling price, or 4.83 on the amount of capital invested, remains. That is, after making proper allowances and deductions the manufacturing industries of Massachusetts as a whole show a net profit of not quite 5 per cent."

It then appears from the report "that the average investment of each of 12,558 partners in private firms in the 64 industries in the state from which returns have been drawn is only \$10,701, and that on this the net profit of 4.83 per cent. yields an income of only \$517. In other words, that is all the return a partner in a Massachusetts

private manufacturing concern gets for the \$10,701 invested, and for the time, labor and attention bestowed on his business. The average investment of stockholders in corporations is but \$7,857, which at 4.83 per cent. nets a return of \$379 per annum."

This makes an average of \$517 per partner and \$379 per stockholder, realized as net profit. But, as interest the partners who had cash invested average \$533 each in addition, making \$1,050, while the stockholders, or money lenders, get as interest \$392, making \$751 altogether. In the case of borrowed capital the money lenders get the interest instead of the partners, or stockholders. My readers will remember that, in the preceding article, I charged an item of four billions of dollars, at six per cent., as borrowed capital, represented by the bonds of street car, water-works, gas and electric light companies, breweries, trusts, syndicates, manufacturing industries, etc. I also charged up, as interest, the amount paid by the railroad corporations upon their bonded indebtedness.

I estimate then, as the net profits paid by the people of the United States, above fair wages for all those engaged in labor, either manual or of management or superintendency, the amount of \$385,000,000, tabulated as follows:

Dividends paid by railroad corporations in 1890 . . . . .	\$85,000,000
Net profit to all manufacturing industries, 5 per cent. on 4 billions	200,000,000
Dividends paid by street car, water-works, gas, electric light, express, telegraph and telephone companies and large mercantile establishments, etc., etc . . . . .	100,000,000
<b>Total . . . . .</b>	<b>\$385,000,000</b>

Here again it is difficult to estimate with any degree of exactitude, the portion of this gross sum of net profits, which is invested in such manner as to remain a part of the visible, material wealth of the nation and thus become a part of the "residual increment." Much of it goes abroad, principally to England, and is invested by or used in daily support of those who receive it in the country in which they live. Many of the stockholders etc., etc., in this country used their dividends and profits to procure a subsistence, having no other means of livelihood. Much of it is loaned out at interest and forms an addition, not to wealth, but to the burden of indebtedness. An extremely liberal estimate would be to place the amount becoming a part of the residual increment at \$250,000,000, but, in order to err on the side of liberality, I will place it at that figure. We now have:

Net increase in wealth in 1890 . . . . .	\$2,300,000,000
Retained by workers . . . . .	80,000,000
	<b>\$2,220,000,000</b>
Interest and profit so invested as to become part of net increase . . . . .	850,000,000
Residue to be accounted for . . . . .	<b>\$1,370,000,000</b>

In my next communication I will endeavor to show the manner in which the factor, rent, gobbles up this residue.

[To be continued.]

## SINGLE TAX FALLACIES.

BY W. H. STUART.

No. 6.

What is capital and how is it produced?

Capital is defined by Henry George as: "That part of wealth devoted to the production of more wealth," and interest as the "just return to capital for aiding production." He defines wages as: "Whatever is received as the result or reward for exertion." He further informs us that "in the politico-economic sense of the term wages there is no distinction as to the kind of labor, or as to whether the reward is received through an employer or not; but wages means the return received for the exertion of labor in contra-distinction to the return received from the use of capital and the return from the use of land."

Wealth, therefore, from the Georgian point of view, is property divided into rent of land, interest on capital and wages. The only change he proposes in the distribution of the product is that rent of land should be diverted from the pockets of the private land owner into the public treasury, i. e., rent of land is to be confiscated to the use of the community by means of the single tax.

The old economists defined capital as that part of wealth used for the production of an income without personal exertion. But our modern apologists for labor exploitation and shallow writers like George, euphemistically describe it as "Wealth used in assisting labor in production." So stated, the impression is left on the uncritical mind that the part performed by capital or the capitalist is a beneficent one, that of assisting labor or the laborer in production. No conception of the relation existing between the capitalist and the laborer could be more erroneous. Labor produces all wealth, and the capitalist—like the slave owner—merely appropriates it when produced. For, as Karl Marx says, "The essential difference between the various economic forms of society between, for instance, a society based on slave labor lies only in the mode in which this surplus labor is in each case extracted from the actual producer, the laborer." The slave owner did it by force, by the ownership of the slave. The capitalist accomplishes the same purpose by controlling the means and instruments of production; that is to say, a small proportion of the population owning all the mills, factories, and industrial establishments of all kinds, our railroads, telegraph and telephone systems, municipal gas and electric light plants, waterworks, our street railway systems, and by control of our financial system, all of which the capitalistic class has been enabled to acquire through a bad industrial system and through vicious legislation in the interest of their class.

This wealth the capitalists have no more produced than the land owners have produced the land, but, being in possession, they are

enabled to appropriate all wealth over and above a bare living to the actual producers. The laborers being divorced from the necessary tools to make their labor effective, are forced to sell their labor power for a part of the product, i. e., for wages, which under a competitive system is a bare subsistence.

This fully accounts for the present unequal distribution of wealth. By means of labor saving machinery, propelled by steam or electricity, by intensity of labor, by increase of technical skill, and by minute subdivisions of labor, the effectiveness of labor has probably increased one hundred fold within a century. Yet, destitution is the lot of the large majority of the actual wealth producers.

John Stuart Mill says in his principles of political economy: "It is questionable if all the mechanical inventions yet made have lightened the day's toil of any human being." Karl Marx accepts the statement, with the acute remark that Mill should have said "of any human being not fed by other people's labor," for without doubt machinery has greatly increased the number of well-to-do idlers."

The term capital is a modern one, and can only properly apply to our present system of capitalist production. Under the feudal system capital could not have been used for the purpose of exploiting labor, the necessary conditions for its use were absent. Production was for use and not—only in a very limited sense—for profit. But under present conditions wealth takes the form of the production of commodities for sale and not for the use of the producer. Buying and selling has, therefore, become a fine art.

The starting point of modern industry is the revolution in the instruments of labor, and this revolution assumes the most highly developed form in the organized system of machinery in a factory. Here, often under one roof and under one management are gathered, hundreds and perhaps thousands of employees who, no longer able to compete with the owner of the new tools of production are forced to sell their labor at the market price. Labor, itself, becomes a commodity, and instead of controlling the tools itself has made, they are made the means, in the hand of the capitalist, of controlling labor.

Nor can the term wages be used to denote the return to labor under conditions named by George, as for instance, "The hunter's wages is the game he kills." There is no analogy between the primitive hunter and the modern wage slave. There was no intermediary between the prehistoric hunter and his game. The game killed was his own; society had not yet differentiated into landowners, capitalists, and wage slaves. No capitalist or landlord stood by to claim the legs, wings and breast, while they generously allowed him to retain the giblets.

The supposed beneficent role played by capital (in the hands of capitalists) in aiding production reminds me of the little boy who remarked "that his mother was very good to him." "Every time," said he, "I take castor oil she gives me a nickle." "And what do you do with the money," he was asked. "Oh, mother buys more castor oil with it," he replied.

I shall offer as a more scientific definition of the term capital,

"Wealth devoted to the production of surplus value." By surplus value is meant all wealth over and above the actual subsistence of the laborer, and by laborer I mean all who in any capacity contribute towards the production of wealth.

Let me give an illustration of the production and exploitation of surplus value, and show at the same time how little the adoption of the single tax would interfere with the process.

Near this city (Los Angeles) is situated the Chino Beet Sugar Factory. The buildings and machinery cost about \$600,000. The land upon which the plant is situated cost about \$1,000. About 5,000 acres of land is used in the production of the beets. Nearly 1,000 men find employment in producing the beets and extracting the saccharine matter therefrom, and turning the product into refined sugar. The price paid for the beets averages \$4.00 per ton, or about one and a half cents per pound, for the sugar contained in the beets. The rent the laborer pays for the land represents a tax of about fifty cents a ton. The cost of extracting the sugar is supposed to be half a cent per pound, but we will say one cent per pound. The product is sold for five cents a pound; add the bounty of two cents per pound, and the amount received is seven cents per pound—a profit of  $4\frac{1}{2}$  cents per pound. It is the general belief that the profit for the first year paid the total cost of the plant. Of course this is only a surmise; the factory owners disclose nothing as to the profits made. In Germany this sugar is sold for  $2\frac{1}{2}$  to 3 cents per pound. I only mention these facts that there may be no question that the business is a profitable one. The factory is owned by a private company or corporation none of whom are employed on the premises. All the business transacted and work done, from that performed by the manager to the humblest employe is paid for out of the product, in wages. Now let us take stock. Here is land and the raw material, which enter into the composition of the buildings and machinery furnished free, by nature. But the finished buildings, the machinery ready to work, the beets and finished product, sugar is the result of human labor. Nowhere has the land owner or the capitalist, as such, contributed to this wealth.

Ah! but, some one exclaims, "The capitalist certainly furnished the capital for the purchase of the plant." Yes, certainly, but that capital was itself the product of labor, and in the hands of the capitalist merely represented accumulated unpaid labor.

For the sake of an illustration I shall use later I will assume that half the capital used in the construction of the plant has been borrowed, say \$300,000 at 7 per cent.

We are now ready to make sugar, and outside the factory stands a line of wagons laden with beets ready to be weighed. But here let us pause and ask what are the factors that enter into and decide the price paid for the beets at the factory. There are two. First, the cost or rent for the use of the land; second, the cost of the subsistence of the laborers. Surplus value has first to be extracted from labor before there is a fund from which rent of land or interest on money—defined as contract interest—can be paid. In other words,

the land owner and the money monger share in the product-surplus value.

At \$4.00 per ton the producer of the beets is enabled to pay the landowner's tax or tribute of fifty cents per ton, and the remaining \$350 provides him with the standard of living of his class.

With laborers plentiful, and one of the principal effects of our capitalist system of production, the constant displacement of the laborer by machinery, is to create a constantly increasing reserve army of unemployed. Under such conditions, competition among the unemployed will inevitably keep wages down to the subsistence point. No matter what the returns to capital are, no more than a bare subsistence, according to the average standard of living, need be paid as wages to the laborer.

To test this, let us assume that capital becomes so plentiful that its use can be obtained for its mere replacement, (one per cent. has been the current rate on good security in London, England, recently). The interest on the \$300,000 amounting to \$21,000, would be saved the capitalist owners of the factory. Would this affect or increase the price paid for the beets, or the wages of any employe in the factory? Certainly not. Labor would still receive its cost of subsistence. The saving effected in contract interest would merely increase the surplus value accruing to the original exploiters. The contract interest taker would be eliminated without effecting the share going as wages to labor.

Now let us suppose that the single tax has been adopted, immense areas of land are thrown open to labor, access to natural opportunities are open to all, and rent, in consequence, has been enormously reduced. All one has to do now is to stake out what land he can profitably use, pay the small annual rent or single tax, and go to work raising beets for Chino. For the sake of easy calculation, say that plenty of beet sugar land near Chino can be obtained free, the private landowner being eliminated, will wages increase? Well, let us return to the factory and see. Outside the factory stands another line of beet-laden wagons. As the first drives onto the scales he asks the price of beets, and is informed—what? \$4.00 per ton? Oh, no. The price is now \$3.50 per ton. Why? Well, the answer is easy. The producer no longer pays the landowners' tax of 50 cents per ton, and subsistence remaining at the same cost, he will be as well off at \$3.50 per ton as he was before at \$4.00 per ton.

We have now eliminated the landlord and the lender, and wages still remain at the cost of subsistence. Does any single taxer object to this statement and analysis of the production and distribution of surplus value? If so, I challenge him to show wherein I err, and let him at the same time, please inform us as to the way the single tax will increase wages. But I want reasons, not rhetoric or rhapsodies. The problem is, given the tools and instruments of production in the hands of a small class—and under individual ownership they must necessarily belong to a small minority—why should wages any more than now, exceed a bare subsistence?

And I here direct the reader's attention to the fact that the factory, with the machinery valued at \$600,000, used for the extraction of

saccharine matter from beets and surplus value from labor, will, under a single tax régime, go untaxed, on the ground that capital is a good thing, which should not be discouraged by being fined. Only on the rental value of the ground on which the factory stands will this plant contribute in any way towards the support of the Government, a sum probably less than \$50.00 per annum.

But we will return to the factory. At the end of the season the books are balanced. The balance sheet will show that after setting aside a fund for depreciation and insurance, or replacement of capital fund, an equalization fund, for distributing the losses that may accrue over a series of years, it is only after these are provided for that dividends are paid. But the balance sheet shows, after deducting those items, an amount of say \$100,000 is left as profit or surplus value.

Now, the question I ask is, who created this value, and to whom does it rightfully belong? If we accept Ricardo's and Adam Smith's theory of value, which socialists accept and build upon, and on which Karl Marx bases his theory of capitalist, production and exploitation of labor—a very imperfect presentation of which I made in the April number of this MAGAZINE—then labor, and labor only produced this value, and the exploitation theory of Robertus and Karl Marx is fully established.

It may be claimed that under free competition between sugar factories the profits will be reduced to the normal returns to capital. Yes, competition between capitalists does reduce their profits. The waste of competition is enormous, but it is to be noted that this competition merely wastes capital, it never raises wages.

But competition between capitalists is rapidly giving way to combination and co-operation in the production of surplus value. The communism of capital is practicably accomplished. Real competition is now mostly confined to that class more gifted with muscle than brains.

The function of the capitalist is to organize labor for the production of surplus value, which, when produced, he appropriates, and again uses in increasing his capital, i. e., surplus value. As a capitalist he produces nothing. He does not even require superior brains. The mere possession of wealth will enable him to obtain the use of that article at a moderate cost.

Therefore, an economic scheme, like the single tax, that would perpetuate this class of exploiters, and system of exploitation is unworthy the attention of intelligent American workingmen.

In a future article I shall endeavor to show what the real and only solution of the problem must be.

In the May MAGAZINE I gave an exposition of the socialist or exploitation theory of interest. In the June number Mr. Middleton expresses his disappointment at the analysis, which he evidently credits to the writer. This does me too much honor. For the analysis there presented I can only claim the arrangement of the words. The arguments are those of Karl Marx, a man of the most profound learning, whose work "Capital," marks an era as distinct in political economy as does the work of Darwin in Biology. Of this subtle

and epoch-making work Mr. Middleton, like George and all other single taxers, appears to be entirely ignorant. Mr. Middleton has no theory of interest. He does not even defend George's peculiar justification of it. He says if he borrows \$100 or 100 bushels of wheat for one year the six dollars or six bushels of wheat is interest for the use of the money or wheat for that time. He scornfully asks, "If I borrow a man's ship or house should I not pay for the use of it when I return it." Certainly he should, for in that case he pays for the wear and tear of the property. But what loss has the money sustained while in use. I think he, himself, must admit that the parallel is not exact. And the problem remains, why this interest is paid?

Prof. Macvane, whom he quotes, is as ignorant as himself as to this problem. Why should a man be paid for the use of his savings or why should interest be a reward for abstinence? From what did Jay Gould abstain that enabled so famous an abstainer to leave one hundred millions at his death? and that will enable his descendants to abstain from any further work (if they so choose) for the next ten thousand years, provided our present system continues. The abstinence and productive theories of interest are the arguments used by pseudo economists, and by superficial writers like George, in defense of capitalist exploitation. Mr. Middleton observes sententiously, "Either the use of a thing is worth something, or it is not." I am impelled to hint that this assertion is on a plane with the wise opinions of our old friend, Capt. Jack Bunsby. Mr. M. fears that to abolish interest under present conditions would plunge us into barbarism and starvation. By interest, Mr. M. means contract interest, or interest for the use of money. Why, my dear sir, they are within one per cent. of it now in London, England, and no more than the usual amount of starvation obtains, and that only among those who do not borrow at all. There hasn't a money loaner starved there for some time.

Mr. M. is deeply concerned in the loss that would accrue to the wage-workers who have their savings drawing interest in banks, etc. I strongly advise him to read carefully the article in the June MAGAZINE, by Mr. George C. Ward, under the caption, "The Concentration of Wealth." If he, at the same time, will recall the story of the small boy and the castor oil a flood of light will be thrown on the subject that will help to mitigate his grief for the poor workingmen. Mr. M. complains that I fail to make clear the relation of the single tax to the justice or injustice of interest. To which I reply, that a defense of interest as a just return to capital is part of George's economic scheme, and a criticism of his theories that left that out would be incomplete. Neither is Dr. McGlynn, or any other single taxer opposed to interest in the economic sense of the term. Dr. McGlynn is only opposed to contract interest, a form of interest that could be abolished without interfering, materially, with interest proper, i. e., surplus value, as I have shown, I think, in this article. Mr. M. credits me with the belief that our present industrial system is no improvement on preceding ones and that I regard the feudal system and the time preceding the age of steam as a much better period for

the laborer than the present, a sort of golden age. Well, I can retort on him that a writer whom single taxers are fond of quoting, when it serves their purpose, says:

"I have stated, more than once, that the fifteenth century and the first quarter of the sixteenth was the golden age of the English laborer, if we are to interpret the wages he earned by the cost of the necessities of life." (Prof. J. T. Rogers *Work and Wages*, page 326.) No, on the contrary, I believe that the feudal system was a great advance over slavery, and our present system is better in many respects than the preceding one. Each system was a necessary step in the evolutionary process that is preparing us for the coming age of universal co-operation. Nor is it true that I consider all efforts to improve present conditions wasted. On the contrary, while well aware that all such efforts must be mere palliatives while our present wasteful and anarchistic system continues. Yet, I welcome any movement in the direction of bettering present conditions, and would gladly advocate the adoption of the single tax did I not know it to be a mere will-o'-the-wisp that a good many well meaning men are chasing, not only wasting their time but actually retarding efforts towards real reform. It is greatly to be deplored that single taxers generally are content to remain ignorant of the works of economists that are changing the trend of economic thought and action throughout the world, while their leader can not in thirteen years active propaganda count even a solitary economist of note as a convert to his theories.

---

## IMMIGRATION AND EDUCATION.

BY ROBERT L. FULLER.

---

Since the question of immigration has presented itself for consideration, some of our ablest statesmen have made the assertion that there is ample room in the United States for 500,000,000 of people, or 435,000,000 more than we have at the present time, and that our only concern should be in regard to the character of the immigrants; that we do not want criminals or paupers; that we should raise the character of our immigrants but not reduce their number.

These gentlemen are partly right and partly wrong. We do not think the United States, except as a precaution against disease or contagion, has any right to say to any well-disposed, honest man, who is willing to come to this country to accept its government, to accept the responsibility of becoming a true and loyal American citizen, that he shall not come.

"The earth is the Lord's and the fullness thereof" and, under the original law, all men have a right to occupy any part of the unoccupied earth, whether it be in America, Asia or Africa. But, on the other hand, governments are bound to protect their citizens in the

exercise of all their rights; they are bound (at least morally) to prevent the occurrence of anything which has a direct tendency to lead to war or to riot. At the present time there are more workingmen in this country than there are situations for workingmen to get their living by, and, while at present we do not think we have a right to limit honest immigration, we do think that there should be such changes in the laws governing the education of the youth of this country as will fit them for the increasing competition which every year presents itself to the workingmen.

Labor saving machines have taken from the ordinary workingman, more than half his chances of obtaining employment.

When, out of wood, iron, steel and brass, something is made which will do the work of a thousand ordinary men, and do it with automatic exactness, then is notice served upon every nation of the earth that their only safety is to so equip their working forces that no labor saving machines can enter into competition with them. Then the problem of keeping away the undesirable classes which, for the last eighty years have been flocking to our shores, shall be solved. Still the main problem will not be solved until no boy or girl, with reasonable energy or pluck, will ever graduate from one of our schools without being able to do something which the world will want to have done so badly that it will pay for the service.

We declaim against the sinister classes of the Old World, and at the same time neglect to prepare our own men and women for the battle of life by educating them to a higher social, moral, and intellectual plane. Then our duty is only half performed, and the penalty for our negligence will be in the supporting of paupers, and the arresting and punishing of criminals; when had each generation but half done its duty, nine-tenths of the paupers and criminals of to-day would not be paupers and criminals.

---

## MR. STUART'S SINGLE TAX FALLACIES.

---

BY JAMES MIDDLETON.

No 5.

Before reviewing in detail, Mr. Stuart's attempt to show that the single tax would not increase wages, I wish to enter an emphatic protest against the grossly unjust manner in which he treats Henry George.

I do this the more freely as I have undertaken to defend, not Mr. Mr. George's views, but the Single Tax.

In my first article, I laid out my line of thought in these words:

In spite of all attacks, in spite of undue claims of its devotees, sometimes put forth; in spite of the weakness of some of the arguments they sometimes offer, faults into which its greatest living advocate, Henry George, may some-

L F M 5 July 98

times fall; in spite of all, it is believed in more widely than ever before, as the most just system of taxation for the present constitution of society, for all worthy classes whether rich or poor. The elimination of any one class of exploiters may not solve the economic problem, but it may be a long and necessary step in advance. Such I believe the tax on land values.

While I do not always agree with Mr. George, either in statement of economic principles nor in views of expediency in political action, I have a profound and growing esteem for him as one of the ablest and most practical champions that toiling humanity has ever had.

When Mr. Stuart devotes several pages of his article on the question, "Would the Single Tax advance wages?" in an attempt to make out Mr. George to be a shallow, ignorant writer, who maintains "that the landlords alone are able to live on the fruits of the labor of others," I must protest.

It is true that Mr. George has said, "whatever the increase of productive power, rent steadily tends to swallow up the gain and more than the gain;" but it is one thing to say that it "tends to swallow up the gain," and quite another thing to say that it does "swallow up the gain and more than the gain." The force of gravitation tends to draw everything to the center of the earth, but how much matter reaches that center?

That the landlord, under unrestricted private ownership, could take the whole surplus, could reduce all others to slavery, is something which Mr. Stuart practically admits when he denounces both landlord and capitalist as robbers, and says, the "economic system of the future will have no use at all for the capitalist any more than it will for the landowner."

That the landlord does not reduce all others to serfdom or slavery, is due to numberless causes, moral, economic and social, operating in countless ways to check selfishness and greed.

No one has pointed out more clearly than Mr. George, other robbers of labor. I will ask any one who doubts that to read Chapter IV, Book 3, of "Progress and Poverty" on "Spurious Capital and Profits, often mistaken for Interest;" "Protection and Free Trade," where he denounces the tariff; the Chapter in "Social Problems" on "Public Debt," in which he denounces our present form of funded debts and national banking system; and the chapter on "Functions of Government," in which he advocates government ownership of public franchises. The last paragraph of the Single Tax platform, which he wrote, and which was adopted at the National Conference of the Single Tax League, at New York, September 3, 1890, says:

With respect to monopolies, other than the monopoly of land, we hold that when free competition becomes impossible, as in telegraphs, railroads, water and gas supplies, etc., such business becomes a proper social function, which should be controlled and managed by and for the whole people concerned, through their proper government, local, state, or national, as may be."

Besides, Mr. George has been the most conspicuous advocate of the Australian ballot, and one of the first to publicly advocate it in this country.

I think I have shown conclusively that Mr. Stuart, by quoting a passage here and there removing it from its context, and ignoring other writings, has been grossly unjust to Henry George.

This bitter attack of Mr. Stuart on Mr. George, has nothing to do with the question, "Will the Single Tax increase wages?"

Mr. Stuart sums up his position regarding wages in these words:

For any lowering the cost of subsistence that might be affected by a decrease in the rent of land, any improvement in our fiscal policy, or by changes in our financial system; under the operation of the well-known "Iron Law" of wages, remuneration of labor must continue to depreciate to the minimum amount for which the laborer will continue the production of wealth.

No, gentlemen of the Single Tax, a scheme of economic reform that will leave the modern machinery of production and exchange in the hands of the minority of non-producers, while those who produce all wealth are left only a bare subsistence, will not do.

To prove that the capitalist will gain all that may be saved from a reduction of rent and a saving of taxation, he quotes largely from D. A. Wells, as to depreciation of agricultural rent at home and abroad, and the growth of bonanza farms in those cases where expensive labor-saving machinery may be used, as in the case of wheat.

He might have quoted from George, also, in "Progress and Poverty," (see p. 233, Lovell Ed.) "Social Problems," and elsewhere, to show the marked tendency "to the concentration of land ownership" in agriculture in this country.

While labor saving machinery is one cause of the growth of bonanza farming, it applies chiefly to wheat, oats, barley and rye. For nearly all other kinds of farming and fruit culture, it is an utterly inadequate explanation of the concentration and changes which are taking place.

Two great causes, as Mr. Wells has pointed out, are changes produced by cheap transportation and the protective tariff system. To this, George has clearly shown, must be added our whole system of indirect taxation. This whole system falls upon the consumer, and with the quasi-taxing power conferred upon the few, amounts to at least 20 % of consumption.

The little New England farmer has to pay not only his local taxes, which may be direct, but this other tax of 20 % on his consumption, as well. If the little farmer has to pay out all his income for living expenses, it makes 20 % of his income, or the whole of his possible saving, but for that tax. If the bonanza farmer expends only one-tenth of his income, his burden of indirect taxation amounts to but 2 % of his income. No wonder the little farmer is crowded to the wall.

Under a just system of taxation, the bonanza farmer's tax would be increased, holding, as he does, large tracts of land made valuable by our modern industrial development, while the burden of the small farmer, whether western or eastern, would be correspondingly diminished.

The modern bonanza farmer and modern developments of transportation and machinery furnish the strongest arguments for the Single Tax.

There is another thing that Mr. Stuart has overlooked, the tremendous increase of rents of city lands of manufacturing and commercial centers, and of franchises, that has accompanied, here and in England and Germany, the diminution of agricultural rents in

some localities, greatly increasing the total of rent which comes out of labor, as Mr. Stuart says, or rather out of the product of land and labor.

Mr. Stuart says of England, "The census report of 1881 shows that of the national product of wealth for that year, less than one-sixth was absorbed by land rent," which is greater than the public taxes, which are only about one-tenth of the product there. When we remember that a very few people own most of the land in England, this becomes important evidence in favor of the tax upon ground rent.

This estimate leaves out of account the values of the various franchises of England, which are properly rent charges, and go to swell the revenues of the few at the expense of the producers.

Says Mulhall, in his "History of Prices," page 51, published 1885, "Railway freights in Great Britain are 17 per cent. over the average on the Continent, and more than double those in the United States." "British industry is handicapped by excessive railway tariffs both for goods and passengers."

All of these rents, as Mr. Stuart says, come out of production. The greater the amount in a given annual product, the less there is for the other classes. The smaller the amount the more the producer may get and the better off will be the consumer.

Take from the Standard Oil Company, that Mr. Stuart refers to, the annual rental value of its oil lands for the benefit of the public by taxation, take from them the favors shown in transportation, and how could that company keep out its competitors?

Take from Carnegie the benefits of a protective tariff, and tax his coal and iron mines, and his manufacturing sites justly, under the Single Tax, and how could he rob his hired men on the one hand, or the consumer on the other?

The great permanent fortunes are all in land values and franchises, or stocks, bonds and mortgages based on the same, or special government privileges. Their power to hurt would be vastly diminished by abolishing protective tariffs and the adoption of the Single Tax. What farmer, what ordinary business man, what small manufacturer can wisely oppose it?

Fortunes made in speculation, unless invested in real estate and franchises directly, or indirectly in form of mortgages based upon the same, are but transitory. Where is "Old Hutch" to-day? What has become of the cordage trust? They are but an unpleasant memory.

When the Single Tax shall be adopted and railroad favoritism shall be destroyed, then the small farmer, east and west alike, will be freed from the burden of unjust taxation, which Mr. Stuart so studiously ignores, and will find a steady and profitable market for the crops for which his land and market are especially adapted, and can own or coöperate in the use of labor saving machinery.

But what has all this to do with the question of wages? A great deal, indirectly; yet, Mr. Stuart has not emphasized the connection. Though he starts out to answer that question, he gives scarcely any attention to the wage worker as such. He simply assumes that they

cannot share in the benefits of advancing civilization, following Ricardo and La Salle too closely.

I showed in my article on "Interest," that the reverse is true. Rent, wages and profits depend on the amount of the product. With an increase of production all three may increase. The amount that will go to each depends on the margin of production and the law of supply and demand. The amounts are affected much by taxation.

The study of English history and statistics is most instructive on these points. In Arnold Toynbee's "Industrial Revolution," Humboldt Library, Nos. 128 and 129, there is a vivid description of economic and social changes in Great Britain, from the middle of the last century up to 1880. Then wages were relatively high. They declined with almost uniform steadiness until the repeal of the Corn Laws, about 1843. From 1760 to 1843, nearly 7,000,000 acres of land were enclosed. Whereas, at the beginning of the eighteenth century, there were some 160,000 or more freeholders, by 1843 they had practically disappeared.

In the meanwhile, he says, (page 94.) "The problem of pauperism came upon men in its most terrible form." The following statistics will illustrate its growth:

Year.	Population.	Poor Rate.		Per head of Population.
1760	7,000,000	£1,250,000	or	3s 7d.
1784	8,000,000	2,000,000	or	5s
1803	9,000,000	4,077,000	or	8s 11d.
1818	11,876,000	7,870,000	or	13s 8d.

In 1818 pauperism reached its maximum.

He also says: "Between 1790 and 1815 rent doubled, interest doubled, wages fell." He also says: "As late as 1834 half the laborer's wages went in taxes." During that period a protective tariff held sway, and land, as such, was almost exempt from taxation.

By 1843 the condition of affairs was so intolerable for the working classes, both agricultural and artisan, that Robert Peel, the champion of protection, elected prime minister as such, became a free trader, and secured the repeal of the corn laws. During all this period landlords controlled legislation. From 1692 to the present the land tax has been four shillings in the pound of annual rental value of 1692. They have prevented any change in the assessment in two hundred years. It is true, if these lands are rented or bringing in an income they are subject to an income tax; but if they choose to have them idle, or converted into deer parks for their pleasure, they only pay on the assessment of 1692.

While numerous other causes were acting this is one great cause accounting for the growth of large estates, increase of rents and interest, lowering of wages, increase of poverty and crime up to the repeal of the corn laws. Nearly the whole burden of taxation was thus thrown upon the wage worker and other producers besides.

What followed the partial free trade introduced by Robert Peel? D. A. Wells, whom Mr. Stuart quotes; Robert Giffen, a president of the English Statistical Society, Mulhall, the world's greatest author-

ity on statistics, Toynbee and others who have carefully investigated, testify that production has increased tremendously and that the condition of the masses of Great Britain has correspondingly improved, and this in face of the fact that population has vastly increased.

I abbreviate from Robert Giffen's "Progress of the Working Classes." Since the repeal of the corn laws, 1843, wages have doubled while things to be purchased have cheapened except meat and rent. After deducting rent there is a great increase, and food consumption, especially of wheat and meat, has wonderfully increased. The increase of rent is due largely to better accommodations. Education has become well nigh universal; public libraries have been opened. In 1839, in England, there were 24,000 criminals; now 15,000. In 1849 England had 934,000 paupers; Ireland 620,000. In 1881 England had 803,000 paupers, though England's population had about doubled; Ireland but 109,000. Savings bank depositors have increased greatly as well as total deposits. Industrial and provident societies have had a corresponding development. Giffen says, "The 'poor' have thus had almost all the benefits of the great material advance of the last fifty years." With this increase in wages Mulhall shows that interest and discounts have markedly decreased.

The repeal of the protective tariffs enabled England to avail herself of cheap food, raising the margin of agricultural cultivation, diminishing farming rents. Yet wages of English agricultural laborers have shared in the great increase since 1843. If partial free trade has helped largely to these results what would be the result of complete free trade in England? If the great burden of indirect taxation on English industry could be laid on holders of lands, who, as Mr. Stuart says, now take "less than one-sixth of the product" and upon the holders of franchises, who hamper British industry with excessive charges, we could expect the disappearance of the residuum of society, the submerged tenth, the blot of our civilization, and the corresponding elevation of the masses.

These facts of history show, first, That the freedom from taxation which the single tax on land values, or absolute free trade will give will greatly stimulate production and raise the margin of cultivation, decreasing the rent and taxes individual wage workers and others will have to pay; Second, that the amount to be divided between wages and capital will be correspondingly increased; Third, that wages will be greatly increased, and the rate of profit will be diminished.

I would emphasize an especial reason for the third result, besides the law of supply and demand, or rather a modification of the law to the benefit of the wage worker and borrower. The capital of capitalists will consist chiefly of machinery, food, clothing, buildings, ships and other products of labor which must be constantly tended by labor even to be preserved, and which must be used by labor in order to give an increase. Labor creates all true capital and with access to vacant opportunities held by government (now monopolized by the few) on payment of bare rent in place of taxes, labor will have a marked advantage over capital. Capital will thus be-

come the servant of labor instead of labor, as now, being the servant of capital. Capitalists, through the very necessities of the nature of their capital, will be compelled to seek borrowers to use their capital, or laborers to make it productive; thus placing borrower and lender, wage worker and capitalist, upon a plain of equality, instituting the era of voluntary co-operation. Thus we have demonstrated, both by economic principles and historical facts, that wage workers and other producers will both gain greatly by the introduction of true free trade by means of a tax on the annual rental value of land and franchises sufficient to meet the needs of government.

In regard to the sufficiency of the single tax, to which Mr. Stuart refers toward the close of his article, he concedes what I contended for:

Mr. Middleton fears I overlooked the fact that under the single tax vacant lands cannot be occupied without payment of the assessed value to the state. I am glad to assure him that I quite agree with him, and also in the further fact that the adoption of the single tax will not destroy rent. I am pleased to make this admission, for Bro. Middleton appears to be truly grateful for any sort of admission that will tend to show any advantage of the single tax over the present conditions. However, he suggests a way out of the difficulty that I have myself elsewhere suggested, as an alternative plan, viz: For the government to hold present rental values of land (after this confiscation) to about present rates.

How can I help being grateful when he concedes what I am contending for? He concedes the vital part of my contention on sufficiency, and he ought to see that the reason I quoted Mr. Gros and Mr. Shearman is because their estimates are based on present values. I expressly disclaimed any knowledge of what rents might be in a perfect state of freedom. When Mr. Stuart says "Under such conditions," referring to George's ideal, "what the decrease in rent would be is only conjectural as to whether it would approximate to nearer to one-fourth or one-fortieth of the present rent," he shows that he himself does not know.

The lamented T. L. McCready claimed all rent was due to monopoly and would disappear in a perfect state of freedom. F. W. Walker, one of George's ablest and bitterest critics, claimed that George's tax would produce a revenue so great as to corrupt the state. *Land and Rent*, p. 139.

When Mr. Stuart says of the national product of England in 1881, "less than one-sixth was absorbed by land rent," he gives testimony of the sufficiency of present rents, as the local and national taxes of Great Britain are only about 10 per cent. of the annual product. The annual rental values of land and franchises in Great Britain must equal about 20 per cent. of the product or double the needs of government. Both in Great Britain and this country, we can, by the single tax, free labor or consumption from its whole present burden of taxation and, at the same time diminish present rents to the benefit of all, financially, except a few selfish monopolists.

I have thus met each of Mr. Stuart's objections, and have shown that they are not valid as against the single tax as the ideal method of raising the public revenues in our present constitution of society.

I await with interest his argument for complete state socialism.

# MECHANICAL.

---

## NEWSPAPER ENGINEERING CURIOSITIES.

---

BY THOMAS PRAY, JR.

---

It is entertaining sometimes to look away from your own mistakes to those of others, and if it is not exactly pleasant to be reminded of your own blunders, it is comforting to find that other people do make them and on critical examination it is perhaps natural to say, "What a bull!"—even if that does not help our own blunders.

Taking up a New York daily paper in May, I noticed the reason for the delay of one of the ocean steamships as given. It read something like this: "The steamship ——— was delayed for twenty-two hours at sea on the —nd or until the fires were allowed to go out, and the steam to drop and the engineers were puzzled to find where the trouble was, and after much searching and hard work, it was found that the vacuum had dropped off, and as soon as this was ascertained, steam was got up and the steamship proceeded on her way." Funny, that the class of engineers on our liners, who are certainly second to no men of that class, could not find out in one second that something was wrong with the vacuum; and as any good engineer knows, it would instantly be detected if there was no gauge on condenser and connections; and the loss of the vacuum is not so unimportant as to be unnoticed or neglected for a single minute, as the consequences are sometimes serious. But the trouble in this case was that the man who had the information given to him did not understand it or what it meant, and as he put it down he had to put it into his own way of expression and so it reached the eyes of men who should know, in a very curious form.

Another and more amusing instance was noticed on the report of the new train of twenty hours from New York to Chicago, on the Hudson River, New York Central and Lake Shore R. Rs., which came in on time May 29th into both cities, and in the report in the *Chicago Daily News* on that evening appears another newspaper man's ideas as to what will prove a stunner to railroad men. It is as follows: "Only an expert would appreciate the mechanical niceties that make up this wonder of locomotive construction, but the mention of a few details will prove of interest. The four wheels supporting the truck, and which form the drivers, weigh 80,000 pounds, while the truck itself weighs 40,000 pounds, the engine drivers are six feet and six inches in diameter, the boiler has 256 flues and a heating capacity 1,851.50 square feet, the tender carries

six and three-quarter tons of coal and 3,500 gallons of water and when loaded weighs 80,000 pounds, making the total weight of engine and tender 100 tons."

It will be entertaining reading to the men who know what the weight on the drivers is, as compared with this expert who gives the weight of the truck, of the wheels, and the contents of the tender, and then makes out the weight of all as 100 tons. Of course our readers will at once see what is meant: that the weight on the four drivers is 80,000 pounds and on the truck or pilot is 40,000 pounds and that the engine, tender, coal and water all weigh 100 tons which is a good weight to put on the rails to make the "old lady" attend to the business of pulling the train forty-nine miles an hour from New York to Chicago.

It is just this kind of so-called information that is found in sundry papers in our country. It is misleading, but it is the product of the country and of the same order as the "spread eagleism" or lack of truthful statement, but a disposition to "holler" instead of represent the fact, and rely on the statement as all that is necessary, but we must have the fastest train, and the biggest engine, and the president with the best salary on earth, and our driving wheels must turn the fastest and so on. It is not exactly a lie but it is a terrible stretch of the truth, and if we get into other countries and find that we are not so well posted as we thought we were, then it is real awkward to come back and say that we were too fast, and when our newspaper engineers and experts get the whole thing mixed up and topsy-turvy, it is time to get on our feet again.

There is quite too much of this same feature in our daily press, and too much of a disregard for the truth, but it is put forth ignorantly and with no sort of disregard for the facts, but it leads later on to a doubt of any statement in this class of papers, for a man who has found out that his statement was not right, when quoted, soon does as any one would under the same circumstances, simply discredits all and doubts the whole.

The plain fact is that so many men who know nothing, even if they care, are in a business where they are like a square peg in a round hole or a first class misfit (and they miss every thing but the salary), that it is difficult to get at facts, unless sifted through so many sources that it is expensive information and totally unreliable, but it is as certainly misleading, for those who read do not know as to its unauthenticity and so taking it for truth are deceived.

But if we digress for a little and let the newspaper engineer have a much needed rest and take up another part of the same article, that will interest newspaper men least and engineers and firemen more.

The same paper says that Chauncey M. Depew, the \$50,000 a year president of the Vanderbilt family, said to Engineer Mattie Regan: "It is something to pull the fastest train in the world, that will be something of a legacy to leave your family." But the same paper doesn't say that the great man paid Mattie Regan a fifty dollar bill to

put her over the iron. Oh, no; that is another sort of a trade, and if Engineer Mattie Regan, by any of the cheap employes of the great track, should run into trouble, and leave his life then and there, what a legacy for his wife and children! This is as ridiculous as the after dinner talk of the man who has honestly earned the name of the "after dinner buffoon," and his "speech" to Mattie Regan is as hollow as his pretended interest in the men who are at work on the road of which he is the nominal head as far as representation goes.

This is about the size of the encouragement that railroad men get. Talk is cheap, and the legacy of a man who has run for years is not of the making from cheap talk, and it is equally cheap if "spouted from a fifty thousand dollar geyser," so far as any possible value to its recipient. But no doubt the engineer pulled out better for being told he was to be famous because the great man had sent him out on the "fastest train in the world," but as a sensible fellow and a good engineer, he thought what he pleased and said "nothin'."

#### A NEW TOPIC FOR CONSIDERATION.

But to turn away from discouraging and unprofitable topics to a new or pleasant one, is no doubt, of interest to the thinking men of our number, so let us discuss the new and possible scheme of employing our talents, in considering the subject of faster travel by rail. It is possible to do so, and not cause the companies any expense, and if it is called for by the traveling public, then it will eventually prove profitable. To take up the possibilities of this is not the idea at this moment, but to draw thinking energy to it in all the different points of interest, and particularly as to what is to be improved in all the different respects as to track signals, or the rolling stock, and so many other of the vital points, with which every railroad man is familiar, and to which he can in his imagination turn, to study out what is to be done, and it is to be done soon, and there are plenty of things to be done, and on which the men have an equal opportunity to get in the work necessary to secure to themselves some of the profits of adaptation and acceptance. The brain is not controlled by salaries, nor is its use in the least monopolized by the higher officers of the corporations, and it is no use to sit down and say that nothing can be done to make ourselves better off, because some one has not succeeded in his efforts. The track is clear to all who enter and run with a will, and brains are at the top in all cases. But it is not the first or second effort that gets into the region of success, but it is the man who sticks, who tries and then tries some more, and he keeps on trying, and don't lie or sit down and stop, he just tries and tries, until some day he hits it on the head, and then the boys wonder how it happened.

If you wait for it to happen, you will grow old and gray, but if you keep trying and busy, it will come sooner and better, and the time does not hang on your hands when busy, as it would if idly waiting, for "suthin' to turn up." Rooting is another, if not an elegant expression for working, and the man who roots, if with a purpose, is sure to turn up a stump, stone, or some other cover for the

treasure that is hidden under it, but he would never find it without effort.

Chance doctrines may delude some men, but work is a thousand times better. If you are foolish in your saying as to luck, drop it at once and put in a P and then your ideas are of interest. "Luck for fools, but pluck for success."

---

## THE OLD AND THE NEW.

---

BY WILFRED P. BORLAND.

---

Whatever may be the evils of the capitalistic system of industry—and when viewed from a sociologic standpoint, they are many indeed—it cannot be denied that we are indebted to it for the vast improvements and inventions which mark the present epoch as unique in the world's history. When we consider the wonderful advances which have been made in the different branches of steam engineering within the present century, we are apt to entertain a feeling nearly akin to contempt for the genius of the ancients, and to contemplate ourselves with a feeling of superiority, because of the knowledge that the genius of our age has brought the mighty forces of nature within such wonderful subjection to the will of man.

But when we look at the matter philosophically, we shall be able to perceive that our superiority in this respect is due, not to greater genius, not to higher intellectual development, but solely to differences in social organization. We have positive evidence that, at least as early as 130 B. C., the power of steam as a motive force, was understood and had been experimented with; we cannot doubt that the genius who raised the pyramids, erected the Colossus of Rhodes, or stretched an awning over the coliseum, would have utilized this power had the motive to do so been present. The fact is, that in the economy of the ancients, there was no such thing as a motive for the invention of labor saving devices, hence, they were not invented. Labor was looked upon as degrading; everything was done by slaves, who were placed upon the same footing as the animals, and why should any one be at the trouble of inventing machines to lighten their toil? Aristotle, in his "Politics," classes all mechanics as natural slaves, and says:

"It is not, therefore, proper for any man of honor, or any citizen, or any one who engages in public affairs, to learn these servile employments without they have occasion for them for their own use, for otherwise, the distinction between master and slave would be lost."

And Cato gravely discusses, as a question of ethics, whether, in the event of it becoming necessary to lighten a boat in a storm, one

should throw overboard a slave who had lost his usefulness, or a valuable animal. When we come to examine the social organization of the ancient civilizations it is not hard to perceive the reason why they produced nothing but those grand works of architecture and art, which, in grandeur of conception, and delicacy of execution, we have never been able to even approach. Just as the laborer has achieved independence, just as the old barriers of servitude have been swept away, just as the principle of equal rights has been recognized, have the forces of nature been brought to the service of man, and there has been evolved the wonderful machines of the present day. So true is this, that one who is at all inclined to speculate on such matters, shall be able to touch the whole gamut of our present social development by studying the locomotive exhibit of the B. & O. Railway, at the World's Fair. This exhibit is designed to show the development of steam locomotion, from Newton's steam carriage of 1680, to the modern passenger locomotive of the present day. Newton's idea was very crude; he mounted a boiler upon a frame resting upon four wheels; a pipe, containing a plug valve, led backwards from the steam space, the passenger opened this valve and it was intended that the reactionary force of the steam upon the air would drive the carriage forward. It is needless to say that the carriage was not a success.

The next steam carriage was built in 1769, by Gugnot, a French army officer. It worked fairly well, and its inventor used to run it about the streets of Paris at the rate of three to four miles an hour; it did not meet with public approval however, and having tipped over one day while turning the corner of a street, the authorities seized upon it as a public nuisance and locked it up in the arsenal. The original machine is now in the museum of Arts, in Paris. The next is Murdock's steamer, made in England, in 1784, which was built mainly as an experiment, to determine the practicability of Watt's ideas concerning the running of carriages by steam. The honor of the next attempt belongs to America, and is illustrated by Nathan Read's road carriage, made in Salem, Mass. From this point the development is rapid, and all the attempts, from Newton's time to ours, are reproduced, either in the original or in the facsimile, in the B. & O's exhibit. These machines exactly mark the social development of the masses; they, as well as the numberless other inventions of the mechanic arts, are, in a double sense, the creation of labor; if labor had not emerged from its servitude and asserted its power, the machines would not be here, and we should be no farther ahead in this respect than were the ancients. That our inventions have been of vast service to all classes, no one but a rank pessimist will deny, but it is unmistakable that our unique development has already, in a measure, produced its antinomy, and, like the male bee of the hive, labor is often the miserable victim of its own creations. The next stage of development will abolish the antinomy and bring labor into the enjoyment of all the benefits which ought to proceed from the use of the things it is wholly responsible for producing.

## A NEW PLACE FOR THE FULCRUM.

BY WILFRED P. BORLAND.

Where is the fulcrum on a locomotive driving-wheel? is no new question to readers of this department, as it has been discussed in these columns both ably and exhaustively from at least two different points of view; but I am not aware that any one, on this side of the Atlantic, has succeeded in placing the fulcrum as it is placed by one of our English cousins, who contributes the following to the "Railway Review," of London, England:

*To the Editor:*

SIR:—"Loco," in his reply to "Figurative," said the fulcrum of an engine is at the center of the wheel. I contend it is not at the center of wheel for all parts of the stroke, but that it is at the crank when on the bottom quarter. To "Loco": Against which horn cheek is the axle box forced when steam is admitted against the front end of piston with big end on the bottom center? An answer to the above will oblige. Yours, etc.,

FIREMAN (Tyne Dock).

The argument which justifies the placing of the fulcrum at the crank-pin must be fearfully and wonderfully made; it is a pity we don't know what it is. There is an expression in that question, too, which would probably be a stumper to an American fireman; "horn cheeks" are not in our line of business.

The May MAGAZINE contained some comments on a supposed new invention for insuring the smokeless combustion of coal, which is being introduced in Germany. That very bright paper, *The Engineer*, punctures the new invention as follows:

[This latest invention has been a long time getting to Germany; it is over twenty years old here, and was tried on the 'Warrior,' a Sound boat and found wanting.]

Verily "there is nothing new under the sun."

Here is something from *Locomotive Engineering* that illustrates a phase of ignorance which is more common than is generally supposed:

A correspondent in Fargo, N. D., sends us the following scientific explanation (?) of the air-brakes: "The air-brakes of railroad cars work by air pressure. Pipes connected with the brakes are carried to an air-pump fitted on the side of the engine and keep up a vacuum in the brakes; when the brakes are to be applied, the air-pump is thrown out of gear, air is admitted to the pipes, and the springs of the brakes immediately press on them and bring them in contact with the wheels."

That item reminds me of a conversation between a locomotive fireman and his "country cousin," to which I happened to be a chance listener, about three years ago:

The "cousin" was in from the country on a visit, and the fireman was doing his best to astonish him with the wonderful sights around the engine house and machine shops. The two had stopped to ad-

mire a very handsome passenger engine, on the opposite side of which I chanced to be standing, when the "cousin," expressing astonishment at the wonderful power of the air-brake, and asking some questions of detail, it became necessary for the fireman to explain to him the difference between straight air and automatic. This is how he did it: "With straight air," he said, (I quote from memory) "we use a plain cylinder; the air is admitted behind the piston, which is forced to the opposite end of the cylinder thus setting the brake; but with automatic air there is a very powerful spring behind the piston, and air pressure is kept up in front of the piston, thus holding the piston back and compressing the spring; when they want to set the brake the air is let out of the cylinder, that releases the spring and the piston shoots to the other end of the cylinder thus setting the brake. That's the reason a train always stops when it breaks in two. "But," said the "cousin," pointing to the auxiliary reservoir, "what do they use that other cylinder for?" "Why, they use that to equalize the pressure," said the fireman.

The long-drawn "Oh!" from the "cousin" satisfied me that this explanation was, if not thoroughly intelligible, at least satisfactory. The fireman in question is an engineer now; I suppose he knows more about air-brakes than he did then; if not he will find himself in a fix some time or other when he least expects it.

---

### THE LOCOMOTIVE FIREMAN.

---

MR. EDITOR: It is doubtful if there is a man on the railroad train who is less appreciated than the fireman, and this little article is devoted to showing that he is a hard worked and unappreciated individual.

The public shakes hands with the conductor who has charge of the train, thanks the brakeman for many little courtesies, bows to the baggage master who looks after its luggage in transit, trusts its valuables with the express messenger, and talks long and loud of the "brave engineer." But the fireman, he who bends to his work and feeds the fire that makes the steam, is never mentioned.

Sometimes a purse is made up for the engineer. No one ever heard of a fireman getting a purse, but the records show that he has performed as many deeds of valor as the engineer. Again, if the train leaves the track or goes into another train, the fireman has fewer chances to escape than any man on the train, except, perhaps, the mail clerk, shut up like a rat in a cage.

When a fireman is at work, and that is nearly all the time when the wheels are turning, he stands, stooped over, shoveling in the fuel or raking the coals in the firebox; his view ahead is obstructed, and he cannot see the danger that may be dashing upon him.

The rattle and roar of the machinery may drown the engineer's warning call; a crash; the tender pins him to the boilerhead and he

is dead. Standing in the narrow gangway peering ahead, a sudden lurch around a curve may throw him off. Instances have been known when the coupling between the engine and tender parted, and the fireman dropped between them to be ground to pieces. The records show that more firemen than engineers are killed in railroad wrecks.

About the only time the fireman has a little leisure is when the train is running down grade. Then "she is shut off," steam is saved, and the knight of the shovel climbs up to a cushioned seat and takes a breathing spell. Even then, one eye is ahead, his hand on the bell-cord, and the other eye fastened on the steam gauge, whose little black hand, fluctuating back and forth, gauges his labor as well as his steam.

There is a science in feeding an engine, that is not understood by one not in the business. There is a way to throw in the coal, and to empty the shovel and close the furnace door at the same time.

It requires nice calculation that tells how many scoop loads are needed to send the hands on the gauge to the proper figure, deft handling to keep the deck of the cab clean, and a hundred other little things that go to make the skillful fireman—one that saves money for the company by husbanding the coal.

In the old days the fireman on wood-burners had a hard time of it, and certainly earned the small money he received for his services; but he had a sinecure, compared with the man in the blue overalls and jumper who stokes up one of the huge "moguls" of the present day.

These engines haul freight and eat up coal as if it were greased paper. The fireman is at work continuously, and about the only time he has to rest is when the train "takes a siding" to let a more aristocratic passenger train pass.—*Golden Days*, Jas. Elverson, Publisher, Philadelphia, Pa.

We have, so often, at times, in the past, protested against the injustice practiced by the general public and the public press, in practically ignoring the existence of the poor, hard-worked fireman, who, nevertheless, fills so important and indispensable a position on every train, that it is a pleasure to find an article like the above, in which he is given due credit for science and knowledge of how to furnish the steam to get over the road. The mouth of the press being now opened for once in his behalf, let us hope that Mr. Elverson's example may prove infectious and that we may, in the future, see the press and the public more ready and willing to give the fireman all the credit he merits.

Some years ago (indeed so long ago that it is likely none of the present generation of firemen were firing then) I saw a statement that a bet was made by a young man named Holly, that he could run a locomotive a mile on a level piece of track without water, fire or steam in her. The proposition seemed so absurd on the face of it, that when young Holly offered to make the bet he was quickly taken up, and a suitable piece of track having been selected at some little

distance from the round house, at the first favorable opportunity, young Holly, riding in state on his cold locomotive, was towed out to the place of trial. To the surprise of his opponents, by the time he got there, young Holly had somehow obtained the requisite power to run his mile and win the bet.

Now let us hear what your correspondents have to say on this. In the first place, is the story true? Can it be done? If it can, how can it be done? If you had been in Holly's place, how would you have arranged things on your locomotive to get the power you wanted? This may not seem practical, yet the underlying principle may often be useful in every day practice.

*William Weiler.*

---

### MORE ANSWERS TO KNAPP'S QUESTIONS.

MR. EDITOR:—As Mr. Garaghty has answered Mr. Knapp's questions, in part, I would like to say a few words on the same subject.

Is there no way to avoid placing the saddle pin back of center of link saddle? I think it could be placed in the center by giving more lap to one end of the valve.

In answer to Mr. Knapp's second question, I would say that the oil goes to the cylinder because there is a vacuum created there by the steam being condensed, and the steam pressure on the lubricator forces the oil to cylinder.

I differ from Mr. Garaghty in my ideas as to the proper answer to Mr. Knapp's third question.

I think that with twenty pounds of steam, injectors, tank valves, and hose air tight, the boiler could be filled by blowing off the steam and creating a vacuum in the boiler. The air in the tank would then force the water into the boiler.

I have known of one engine which if left to die without tank valve being shut off, would fill her boiler in that way.

I am only a fireman of a few year's experience, and am not at all positive about the correctness of these answers. I simply write to give my ideas.

NEVADA, MO.

*F. H. Watson.*

---

### SOME QUESTIONS.

MR. EDITOR:—Please publish the following questions in the Mechanical Department of the MAGAZINE:

1st. When a Monitor injector is working, and the heater cock is put clear down, will water still proceed on into the boiler?

2nd. Do the top and bottom guides wear alike?

3rd. Most engineers say a certain wedge is stuck, what do they mean? Does the wedge stick to box, or does the box stick to wedge?

By securing answers to the above questions you will greatly oblige me as well as others.

BIRMINGHAM, ALA.

*Francis O. Harvey.*

---

QUERY.

---

MR. EDITOR:—What is the mechanical answer to the question below?

What is the piston power of an engine?

*M. C. Martin.*

---

CLINKERS.

---

That aphorism of Crockett's "be sure you are right and then go ahead," contains about all the elements of a safe rule of action that any man needs in the philosophy of railroading; if enginemen would paste it on their hat bands there wouldn't be so many of them traveling around the country looking for a job.

The great trouble with many men is that they are afraid of "Mrs. Grundy;" afraid that their determination to know they are right before going ahead will be construed as over-timidity, ignorance or dampfoolishness, and they often subordinate their better judgment to the fear of the adverse criticism of their fellows.

The intensive railroading of the present day renders it imperative that a man must frequently work on a very small margin of safety if he would be a success; but it by no means follows, as is often the case, that he should, under any conceivable circumstance, abandon safety altogether.

There seems to be a feeling of egotism in the natures of most men, which they sometimes make great sacrifices to satisfy, and there is nothing makes an engineer feel better after he has made a bad break and come out of it safely, than to have the "con" pat him on the back, tell him he's a "daisy" and the only man who knows how to get 'em over the road in any kind of shape.

I'll admit that it is gratifying to be pointed out as the man who always "gets there Eli," and who isn't afraid to take chances now and then which other men wouldn't think of; but it is a mighty sight more creditable to be pointed out as an absolutely safe man, and the latter will generally be found holding down a good job somewhere while the former is traveling around the country "on his uppers."

Here are two circumstances which I have in mind: Some years ago, while firing for one of the best engineers I ever had any experience with, we were pulling an extra and it was desirable that we should make a certain meeting point for a passenger train. If we didn't make our meeting point we should have to lay back six miles and were sure to be laid out an hour or two in completing the run. We did our best, but when we came to the siding six miles from our meeting point we only had eleven minutes to make it. The engineer looked at his watch, made a motion to shut her off, then changed

his mind and pulled her wide open; when we cleared the last switch we had just ten minutes to make those six miles and get into clear. The track was all in our favor and we had good brakes, still it was twelve minutes before we were into clear at our meeting point. When we came to a stop on the siding the engineer heaved a great sigh of relief, and when the passenger train thundered by us, five minutes late, he turned to me and said: "I wouldn't take that chance again for all the railroads this side of hell."

About two weeks ago a certain engineer was pulling a west bound fast freight, which runs at night. The opposing train, which had rights, was behind time, and orders were issued to meet at a point some distance west of the regular meeting point. An extra, running ahead of the opposing train, made the same meeting point for the west bound train, and, approaching his meeting point and seeing the extra into clear all right, the engineer at once jumped to the conclusion that it was the regular which he had orders to meet there, and pulled her open and went sailing by to crash into the other train just around a curve about a mile west of his meeting point. Both engines were converted into scrap and the train crews escaped death simply by a miracle.

In the first instance, the engineer went ahead knowing he was wrong; in the second instance he went ahead without being sure he was right. Both cases are to be avoided; "be sure you are right and then go ahead" and you'll railroad a long time before getting into trouble.

---

It is noteworthy that the superfluous Nickel Plate road (N. Y. C. & St. L.), which was built in 1882 to sell out to the Vanderbilts, and after accomplishing the shrewd but not very lofty purpose of its projectors, has been kept alive as a freight tender of the Lake Shore road, has at last been put to use as part of a first-class through passenger train route between Boston, New York and Chicago. It is also notable that it is made the means whereby the Philadelphia & Reading and Fitchburg railroads are added to the list of trunk lines having through trains to the west.—*Railway Age*.

---

WE thought it was generally known by this time that an old piston in a fire is about as dangerous as a loaded shell, but it seems that parties in Chattanooga, Tenn., were not aware of it, for a piston in the blacksmith shop of the Cincinnati Southern Railroad Company exploded May 4th. The shop was totally wrecked and two men were instantly killed and three others hurt. The piston head was undergoing repairs. Where mineral oil is used the inside of the piston is coated with it, heating the same to remove the rod generates gas which is highly explosive.—*The Engineer*.

---

THE Lake Shore & Michigan Southern has notified its employes that they will be given vacations to attend the World's Fair, and passes will be furnished them and those dependent on them for support. A good example.—*Railway Age*.

THE fact that the Kansas railroad commission felt it necessary to formally rule "that railroad companies have a right to operate through trains for the accommodation of long distance passengers and can not be compelled to stop at small stations" suggests what may be one result of the new era of "granger legislation," which is about to be inaugurated in that state. Numerous little towns along the great railways from the Missouri river to Colorado had complained that the roads would not stop all trains at those points, unmindful of the fact that such stoppages would require the abandonment of fast through train service, and subordinate the advantage of the public generally to the convenience of the few. The commission took a broad view of the question, but the appointees of the new "populist" governor may not do likewise.—*Railway Age*.

AN interesting experiment has just been made on the London & Northwestern Railway with the engine Greater Britain with a view of testing the capabilities of that huge locomotive. Every day last week but one the engine made the journey from Euston to Carlisle and back, leaving Euston with the 10 A. M. express, and returning with the postal train at night, her daily run thus reaching an aggregate of 600 miles. The usual practice is to change engines at Crewe, but on these trips the Greater Britain brought the train all the way, only changing her driver and fireman at Crewe. In the week the engine covered 3,600 miles, drawing heavy trains, and ran fourteen hours a day at an average speed of between 45 and 50 miles an hour. This remarkable run was accomplished without a hitch of any kind.—*Railway Review (London)*.

IN the course of a report made to the general manager of the Cincinnati Southern on a test of simple and compound locomotives, Mr. James Meehan, superintendent of motive power, directs attention to the difference in evaporative power of good and inferior coal. He says the difference is 33 per cent. in favor of the good coal, and this is by no means offset by the difference in price. This is a subject that deserves much more consideration from railroad managers than it usually receives. It is quite common to find coal differing in heating power all the way from 25 to 50 per cent., and yet they will hesitate to pay 10 per cent. more for the superior coal.—*Locomotive Engineering*.

LAST summer the junior philosopher asked a Scotch engine driver if the company employed any "body-snatchers." He did not just know what "body-snatchers" were until it was explained that they were extra men who were sent to engines ordered out, to take them in case the regular man did not show up the required number of minutes before leaving time. "We dinna ha' the like," said he, "but we ha' the excise man." Then the j. p. was stuck. "Breath testers, mon," he explained, "them as see wha has gang adrift wi' John Barleycorn and lost the abeellity to gang awa' wi' their trains."—*Locomotive Engineering*.

THEY have curious ways of attending to engineering matters in China. A case was lately reported by a correspondent of *Engineering* where a river broke through its banks, inundating a large extent of country. The Emperor gave orders to the engineers of the district to close up the gap, and they did their best but failed. They were immediately stripped of their decorations and cast into prison. Another set of engineers were appointed; they succeeded in closing the breach and received great honors.—*Locomotive Engineering*.

CUBES of coal with faces five, seven and ten feet, respectively, will be exhibited at the World's Fair. They were mined at the same place in Logan County, W. Va., and are of different strata in the mountain.—*National Car and Locomotive Builder*.

ONE of the men who took an engine in the recent strike on the Ann Arbor road dropped the crown sheet of one of their new Mogul engines the other day, and the newspapers report that General Manager H. W. Ashley said of it:

"The explosion was caused by the crown sheet of the engine falling in, an accident in no wise the fault of the engineer and liable to happen on the best of roads."

It's something new to hear that engineers can't help the dropping of a crown sheet—they always get fired for it.

But if the Ann Arbor crown sheets are predisposed to this "falling in," we should advise the use of the famous vegetable preparation invented by the late lamented Mrs. Pinkham; or the employment of engineers—real live ones—has been known to stop it.—*Locomotive Engineering*.

SOME one has patented an invention which consists of deepening the needle beams of cars and making that a seat for the truss rods instead of the usual queen post. The patentee is already after some railroad companies for infringement. He ought to have some difficulty collecting the royalties. It is one of the most impudent patents we ever heard of being applied for. The practice of using the needle-beam as a queen post is nearly as old as car building. We are only surprised that some one does not get a patent on the diamond truck. Some combination could doubtless be devised that would be patentable, and superlative assurance on the part of an agent might lead some railroad managers to pay royalty for the sake of peace and quietness.—*Locomotive Engineering*.

It is claimed that the best time on record was made on the evening of November 18, on the Central railroad of New Jersey, by one of the large Vaucala compound passenger engines, which were illustrated and described in the *Journal* for June last. On the evening in question the engine, running with a regular train, consisting of a combination car, two day coaches and a Pullman car, ran one mile, near Fanwood, N. J., in 28 seconds, and the succeeding mile in 37 seconds; or at the rate of 94.74 and 97.80 miles per hour respectively. The engine had previously made a mile in 39 seconds. At the time of the run there was a high wind.—*B. R. and Eng. Journal*.

HENRY MEYER, a stationary engineer of Alton, Ill., is the inventor of a switch protection which provides for an iron cage over the switch stand. Into this cage the switchman must go in order to unlock the switch. The instant he throws the switch to the side track the cage closes and makes him a prisoner. He can only get out by throwing the switch back to the main track. An open switch in case of accident, will thus hold the party to blame where he can be found.—*National Car and Locomotive Builder*.

THE distance from Jersey City to Washington is 229 miles, and the fastest trains now cover it in five hours. Not satisfied with this rapid work the Pennsylvania railroad is said to contemplate a schedule of four and a half hours. This would require an average speed of 50 miles an hour without allowing for stops and slowing up through Baltimore and Philadelphia, and would be altogether a great performance.—*Railway Age*.

THE Chicago & Western Indiana have ordered 4 locomotives from Cooke's. The Chicago, Rock Island & Pacific have ordered from Baldwin's 6 ten-wheel engines and 6 Forney suburban engines, with three pairs of drivers connected and three pairs of tender wheels. The Baltimore & Ohio have ordered 50 engines from Baldwin's.—*Locomotive Engineering*.

ACCORDING to *Electrical Industries* 84 new electric railways have been built in the United States during the last year. The new roads and the extensions of old ones aggregate 1,530 miles. The number of electrical roads is now 469, with a total mileage of 5,446 miles and an aggregate capital of \$250,870,000.—*National Car and Locomotive Builder*.

THE Pennsylvania Railroad compound, built at Altoona, has been pulling trains for about two months, and has given entire satisfaction in every respect. The engine steams so freely and uses so little fuel that the intention is to use oil as fuel, and they are now putting on the necessary apparatus.—*Locomotive Engineering*.

THE discontented and ugly feeling on many of our Eastern roads among the engine crews could be permanently cured by the companies paying for overtime. The stealing of overtime by the companies is costing them dear and a day of reckoning is coming—better stave it off.—*Locomotive Engineering*.

THE best trains of the Great Northern of Ireland are lighted by electricity; there are four incandescent lights in each compartment. A storage battery system is used.—*Locomotive Engineering*.

### SOME THINGS TO REMEMBER.

The following questions and answers are taken from the *American Machinist*:

C. C., Cleveland, O., writes: Kindly enlighten me on one point of the valve motion, of which I am ignorant. We will suppose that the link motion of a valve is correct, could it be so arranged by setting the saddle pin out of center as to cause the steam to be cut off at the same point of the stroke for both ends of the cylinder? If so, would there be a perfect exhaust, or in other words, would the valves be square? A.—The saddle pin can and should be moved out of the center line of the link, towards the eccentrics, so that the steam will be cut off at equal distances from both ends of the cylinder. Under these conditions the exhaust will be practically perfect, or as the engineers would say, the valves will be square. Of course we assume here that the lifting shaft has been placed in the correct position, otherwise satisfactory results will not be obtained by simply moving the saddle pin out of the center of the link. 2. Again, if we divide the eccentric rods by the cut-off, say at 9 inches of the stroke of piston, would the point of release occur at the same point from each end of cylinder, and therefore have square valves? A.—The cut-off should in no wise influence the setting of the eccentric rods; these in connection with the eccentrics, are set simply to give the valve the correct relative motion to that of the piston. Any attempt to regulate the cut-off by the length of the eccentric rods will result in a distorted valve motion.

J. M., New York, writes; I have read in the press of the country on different occasions that a polished steel disk 6 inches diameter and 1 inch face, running at a speed of 6,000 revolutions per minute, will cut through any kind of metal. If such is the case I would like to know if a larger or smaller disk could not be used with like results; also who is the manufacturer of the machine? A.—Disks are frequently used for cutting metals, but we have not seen a disk 1 inch thick used for the purpose. For sawing any section of iron while cold the cold saw is sometimes used. This consists simply of a plain

soft steel or iron disk without teeth, about 42 inches diameter and  $\frac{1}{8}$  inch thick. The velocity of the circumference is about 15,000 feet per minute. One of these saws will saw through an ordinary steel rail cold in about one minute. In this saw the steel or iron is ground off by the friction of the disk, and is not cut as with the teeth of an ordinary saw. Reese's fusing disk is an application of the cold saw to cutting iron or steel in the form of bars, tubes, cylinders, etc., in which the piece to be cut is made to revolve at a slower rate of speed than the saw. By this means only a small surface of the bar to be cut is presented at a time to the circumference of the saw. The saw is about the same size as the cold saw above described, and is rotated at a velocity of about 25,000 feet per minute. The heat generated by the friction of this saw against the small surface of the bar rotated against it, is so great that the particles of iron or steel in the bar are actually fused, and the "sawdust" welds as it falls into a solid mass. This disk will cut either cast-iron, wrought-iron or steel. It will cut a bar of steel  $1\frac{3}{8}$  inch diameter in one minute, including the time of setting it in the machine, the bar being rotated about 200 turns per minute. See Appleton's Cyclopaedia of applied mechanics. These machines you can obtain from any dealer in machinists' tools and supplies.

J. D., Bluefield, W. Va., writes: I have to repair a certain locomotive fire-box by putting on the inside a patch with patch bolts; the patch is about two feet by three feet, of steel. Between the fire-box sheet and the patch I propose to put a piece of  $\frac{1}{8}$  inch copper. Now A. claims that the copper will cause the patch to burn away sooner than without the copper; B. claims that the copper will burn first. We leave the question whether the steel or copper will burn first for you to settle. A.—Practically, there will be no difference between the wear of the copper and steel as you propose to use them. If the patch is in a position which will not prevent the use of calking tools, a good boiler-maker would use no copper for making a tight joint, as the difference in expansion between the steel and copper may cause trouble.

G. G., Knoxville, Tenn., asks: What diameter of pipe would be necessary to blow off steam from a 40 horse-power boiler as fast as it is generated? Please give rule for computing this diameter? A.—The term horse-power in this case is very indefinite, and cannot be used as data from which the diameter of the escape pipe can be calculated. This diameter should be found from the grate surface. We should make the area of this pipe equal to that of a common safety valve. The United States regulations require that safety valves for ocean and river service shall have an area of not less than 1 square inch for each 2 square feet of grate surface, when the common safety valve is employed. If, for instance, the grate area is 16 square feet, then according to the above requirements, the area of the escape pipe should be  $\frac{1}{2}$ —8 square inches; the corresponding diameter is  $3\frac{1}{4}$  inches nearly.

H. C. S., Baltimore, Md., writes: Please define the meaning of a triple compound condensing engine. A.—A triple-expansion condensing engine is one in which the steam is expanded in three different stages, and after it leaves the low-pressure cylinder it is condensed. A triple-expansion engine has usually three cylinders, a high-pressure, intermediate-pressure, and low-pressure cylinder. The first stage of expansion takes place in the high-pressure cylinder; the second stage takes place in the intermediate cylinder, and the third in the low-pressure cylinder. Sometimes a triple-expansion engine has two low-pressure cylinders, in this case the third stage of expansion takes place in these two cylinders conjointly; or if the engine has two intermediate cylinders, the second stage of expansion takes place in these two cylinders.

And the following are taken from *Locomotive Engineering*:

A. P., Winslow, Ariz., writes: I am running an engine that is square when on track curving to the right, but when on opposite is quite lame. She is a ten-wheeler with double-rocker boxes. What is the probable cause of this?

A.—We don't know—some local cause. 2. When this engine is working full throttle, it is almost impossible to hold reverse lever when taken out of notch in quadrant. Valves, rocker-boxes and eccentrics have been examined, but the trouble has not been located. A.—The friction of the eccentric straps on the sheaves causes most of its "pull," and the angle of the links intensifies it at certain points of the revolution. Some engines, built with two rockers or with motion-bars are often almost unmanageable from this cause. We should like the experience of some one who has found the cause of the disease—and cured it.
